Doors and Factory Material

Dimension Bill Stuff in

Pine, Spruce and Hemlock

A full line of dry lumber in stock for prompt shipment. Let us give you our prices for anything you require in lumber.

Pine Doors

We have long appreciated the fact that price is not the only requisite a dealer must seek in placing his order for doors. Poorly manufactured doors can scarcely be considered a bargain at any price.

Door Making is our Specialty

We have equipped our plant with the best door machinery made, and we are turning out doors that **are right in quality and right in price.**

Our doors need no commendation. They prove themselves. They are business builders for every dealer who handles them.

If you have not received our latest quotations on Doors, Sash, and Interior Trim, write us to put you on our mailing list. It will be mutually advantageous.

440 Square Miles Timber Limits

on Georgian Bay

To be Sold by Private Sale in Large or Small Blocks.

On account of their President and Principal shareholders being engaged in other large enterprises, and not having the time to give to them all, THE PARRY SOUND LUMBER COMPANY, Limited, offer for sale all of the timber lands, mills and town property situated in the Town of Parry Sound; also Tug Scow and full Camp Equipment for five camps, including boom chains, snow plows, sleighs, etc.

THE LIMITS TO BE SOLD

comprise some 440 square miles of licensed and deeded Pine, Hemlock, Spruce, Birch and other timber. The licenses from the Ontario Government include all timbers and are not restricted for time. Government dues are as follows: Saw Logs, White Pine, $1.50 per M. ft., B.M. Saw Logs, Hemlock, Tamarac and other woods, 75c. per M. ft. The timber is situated in the Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street. The Canadian Pacific, Canadian Northern aud Grand Trunk Railways run through the limits, which makes some of the parcels offered for sale particularly desirable for small mill owners.

A circular giving full information, maps, terms and conditions of sale will be furnished upon application to

There are more DISSTON Brand Band and Circular Saws used than any other make and by a large majority

WHY?

Because millmen and sawyers recognize by the use of the Disston Saws they obtain the greatest results for the least cost

We make this statement without fear of successful contradiction

Points of Merit

Material Disston Crucible Steel
- Uniformity.
- Toughness.
- Greatest Tensile Strength and Elasticity.

Hardening AND Tempering Disston Method — Being manufacturers of our own steel, and thoroughly familiar with its make-up, we are able to absolutely adjust the hardening and tempering processes to the degree giving that perfect combination of hardness and toughness that produces the "edge, tension-holding and standing-up qualities" for which the DISSTON SAWS are renowned.

Grinding Disston Method — By the DISSTON METHOD all Band Saws are ground perfectly flat and uniform in thickness, thus making possible a very close adjustment of the guides without creating any friction or heat when in operation at the highest rate of feed; and all Circular Saws whether tapered or of even thickness are perfectly flat ground on the surface, thus insuring in all saws perfect clearance and true balance.

Tensioning Disston Method — The uniformity of the material, temper and grinding is a large factor in the proper adjustment of tension; and this, together with the Disston process of tensioning is the reason why the DISSTON SAWS will manufacture more lumber, under the same conditions than any other brand of saw.

In the DISSTON BRAND OF SAWS you have the advantages of the product of a progressive, up-to-date saw factory, the LARGEST IN THE WORLD, and where saws are made throughout, from the making of the steel itself —the superiority of which has been demonstrated for the past fifty-five years—to the finishing operation, each process being performed by mechanics of long experience and highest order of skill.

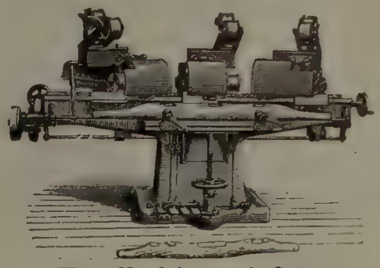
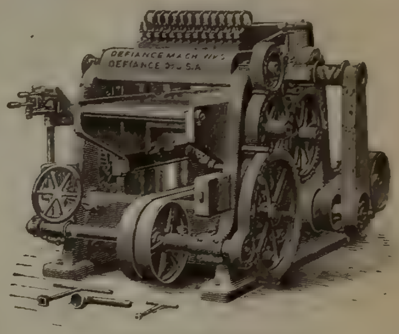
24-in. Hand Planer and Jointer

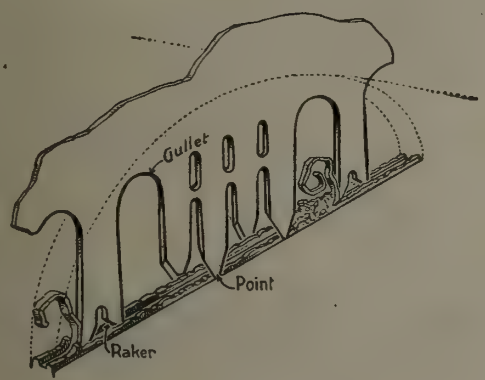


Three Head Automatic Gainer



26-in. Single Surfacer

THE DEFIANCE MACHINE WORKS, Defiance, Ohio, U.S.A.



Why Atkins Sterling Saws Run Free and Easy

Saws that depend on "set" for clearance have to tear their way through the timber, like the picture to the left. The teeth are sprawled out on either side and chatter and stick and bind and tear. That's why wood sawing is sometimes considered such hard work. That's why commonly ground saws can NOT run fast or pull easy.

ATKINS SEGMENT-GROUND CROSS-CUT SAW BLADES are ground thinnest on the center of the back. The teeth are the widest part, and the blade drops easily into the smooth cut which is made by the saw teeth. Very little set makes the teeth cut clean and the rakers clear the center. See the picture to the right. These Saws merely require enough power to pull them back and forth. That's why they run so easily.

ATKINS STERLING CROSS-CUT SAWS are the only Saws that are Segment-Ground, and for this reason are guaranteed to run easier and cut faster than any other Saws. Write us for free information, or order through your jobber or dealer. If they won't supply you, let us know.

MANUFACTURING WOODWORKING

Machine Knives, Circular Cutters and Mortise Chisel

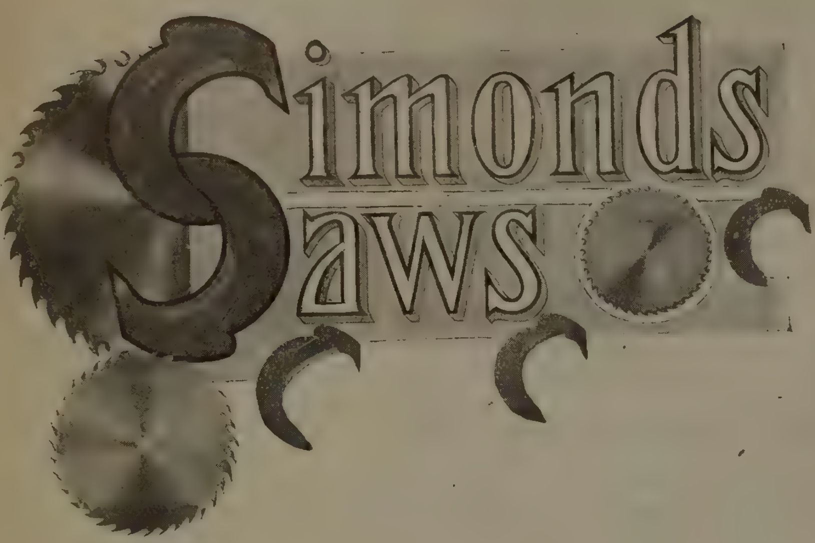
The patronage of Canadian consumers of Hardwood is most earnestly desired and respectfully solicited.

With our several mills and large stumpage holdings we are in position to produce good high grade stock, while our location is such that we can render exceptionally prompt service, and the favorable freight rates enable us to give splendid values.

Send us your enquiries and give us a trial.

John Dulweber & Co.

CINCINNATI, O.



As far as the cutting edge is concerned the Inserted Tooth Saw ought to show up best, for the reason that each tooth is a separate unit and can be made with a higher temper than the tooth which is solid with the plate.

Simonds Insertable Saw teeth are very finely and accurately machine milled (both bit and shank) to fit into the plate and they are brought to a high temper by a very skillful process—**this temper is always uniform.**

There is one kind of timber in sawing which Simonds Inserted Tooth Saws show a big lead and that is—frozen timber; one reason is that the points are held exceptionally firm in the plate by the Simonds way of insertion, so solid that they cannot spring sideways and cause the plate to dodge.

Again Simonds Points and Bits have a better clearance from the cutting edge both backward and downward than other makes of insertible bits—and the clearance is so uniform that Simonds Points may be worn down full length of swage without side filing or materially varying the width of kerf.

You know the name **Simonds**—now know the **Saw Simonds.** Every kind used in mill work, wood-working machinery and lumbering—Cross-cut, Gang, Band, Solid or Inserted Tooth Circular.
Your very next order should be for **Simonds Saws.**

TERMS OF SUBSCRIPTION:
Canada, United States and Great Britain, $2.00 per year in advance; other foreign countries embraced in the General Postal Union, $3.00.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 31 Toronto, January 1, 1911 No. 1

Duty on Lumber Urgently Needed

In a recent issue of "The Winnipeg Telegram" the editor of that paper took "The Canada Lumberman" to task for having claimed that there was a necessity for the imposition of a duty upon lumber entering Canada from foreign countries. Naturally enough, the Winnipeg Telegram, being the organ of a section of the population of Canada which is made up largely of retail merchants and consumers, takes alarm at what at first glance might appear to be a demand for protection for the sake simply of increasing profits. Either the Telegram, however, is unable to see the situation in its true light, or is determined to champion the cause of its readers irrespective of the justice of the case.

In the first place, the article referred to, claims that the lumbermen of Canada are able, "duty or no duty," to extract from the consumer a price sufficient to ensure a profit. This is not the truth. There is no duty to-day upon rough lumber entering Canada, and although some manufacturers have been making a small profit of late, the majority of the lumbermen of Canada have been operating under conditions which will not give them a return upon their investment, equal to that which can be made in other less risky lines of industry. The Telegram says this is the first intimation that the lumber interests have been operating at a loss. It may be the first intimation which has reached the ears of the editor of that paper at his office desk. If he had been travelling about the lumber manufacturing districts of Canada, however, he would have learned that the lumber industry to-day is face to face with a serious financial situation, which, a duty placed upon lumber entering the country can alone improve. If he were to visit the Maritime Provinces, he would find old established lumber interests, firms which have been carrying on a good business for half a century or more, seriously considering the advisability of closing their mills and allowing their plants to remain idle rather than continue business at a loss. He would find also, that within the last few months, more than one large company in the Maritime Provinces, employing great numbers of men, have been obliged to cease business. In Ontario, he would only need to spend about a week in the Georgian Bay district before he would have gathered indisputable evidence to prove that the lumbermen of that part of the country have anxious fears about the immediate future. About seven years ago there was an important sale of timber berths by the Ontario Government, and the prices paid at that time were inspired by the profits which had been made out of lumber in Ontario, in the last half of the nineteenth century. How unwarranted were these conceptions of the value of the timber has since been proved to the sorrow of many of those who invested at that sale. Of the large companies, which were manufacturing lumber in the Georgian Bay region at that time several have since gone out of existence. There is plenty of lumber still in that region, but it does not pay to cut it. An illustration of the situation is afforded by the attempted sale of the Parry Sound Lumber Company's limits and mill. On December 7 the company put all its property up at auction, and although the auctioneer was the well-known Mr. Peter Ryan, the same man who secured record prices for the Government seven years ago, he was unable to secure a single bid upon any of the limits or upon the mills or camp supplies. There were over a hundred men present, who were closely conversant with actual conditions in the country, but they remained silent throughout the attemptd sale.

In Western Canada, the conditions are more advantageous to the manufacturer than elsewhere, but even there, with their splendid timber, the lumber companies have been for the last few years manufacturing, in a great many cases, at an actual loss. Upon this subject it is interesting to learn the views of a man who has been a life-long lumberman,, and who is thoroughly in touch with the conditions existing today. Mr Peter Lund, managing director of the Crow's Nest Pass Lumber Company, of Wardner, B. C., in an article contributed to the Cranbrook Herald, discusses the condition of the industry in the mountain district of B. C. His opening opinion is as follows: "The business during the past year can scarcely be considered satisfactory. At the beginning of the year there was an apparent demand for all the lumber and lumber products, that were in the hands of the manufacturers, and a very satisfactory business continued until about July 1st, when owing to the excessive drought in the prairie provinces of Canada, and the unsatisfactory conditions existing among the American mills, which forced large quantities of foreign lumber into our markets, a decided change took place in the general conditions affecting the British Columbia manufacturers. Prices fell to a point considerably below the actual cost of production, and, owing to the arrangements made by the majority of the mills for a large output, there has been, in my opinion, over 100,000,000 feet of lumber sold during the present year at a price below the actual cost." Among the principal causes which Mr. Lund assigns for this depressed condition of the markets are: "the inadequate and unstable market," "a steady and continual increase in the cost of production," "the high carrying charge in the matter of ground rentals, royalties, etc," "lack of adequate protection against foreign competition," and "the heavy investments of capital required in the business." No more complete answer than the opinion of Mr. Lund, could be given to the claim that the lumbermen of Canada today are making large profits.

A Feast or a Famine: Further on in his article, Mr. Lund makes the suggestive remark that "lumber seems to be one of the few staple commodities that continue to fluctuate in price with every changing condition. In the lumber business it is either a feast or a famine." The unpleasant part of the situation to-day is, that the feasts seem to have been more frequent in the past, than in the last few years, and that they have given rise to a long-lived belief, that because the predecessors of the lumbermen of to-day enjoyed the feast and grew wealthy, the same must be true of those who have succeeded to the entertainment, who find themselves, however, feeding principally upon the crumbs which are left from the banqueting tables of their predecessors. It will probably be claimed that what the lumbermen of to-day are asking, would be protection enough to enable them to feast in the same prodigal manner. This, however, is not the case. What is needed, and is imperative, for the permanence of the industry, is, that the present condition of alternate feast and famine be altered into one of steady reasonable profit.

It is impossible for lumbermen to-day to continue long under existing conditions. There are only a few possible alternatives. If conditions continue unchanged, those in the business must be in continual fear of the arrival of a period of trade depression, which will force them to the wall, admitting others to profit by their losses, and for a short time make an uncertain profit, thus in a measure keeping the industry alive. Another alternative is, that the growing scarcity of lumber may improve conditions so as to enable everybody to do well. Under present conditions only a visionary or a confirmed partisan of the consumer, will hold such a view. A third alternative is, that the industry will come so rapidly to a condition of permanent depression that the Government, when it is too late to prevent a vast amount of unnecessary suffering, will learn that they have not treated this great industry either with fairness or manliness.

The Winnipeg Telegram by its partisanship is doing an injury to the whole country, and not the least to those whom it deludes into a belief that it is protecting their interests. The consumer of lumber is as much concerned in the stability of the industry as any one else, aside, of course, from those who are making their living in it. The collapse of the lumber industry, even in a partial measure, would have effects more calamitous upon the credit of the whole country, than a failure of the crops. We have lately seen a display of the interests of the farming section of the country at Ottawa, where one of the orators from the farm evoked applause by declaring in melodramatic fashion that the question of the day was not "what can parliament do for us, but what can we do to this parliament." This class of burlesque may not be without its effect in some quarters, but it is to be hoped that the industries of Canada, which depend upon protection for their very existence, will not be reduced to the precarious condition of the lumber industry, through fear of the threats of silver tongued farming orators. A more serious question far, than "what the farmers can do to the parliament of Canada," is, what will happen to the credit and commerce of the country, if the lumber industry fails to secure the protection which alone can place it in a position, commensurate with its importance.

A COMPARISON OF COSTS, on the score of an argument made by the Canada Lumberman, that the cost of labor and materials is greater in Canada than in the United States so far as the lumber industry is concerned, the Winnipeg Telegram makes another attack upon our accuracy In this case again, the editor of the Winnipeg paper displays a lack of familiarity with conditions which should have led him to leave the subject alone. Rather than increase the length of this article we will draw attention to a good answer to this claim, contained in a letter to "The Canada Lumberman" from Mr. W. A. Anstie, sec.-treas. of the Mountain Lumber Manufacturers' Association, which is published elsewhere in this issue.

"The Canada Lumberman" stated that the cost of operating in Canada was increased by the enforced idleness of the mills during the winter months, while the mills in many parts of the United States were able to continue sawing throughout the whole year and thereby to earn a continual profit on their capital outlay. The Winnipeg Telegram contradicts this, claiming that it is not true, and that the British Columbia operator is "as favorably situated as any other lumbering interest on the continent." Lumbermen will laugh at the ignorance which prompts a man to go into print with such nonsense. But they will not augh at the injury which such unscrupulous statements have been doing to their industry, for many years past. On the coast it *is* possible to continue sawing, on the average, for eleven months in the year. In the mountain district, however, from which a large portion of the lumber for the prairies comes, and which depends almost solely upon the prairies for the sale of its product, the average sawing season is only 200 days, the severity of the winter climate preventing them from sawing during the balance of the year. The Mountain mills are closed from November to April. Even on the coast, although they are able to operate their mills for a great portion of the year, the logging operations in the woods are curtailed to a very large extent by the wet weather. Unlike the East, the arrival of snow in the coast section of B. C., puts the logger out of business for the time being.

TAKING EVERYTHING INTO CONSIDERATION, which the Winnipeg Telegram has sought to prove in opposition to the imposition of a duty upon lumber, it is impossible to find one claim which they have made, that can be substantiated by the facts. Their article is a typical partisan utterance and is inspired by a spirit disloyal alike to the lumber industry and to Canada as a whole.

In conclusion let us make a suggestion, which, if it could be carried into effect, would do more to show the serious importance of this matter than any thing else that has ever been said or done. Suppose that instead of a deputation of farmers going to Ottawa, or a deputation of the lumber manufacturers of the country, it were possible to organize a deputation of the workingmen who secure their wages from the lumber industry. It would need no brilliant oratory to bring home to parliament and to the country, the critical condition at present existing.

Importance of Ontario Retailers' Organization

The movement among the retail lumber dealers of Ontario towards co-operation in their mutual trade interests, is one of the most encouraging features of the lumber trade which has occurred for some years. Ever since the lumber trade fell upon evil days a few years ago, when trade depression spread over the country, there has been a demoralized condition among the retail trade of the country. Ontario, as the largest consuming province of the Dominion has been the center of the most aggravated form of the disorder. The retailers have the key to the situation, and if they take a firm and united stand there is hope that a great improvement will spread throughout the trade and industry.

Lack of co-operation among the retailers has prevented them in the past from agitating for the correction of the evils which all have recognized. The movement for the formation of a provincial retailers' association should, therefore, not only be supported by all the trade, but should be assisted to the best of their ability by the wholesalers and manufacturers. A prominent wholesaler, in conversation with "The Canada Lumberman" recently said that he and several others whom he mentioned would be glad to take along with them on their travels, blank membership forms to be shown to retailers, with a request that they join the association and do their best to push it along. If a number of the well-known wholesale travellers were supplied with such forms, the whole retail trade could be personally canvassed and the great majority of them could be secured as active supporters. The holding of a series of meetings could be arranged for then, in such centers as London, Hamilton and Toronto, and the retailers would presently find themselves possessed of a great power for the benefit of the trade.

That the retailers possess the key to the situation, is admitted by those who have studied it. One of their first duties would be to draw up and insist upon, a series of grades for the sale of lumber. At present, a retailer never knows what he is buying, unless he deals exclusively with a few large firms, whose grades he understands and can depend upon. Otherwise he is buying a pig in a poke, everytime he gives an order to a traveller. The situation would not be quite so unsatisfactory, were it not for the fact that in addition to the bona-fide representatives of the responsible wholesale houses there are a great number of men selling lumber who know very little about the business and whose offices are under their hats. They secure orders for lumber, and cases are not scarce in which they make assurances that it will be delivered at prices which cannot be made by their principals. The order has then to be cancelled or someone has to seek to escape the consequences by means of mixing the grades. Every retailer is familiar with all the trouble which this causes. It is not a rare occurrence, but one which has become so frequent, as to be matter for continual complaint, and to make those who think about it wonder that the retailers have submitted to it for so long. The only reason for this, is, that there has been no means in the past whereby the retailers could get together and concert unitedly for its removal. They have that opportunity now, and will have to bear most of the blame for future trade troubles if they do not take advantage of it.

What would be the result if the retailers of Ontario were to demand that the lumber they ordered should grade up to certain standards? Wholesalers would recognize that they must provide the lumber as ordered and would pass the demand along to the manufacturer. Manufacturers of Ontario have shown an inclination in the past to grade their lumber up to reasonable standards, but as there has been no recognized standard grading, each has been a rule unto himself and the result has been confusion. They would not be long in conforming to a request of this nature, if it were backed up by a united and influential association of retailers. There is no great reason why the grades of lumber in Ontario should not be standardized. The grading of the hardwoods in the United States—a much more intricate problem—has been effectively accomplished. The manufacturers of Ontario have sometimes talked the matter over, but they have lacked the stimulus of necessity, and nothing has been done. That stimulus can be supplied by the retailers and they owe it to the whole trade and industry to make a stand.

Not only would the grading difficulty be removed by this means, but other troubles could be remedied. A serious drawback to successful trade is the lack of business ethics which now prevail. Wholesalers are loud in their complaints that they find the retailer and the manufacturer coming together and cutting them out of their legitimate business. A wholesaler in Toronto, recently had practically secured an order for the lumber for a large factory building. He was on the point of making up the cars, when he received word that the lumber had been secured elsewhere. From investigation he learned that a large mill had sold the lumber to the contractor direct. Under particular circumstances this will be defended, but there ought to be a fellowship among the different branches of the trade, which would reduce it to a mimimum and enable each to do a fair business, without the continual fear that he may be undersold by the very parties from whom he would secure his wholesale supplies. The manufacturer would benefit as much as the retailer, and on the whole, even the consumer would come out even. There is unquestionably a large field of activity for the retailers of Ontario if they can come together.

Quebec Pulpwood Controversey Reaches a New Stage

United States Consul Willrich, of Quebec, has drawn the fire of Mr. John Norris, the well-known public advocate of the paper consumers of the United States, by his recent reports upon the available supply of pulpwood in the province of Quebec, which, he claims, is not effected by the recent act prohibiting the export of pulpwood cut from the Crown lands of the Province. Many Canadians, who are conversant with the conditions existing in the province of Quebec, are convinced that Mr. Willrich was either misinformed or that he was not fully conversant with the subject, when he penned his recent reports. It is scarcely probable, however, that a man who has served his country for a long time in the capacity of a Consul in a foreign country, would have purposely suppressed important facts, which he had been provided with by official authorities, as is charged by Mr. Norris, in a letter which he recently wrote to Hon. H. C. Emery, Chairman of the United States Tariff Board.

Whatever the facts of the case may be, however, it is interesting to note the charges which are made by Mr. Norris. He considers, first of all, the assertion made by Mr. Willrich that substantially all the needs of the American market, viz., 1,000,000 cords of pulpwood per annum could be obtained from the private forests of Quebec. Mr. Norris claims that the data which Mr. Willrich is accused of having suppressed, indicate that only 330,000 cords per annum would, under present restrictions, be available for the American Market, after the wood now cut shall have been used. The so-called private forests, Mr. Norris says, which are not subject to the prohibition of the export of pulp wood, measure approximately 7,800 square miles, or less than one-twentieth of the total forest area; that is 5 per cent., and the available pulp wood in the so-called private forests, he says, is less than that which one American concern, the Internation Paper Company, controls in various localities. "Is it not ridiculus," he asks, "to maintain that the withdrawal of nineteen-twentieths of the forest area of Quebec as a source of supply for our mills need not restrict our supply?" It really does seem ridiculous, and for this reason, we cannot but believe that Mr. Willrich would never have made such a claim, if he had at the same time been suppressing statistics which would prove that he was wrong.

Another point made by Mr. Norris in his letter is that in March, 1907, a paper panic was produced in the United States, simply by the purchase by Wisconsin mills of 50,000 cords of pulp wood, or only one-seventh of the total cut in Quebec. This panic, he claims added $6,000,000 to the annual cost of paper used by American newspapers. "Is there not a serious situation confronting us then?" he asks, "when 95 per cent of the available sources of wood supply is withdrawn."

Another argument which Mr. Norris makes, is that one-half of the private forests of the province of Quebec are in hardwoods; that is, maple orchards, producing maple sap or sugar. "No deduction," he continues, "was made for the fact that part of the area is inaccessable for shipping purposes, and that nine-tenths of the territory had been ruthlessly cut over for other woods, and that the eastern section had been exhausted. "The average of 10 cords to the acre, which was made by Mr. Willrich, is claimed by Mr. Norris, to be excessive, the accepted basis of calculation being 5 cords to the acre.

The burden of all this, and of much more that Mr. Norris charges, is, that the United States Government by publishing Mr. Willrich's reports is extending favoritism to the paper mill owners of the United States, who have been favored already with a substantial duty upon paper coming into that country from foreign countries. He charges further that these mills have combined in various ways to extort profits on a fictitious capitalization of plants which are only fit for the scrap heap. The purpose of this argument is evidently to show that the paper mills do not need protection upon their product, and as the protection complained of is believed by Mr. Norris and his friends to have been responsible for the course adopted by the government of Quebec in prohibiting the export of pulp wood, it is clear that by hitting at Consul Willrich's report, it is hoped to have some revenge upon the paper manufacturers.

Canadians cannot help feeling that all this hard feeling is based upon a mistaken view of the situation. The government of Quebec came to the conclusion, just as many of the people of the province had come to a conclusion long previous, that it was necessary to protect the pulp wood resources of the province from extinction, by preventing pulp wood from being exported to feed paper mills in foreign countries. That the step was taken at a time when it could be construed into an act of retaliation for the imposition by the United States of a duty upon paper entering that country, is unfortunate, but does not affect the case, nor could it ever be imagined that even if the duty upon paper were now removed by the United States, the people of Quebec would consent to a return to the old conditions under which their natural resources were exploited for the benefit of a foreign people.

An instructive side light upon the whole situation which seems to have been overlooked both by Mr. Willrich and Mr. Norris is the recent utterance of Hon. Jules Allard, Minister of Crown Lands of the Province of Quebec, who stated that the legislation prohibiting the export of pulp wood cut from Crown Lands was having its effect. Several prominent paper manufacturers of the United States were already negotiating several new mills would be established. This was the effect for which the measure was passed: viz., the encouragement of the paper-making industry in Quebec.

Passing of the Square Timber Trade

Changes Which Have Been Wrought by Time and the Industry of Man in the Ottawa Valley Lumber Trade—Statistics of Production

An Old Pine Monarch.

There is nothing quite so full of interest in the history of the lumber industry in Canada as the contrast between the sawn lumber business of to-day and the old square timber industry which preceded it, and which for about twenty or thirty years was one of the most prosperous and extensive industries which have ever existed in Canada. One will not have lived long in the city of Ottawa before he hears of Philemon Wright. There is something about the name of this early pioneer of the Ottawa Valley which suggests the romance and the hardship of the days when the people of Canada were obliged to earn every dollar they made, by the sweat of their brows. Philemon Wright was a pioneer of the most realistic type. His life was one of hard work and adventure, and to him is due the credit of having been the first man to translate into deeds his faith in the timber wealth of the Ottawa Valley.

There is no great amount of mystery or uncertainty about the beginnings of the timber industry of the Ottawa Valley. So far as legislation is concerned, the ancestor of the timber laws which have spread themselves over the statute books of the Dominion and the Provinces of late years, was an act passed in the year 1808, for the better regulation of the lumber trade, which opened with the following words of wisdom: "Whereas lumber is become an article of importance in the export trade of this Province, and it would tend to increase its growing reputation to the great advantage of trade if the quality and measurement thereof were properly ascertained." There had been other Acts dealing with the timber industry, of course, but they were remarkable more for their lack of concern about the industry than for their intelligent appreciation of its future greatness. During the French regime the timber resources of Canada were looked upon as of comparatively little importance. From a revenue point of view they were scarcely recognized. They were treated, in fact, as merely incidental to the general land policy of the Government. About the only value which the French Government of that day saw in the timber of Canada was that it would be useful for the building of navies. They accordingly required the seigneurs to preserve, within their land grants, "the oak timber fit for the building of vessels." The pine and other woods were not considered to be of any value. Under the British Government a somewhat similar policy was observed for a time, but it was soon found that the pine was useful for ship's masts. From the day when this discovery was made the pine timber industry of Canada had its beginning. From that day to this, the lumber jack has been going into the woods each winter and pushing back the line of the great pine forest, until to-day, just about an even century from the date when the first inroads upon the forest were made, we are beginning to wonder how much longer the depleted forest will last, and to take active steps to prevent its total destruction.

During the century which has intervened between the arrival of Philemon Wright at the place where the city of Hull now stands, and the present day, the lumber industry has gone through great changes. From a primitive industry in which practically every operation was performed by hand, it has developed until to-day, with few exceptions, every operation is performed by machinery. In the woods operations alone, machinery has made little headway, but there are many indications that in the near future there will be only a few of the operations in the woods which are not also conducted by machinery. But the introduction of machinery in the lumber business has been coincident merely with the same course of events in other industries.

The most important and interesting development in the Ottawa Valley lumber industry has been the rise and decline of the square timber business, and the change from the manufacture of square timber to that of sawn lumber. A report recently published by the Department of Public Works gives an interesting summary of the change. After referring to the origin of the square timber trade the article gives a number of interesting facts about the changes which subsequently occurred.

A comparison of exports, commencing with the year 1850 up to 1909, illustrates the changed conditions under which the forest supplies are sent to the European markets.

In the earlier part of the last century, the entire export of Quebec pine was in the form of timber in the squared log, hewn with the axe, and floated down to Quebec merchants, who put the timber in shipping order by butting and dressing it at the Quebec shipping coves, disposing of the culls locally for wharf building and other similar purposes. The greater part of the timber so received and shipped was white pine, squared to a sharp edge on the four corners; deals were made for export to other countries, and only reached the English market in the character of stowage deals. The square logs (and later on waney) were converted into planks and boards at the various sawmills in the great towns in England, and in county yards, pit-sawing was largely in vogue for log conversion. In 1861, waney pine was made for the first time, this wood being left with a wane of from three to six inches on the corners, so avoiding the excessive waste of wood resulting from hewing the timber exactly square. Previous to this, the timber was square and of large average, beautifully hewn by the lumbermen in the woods; but board (waney) pine, that is, short logs of large girth, were sent down the drives with the other timber, and soon found their way into the market. Being cut from the lower part of the tree accounted for the waney character of the logs, but the quality of the timber was excellent. It gradually almost altogether supplanted square pine. The following comparison illustrates this point:

Year.	Square pine.	Waney pine.	Total.
1861....	15,731,000 c. ft.	6,735,000 c. ft....	22,466,000
1909....	66,200 c. ft.	699,360 c. ft....	765,560

While the decline in the quantity of square and waney pine made for the Quebec market was to some extent due to the scarcity of suitable trees to manufacture into timber, it was in a far greater degree attributable to the increase in the deal and board trade. Gradually the produce of the sawmill took the place, for export, of timber in the hewn log. In the Ottawa region a large proportion of the trees are suitable to make deal logs, but would not be large enough to be made into waney board pine. This is exemplified by the smallness of the square pine that was latterly taken down from Ottawa. In former days square pine was made 70, 80 and even 100 feet cube average; lately, it was with difficulty that 40 feet average cube was procurable in square pine, and the waney board pine is decreasing in girth annually. Formerly, 20 inches and over, average cube, was easily had. As late as 1904, 17-inch average was as large as most manufacturers would undertake to supply, and they frequently fell below this average on delivery at Quebec.

The main cause of the decline in the timber trade, large sawmills were operated for many years at Montmorency, the water power of the falls running the mills. There were also several other sawmills operated by steam and water power adjacent to Quebec or within a short distance of that city. For many of these mills, rafts of round pine logs were brought from the Gatineau and other limts. At Hawkesbury, the Hamilton mills (now owned by the Hawkesbury Lumber Company) and the Gilmour & Company's mills at Chelsea, produced large quantities of deals for export, which were rafted down to Quebec, and shipped either wet as "floated deal' or after being landed and piled as "dry floated deals."

Raft of Waney and Square Timber.

Present conditions are entirely different; the trade in hewn timber has gradually diminished, and seems to have almost come to an end, so far as the Ottawa country is concerned. The Montmorency mills have been dismantled long ago, like most of the other mills in the vicinity of Quebec and the Gilmour mills at Chelsea, have been demolished and the practice of floating deals to Quebec has disappeared.

The Hawkesbury mills still exist, but cut principally white pine lumber, that is, boards two inches and under, in thickness, for the United States market; the limited quantity of deals now cut at these mills goes to Montreal by rail or barge for shipment by ocean steamers loading at that port. Quite a large quantity of deals is manufactured by the larger mills in the Ottawa district, such as those of J. R. Booth, McLachlin Bros., W. C. Edwards & Co., Gilmour & Hughson, the Shepard & Morse Lumber Company, and others.

Shooting the Slides—In the Square Timber Days.

As deals took the place of timber, so lumber is gradually supplanting deals for export. The sawn white pine exported is manufactured by Ottawa Valley and western mills, and shipped from Montreal as being nearer the point of production.

This change from the manufacture of timber hewed square in the woods to the bringing of it to the mills in the form of round logs, has effected a very important saving of the very best material, formerly left in the woods in the form of chips cut in the process of squaring the trees, which were useless for any purpose except that of spreading the vast forest fires that have destroyed many times more timber than ever was cut with the axe.

The change from sailing vessels to steamer for ocean carriage has necessarily affected Quebec as a shipping port for wood goods, as steamers charge no more on freight from Montreal than from Quebec, and, as a matter of fact, prefer the first named port as being under more favorable condition. Montreal also has the advantage of being nearer most of the mills that now produce pine lumber and deals, as they are generally west of it, and the freight by barge or rail is much less than to Quebec.

Thus the export business in wood has changed from hewn timber made with the axe and floated down to Quebec in rafts, with a limited proportion of deals sawn at Quebec mills or floated to Quebec from Hawkesbury or Chelsea on the Gatineau to a small export of timber from Quebec where hewn timber can best be handled on account of the facilities given by the tides and an export of sawn lumber including some deals from Montreal. A considerable proportion of the reduced quantity of timber now shipped comes from the United States, which is the source of all the oak exported, and most of the elm. The supply of oak suitable for export is exhausted in Canada and the supply of elm is rapidly tending in that direction. Another change is that of shipping by steamer instead of by sailing ship. These two factors account for the loss of the squared timber trade by Quebec and Levis, which was inevitable, but some authorities say it was accelerated by the restrictions imposed and the wages exacted by the Quebec ship laborers.

Before leaving this subject, it may be interesting to say a few words about the price the lumberman received at Quebec for his timber. No record is at hand earlier than the year 1841.

In the settlement of an account between a Quebec merchant and an old lumber manufacturer, however, a raft of square pine, 70 cubic feet average is valued at 3d. (5c.) per foot. In recent years, waney timber 18-inch average has brought as much as 80 cents per cubic foot and square pine 30 to 40 feet average, 40 to 50 cents per foot, a vast advance from the 5c. of 1841 or the 4 1-2d. of 1846.

Doubtless the great prices paid for timber limits, higher timber duties levied by the provincial government and the growing scarcity of large timber, all account for much of the increase in value to the producer, which is practically six times as much as it was in 1862, in which year it is of record that square timber could not be produced and delivered at Quebec under 7 1-2d. or 12 1-2 cents per foot.

The relative positions of the square and the waney pine industries during the period from 1845 to 1909, are shown in concise form in the above table prepared by the Collector of Public Works Revenue:

YEAR.	SUPPLY.			EXPORT.	STOCKS.		
	Square.	Waney	Total.	Square and Waney.	Square.	Waney.	Total.
1845	24,223,000		24,223,000				
1846	24,242,689		24,242,689				
1847	19,060,880		19,060,880				
1848	17,402,360		17,402,360				
1849	18,581,560		18,581,560				
1850	14,398,000		14,398,000	13,040,000	5,046,000		5,046,000

1909	66,200	699,360	765,560				

If one wished to trace the lumber industry of the Ottawa Valley to its earliest beginnings, he would have to go back to the days of the French Revolution. So thoroughly was the commerce of the Baltic disorganized by these protracted wars that the countries from which England drew most of its timber supplies were closed to English merchandise. England began to feel the need for timber and hemp, and

The Stuff that made Square Timber Famous.

Canada, the country so despised by English politicians of the day, came to the front with considerable supplies of both. Philemon Wright, in his earliest days on the Ottawa, commenced the manufacture of both timber and hemp, but he soon abandoned the manufacture of the latter.

The first raft of square timber floated down the Ottawa River left the mouth of the Gatineau River, on the 11th June, 1806, and reached Montreal in 28 days, having run the Long Sault and Carillon Rapids in safety, passed Montreal by the Back River and down the St. Lawrence to Quebec, and before nine years the timber trade of the Ottawa was firmly established. From 1806 till the imposition of a timber duty on exportation, in 1823, there are no authentic records available.

In the early days of the trade, the mode of constructing a raft was so crude and the apparatus so primitive. though displaying great ingenuity, that, to the navigator of late years, it seems almost incredible that with such appliances the timber was successfully taken through the rapids named on the Ottawa River and weathered the frequent rough seas on Lake St. Peter; the mooring apparatus consisted of wooden anchors and cables made of withes (twisted birch saplings) the only propelling powers being the winds, the currents and the oars of the raft's crew, which oars were about 24 feet long hewed out of small trees; hence two seasons were often consumed in getting a raft to Quebec, while the same trip could now be made in four weeks or a little less, for rafts have been delivered in Quebec early in July, having traversed the 600 miles from Lake Temiskaming since the last days of April.

In the early days, as in late years, a raft was composed of a number of cribs, which were built up thus: A frame of the desired dimensions was made of small flatted timber, bound together at the corners by wooden pegs and often further secured by withes, then the longest and straightest timber was selected for the bottom of the crib, stability was then secured by placing on the top of several pieces of traverses (being small flat timber placed across the timber in the frame and fastened to it also by withes), four or five rows of square timber, which latter were known as loading sticks; by the weight of these the timbers in the bottom of the crib were kept almost solid in place, nevertheless it was not unusual when running a rapid, that striking sunken rocks, the bottom sticks would slip and the crib be wrecked; as the cribs were completed they were secured together, by withe ropes, in oblong form, and were then termed a raft.

The wooden anchors were made of oak, shaped somewhat like a grappling iron, with large chain withes passed through the different forks, encircling a stone of such dimensions as was deemed sufficient to answer the purpose and could be handled. This stone was secured within by interweaving other smaller withes about it, and continuing them until they connected with the main cable, also constructed of withes, and it is a matter of history that these primitive anchors answered every purpose to the rafts of those early times, that their more durable and powerful successors subsequently served, in later years.

As the timber became scarce in the region where the trade originated, operators had to resort to the country above the Chaudiere Falls, hence the necessity arose of providing some means of getting the timber safely past this and other similar places on the Ottawa River.

(To be Continued.)

Hardwood Outlook—Scarcity and Waste

Economic Condition of the Industry Unsatisfactory—Activity in Business and Anxiety About Stocks, the Outstanding Features of the Situation

It requires neither prescience nor even expert knowledge of hardwood affairs to state that the economic conditions surrounding the hardwood industry are not good, says the Hardwood Record.

Generally speaking, the last stand of virgin hardwood timber growing in the United States is in the hands of operators or very close to their possession. The stand of timber is in a limited area, and, as compared with the high class timber that has already been cut, is of a poorer quality. In quantity remaining it is infinitesimal as compared with the great area that has been stripped of its growth.

The beginning of the end of hardwood stumpage is in sight. Good timber areas showing a reasonable stand of maple, birch, basswood and elm in the north are very scarce and are held at high prices. In the south desirable tracts of oak, poplar, hickory and ash are equally unobtainable at anything save a very high stumpage value. There remains in reasonable supply to-day considerable red and tupelo gum stumpage and some other minor varieties of woods. The country is in a decadence of good hardwood timber supply.

When it can safely be estimated that fully 25 per cent. of the hardwood timber stand in most operating sections is still left in the woods, unutilized, and when fully 40 per cent. of the total hardwoods manufactured are produced at or below the price realized for them, and that 60 per cent. of the total production has to bear the burden of cost and profit, it is perfectly safe to reiterate that the general economic conditions surrounding the hardwood industry are not what they should be.

If there was ever a time in the history of a trade when strenuous efforts ought to be pursued for the logical realization of the now wasted residue of the forest, and for working out problems of utilization and securing a profit from the 40 per cent. of low grade now produced, the time is now.

A review of the year's business in hardwood production and sale shows that the production of the year in all varieties of hardwoods has been somewhat less than normal, says the Chicago Hardwood Record. Business was in fairly good volume and prices very satisfactory for the first six months of the year. During the latter part of the year there was a notable bulge in high-grade poplar values and a satisfactory accretion in prices obtained for both quartered and plain oak. Maple and birch also showed an increased value which has been sustained during the entire year.

During midsummer hardwood sales dropped off to the usual dullness, and business since has not shown an average normal strength, although trade commenced to improve in October and has followed in a satisfactory volume up until the last ten days, when the holiday and inventory season has again caused a diminution of business.

The wet summer in the south materially interfered with production, and the output in the lower Mississippi Valley was considerably restricted for several months. Prevailing illness among operators also had its effect towards disseminating mill crews and decreasing output.

During the latter half of the year some few items of lumber have shown a little diminution of prices, notably poplar automobile panel stock, owing to decreased orders from the automobile trade, and quarter-sawed oak, attributable to a considerable overstock beyond current demand. However, the general run of lumber values has been fully maintained and in some instances shows a handsome increase over a year ago.

Right now trade is manifestly quiet and it is expected to remain so until after the first of the year.

The furniture trade will not make its purchases of lumber until after the January exposition sales period is passed, when it can estimate the quantity of lumber that will be required.

The railroads are still restricting orders to a marked degree, awaiting the result of negotiations for higher freight rates. Many railroads are employing this policy of non-purchase as a lever to influence the Interstate Commerce Commission in its decisions. It is well known that the majority of railroads are in urgent need of ties, timber and lumber supplies generally, but are placing no material orders that they can possibly avoid. The steel industry, notably in the sale of rails, is handicapped by the same motives.

General building throughout the chief commercial centres of the country is going on at nearly maximum tide, which results in a very good trade for hardwood doors, interior finish and hardwood flooring.

The furniture business is moderate in extent and the factories are buying only for present needs, although many advance orders are offered for veneers and panels on account of the low range of prices asked for these commodities.

The trade in foreign woods is normal and featureless.

Prospects for increased and satisfactory trade for the first of the year are excellent, and in spite of the slight commercial unrest that still prevails, it is more than likely that, considering the manifest shortage of dry stock in first hands, the accelerated prices of stumpage and the prospects of increased general business, a very satisfactory and profitable hardwood business will develop not later than February 1.

The Trend in Flooring

To use a sporting-page figure of speech, flooring has been in training for some some now to reduce weight. Or, rather, to reduce its girth. The tendency has been toward narrower strips in all kinds of flooring except 6-inch No. 2 common used for sub-flooring. Just as the old 6-inch standard stock gave way to 4-inch, so is the 4-inch giving way to 3-inch, and then comes the oak flooring people setting a pace that at first looks rather startling as compared to the old flooring dimensions. The oak flooring people are advovating the use of very narrow strips and pointing with pride to 1½-inch face. Moreover, it is found that lots of 1½-inch face is being used in oak flooring, and it looks so well in an average room in a house that architects are inclined to specify it and builders to call for it. This is coming down in size a whole lot, even for hardwood flooring, and it looks like a very radical change, indeed, when we compare it to the old standards in pine.

It is really not out of line, however, because pine is settling down in higher grades to about 2¼-inch face, and with pine on this basis it is perfectly in harmony to see oak and other hardwood come down to 1½-inch face.

Taking the pine flooring business as a whole, the tendency in the No. 1 common is toward 3¼-inch face; in the B and better it is 2¼, whereas, in the low grade, there is still a clinging to the old 6-inch stock.

It is causing a little shifting in the demand, too, especially in some sections. There is not so heavy a demand for the No. 1 common in 4-inch stock that formally existed, but the trade is going more to the upper grades in narrow widths of pine and to a heavy volume of low-grade in 6-inch stock. The low grade is used for a sub-floor on which to lay hardwood and even at times when high-grade pine is laid there is a sub-floor first made of low grade. Inthis the 6-inch widths seem to be a sort of accepted standard. Consequently, there has been in some sections of the country a pretty heavy volume of business in low-grade 6-inch flooring.

In the hardwood flooring, which is the center of attention by critical builders right now, there is manifested a disposition to eliminate many of the odd widths and odd thicknesses. It is contended by the oak flooring people that two thicknesses are all that are really needed and that the keeping alive and using of other thicknesses is more notion than business reason. The two thicknesses are ⅜ and 3-16. This simplifies the manufacture, as all the flooring can then be made from standard inch boards from thin stock by resawing, and the other by using straight; and it also simplifies the carrying of stock in retailers' sheds. So, unless there is some specific reason to urge it, for this ½ and ⅝ are liable to be things of the past in the near future. In widths there is the same disposition to eliminate the odd and freak sizes. It is contended that 1½, 2, and 2¼ inch face is all that there is need for. The 1½ usually runs in halls and in dwellings and the 2¼ for larger public buildings and halls.

This, they say, will cover the whole range of flooring requirements and furnish a pleasing appearance to the eye while at the same time insuring a floor comparatively free from unsightly cracks, because there can be only the minimum of shrinkage when the narrow strips are used.

In parquetry there are some new borders offering from time to time and some disposition on the part of different builders to lay their own peculiar patterns, otherwise the work remains practically the same and the volume of business in parquetry seems to be increasing and keeping step fairly well with the progress of hardwood flooring generally. Now and then one meets up with a man who claims to be an authority on building matters who says parquetry is a thing of the past and belongs in the class with scroll brackets and other gingerbread work on porches and cornices, and does not properly belong in the architectural scheme of the present day. This attitude, however, is not borne out from among the parquetry manufacturers themselves, because practically all of them seem to be busy and even some oak flooring people who heretofore have made only straight flooring stock are adding parquetry here and there along with it, because many people, when they build a new home, want the hall and parlor in parquetry and the other rooms in hardwood flooring.

In every kind of flooring the tendency is very strong toward a higher order of selection and workmanship all the way through. We have passed away from the day of carpets covering the entire floor. Rugs are regarded as more satisfactory and more sanitary and with a part of the floor showing bare there is a natural tendency to refine it and make it in keeping with the balance of the millwork in the house. And because of this tendency, when a man is using yellow pine, maple, oak, or beech, he generally uses a better grade of stock, has it manufactured in small units an dkeeps it in better order than in the old days.—St. Louis Lumberman.

Deficiency in Measure—The New Law

English Spruce Importers Consider it an Unfortunate Change — Lack of Responsibility for Shortage a Serious Matter

The recent act passed by the Dominion Government regarding responsibility for deficiency in the measurement of cargoes carried on vessels, closely effects the spruce importers of Great Britain. The Timber Trades Journal, of London, Eng., discussing the subject says:—

"Quite recently a measure has been passed by the Canadian Parliament which will affect to a considerable extent the relations hitherto existing between shippers and merchants on the one hand and shipowners on the other with regard to the shipment of wood goods, and more particularly of spruce from Canadian ports. The enactment, which is known as "The Water Carriage of Goods Act," came into force on September 1st, section 10 reading as follows:—

' "In cases of wood goods, notwithstanding anything in the charter party, bill of lading, or other shipping document, the owner, charterer, master, or agent of the ship, or the ship itself, shall only be bound to deliver to the consignee the pieces received from the shipper, and shall not be held responsibile for deficiency in measurement; and any words inserted in any charter party, bill of lading, or other shipping document for the purpose of making the owner, charterer, master, or agent of the ship, or the ship itself, liable for deficiency in measurement in such case shall be illegal, null and void and of no effect." ' By section 3 the Act is to apply inter alia to ships carrying goods from any port in Canada to any port outside of Canada, and by section 5 every bill of lading or charter must incorporate a reference to the Act. Section 12 provides a fine for neglect of observance of any of the provisions of the Act not exceeding one thousand dollars.

"The branch of the wood mainly affected by the new legislation, as we have already remarked, is the spruce trade, but to fully comprehend the nature of the changes set up some retrospect of the English law regarding the responsibilty of the ship-owner with regard to goods comprised in a bill of lading is necessary. Although by the Bills of Lading Act a bill of lading is always conclusive evidence as against the master who signs same, it is not in the absence of express stipulations binding upon his owners; the Courts having held that a master possessing only authority as an agent is not in a position to bind his owners by signing for goods in excess of those received. In case of a claim for shortage, therefore, upon the captain proving that he has delivered at the port of discharge all the cargo handed to him, no claim for shortage could be sustained. This expression of the law obviously weakened the value of the bill of lading as a negotiable document, and to get over the difficulty it has been the practice to insert clauses in the charter parties, by which owners bind themselves to accept bill of lading figures as conclusive. These clauses have varied according to the class of goods carried; the usual wording in the case of a spruce charter party being as follows:—

' "Bill of Lading to be conclusive evidence against the owners as establishing quantity delivered to ship. The captain's or agent's signature to be accepted in all cases as binding on owners." ' In the wood trade the word "quantity" has a relation both to number of pieces and measure, and in 1902 the Court of Appeal had, in Mediterranean S.S. Company vs. Mackay, to consider some important points arising out of the insertion in the charter party of the "Pocahontas," of a clause in the above terms. The facts were comparatively simple. The bill of lading of the cargo gave the number of pieces of deals and battens and the number of superficial feet, and the like particulars of scantlings, deal ends and boards respectively. The bill of lading also gave the total number of pieces and of superficial feet. There was a short delivery of deals, but an over delivery, which was taken over by the consignees, of scantlings and boards, the total number of pieces delivered being slightly in excess of the total number given in the bill of lading. In an action by the shipowner to recover freight, in which the consignees counter-claimed for the value of the deals not delivered, the Court of Appeal held that the bill of lading was conclusive as to the number of pieces and the number of superficial feet in each class of timber, and that the consignees were entitled to a deduction on freight in the proportion that the number of pieces of deal not delivered bore to the number specified in the bill of lading. It was held also, that the defendants were entitled on their counter-claim to recover the value of the deals not deliverd. This case, which was fought on behalf of the Federated Merchant Freighters' Association, raised a good deal of comment at the time. Its apologists have contended that if the shipowner contracts to make himself liable for the statements contained in the bill of lading, it is only reasonable that he should be held to his bargain.

"Whatever view may be held of the 'Pocahontas case, it must be said that legally it has governed the settlement of practically all lower port spruce freights to this country for a matter of eight years. Now—presumably at the instigation of Canadian shipowners who are largely interested in the transport of spruce—the Canadian Government has so far intervened as to render the insertion in the contract of affrightment of a clause making the shipowner responsible for measure, an offence punishable by a serious fine. Moreover, the shipowner's responsibility under the above law is to extend only "to deliver to the consignee of the number of pieces received from the shipper." At Canadian law the bill of lading will, therefore, be inconclusive even as to pieces, seeing that it is not in itself conclusive evidence, but only, by Section 9, prima facie evidence of the number of pieces received from the shipper.

"In its general aspect a feature in the new Canadian law which strikes us as unfortunate is the leaning exhibited towards government interference in matters of business between parties of full contractual capacity—the more so as no questions of monopoly or public weal are here involved. Assuming, for the sake of argument, that the "Pocahontas" case dealt harshly with the shipowner, the obvious remedy lay at hand in an alteration of the terms of affreightment. To invoke the aid of the Commonwealth in such circumstances implied the confession of a lack of bargaining capacity hardly creditable to the instigators of the new legislation. What the trade on this side will do in the altered circumstances we cannot tell. Variations in specifications and shortages in the measurements of spruce cargoes are fairly regular incidents in the life of an importer who handles spruce. As it will be no longer possible to include a conclusive evidence clause as to measure in spruce charter parties, importers in future will either have to bear such losses themselves or seek indemnity from shippers. On the other hand, shippers will naturally object to be saddled with a liability which they have hitherto escaped. We suggest that an effort should be made to bring about a conference between agents and importers to decide what ought to be done under the altered circumstances which have been brought about by the new enactment on the part of the Dominion of Canada."

The decision of the Safety Board of St. John, N.B., in favor of leasing to the Partington Pulp & Paper Company, lots at Union Point adjoining the pulp mill, is generally approved. The management is preparing to make extensive additions to the property, including the erection of a large paper mill, and needs the lands for that purpose.

Reciprocity Would Be Dangerous

Free Trade in Lumber Would Involve Destruction of Forests —Timely Treatment of the Situation by Dr. B. E. Fernow

"With the data available it is impossible for any one to make an estimate of the total timber resources of the Dominion or of any portion like the pulpwood, on which much reliance may be placed.

"All that it is possible to do is to figure on probabilities or possibilities, taking into account the character of forest growth in various parts and applying experience figures—more or less well based guesses.

"One method of procedure in making such guesses, which I have followed in the main, is to circumscribe areas known to embrace certain types of forest growth. The Geological Survey has furnished a map on which the limits of certain tree species are laid down. While, of course, not accurate, for the purpose in hand this furnishes one useful basis.

"Thus the northern limit of the two commercial pines, the white and red, limit the area within which commercial timber is located in the Eastern Provinces. The area within which the great western commercial timber tree—the Douglas fir—is found, can also be circumscribed as nearly limiting commercial forest areas of the Pacific Coast. Other similar data of species distribution and climatic conditions permit further subdivision and differentiation in forest types.

"In this way I have located on a large map 13 types of country or, leaving out the forestless or sparsely forested prairie types, 10 types of forest country, which can be roughly measured.

"Other data help to further correct these areas. It is known that north of the Height of Land pine occurs only in narrow belts along river courses, hence the Height of Land which is more accurately located can be assumed as the limit of commercial area.

"The farm area is approximately known and can be deducted. Experience figures can be applied to deduct for waste lands in different types.

Waste Land in Nova Scotia

"In Nova Scotia for instance the waste land per cent. is found near 35. There is knowledge as to amounts standing or cut from whole sections of country which permit to figure averages applicable generally. In Nova Scotia on some two and one-quarter million of actual forest, 2,500 feet per acre were still found. On the licensed area of Ontario (15 million acres), the total cut and the estimated remaining stand makes the average 2,000 feet. So that we can safely say that applying 2,000 feet to the entire commercial forest area of the eastern provinces must be an extravagant estimate.

"This area measures out roundly 100 million acres; the farm area reduces it by around 25 million acres, and an allowance for waste land of one-third brings it to 50 million acres of timber cut over and otherwise.

"If we apply the experience figures above cited we would come to the conclusion that probably 100 billion feet is more than what will be found on this area, and 200 billion must be far beyond the possibilities. It should, of course, not be forgotten that standards change, estimates of timber therefore from this cause alone are liable to vary.

"Any one at all familiar with climatic and soil conditions of the north-western territories and provinces will come to the conclusion that the timber to be found there—as far as it is not yet burned up—has commercial value only for local consumption. It is most important to have it reserved for such local use as the settlement of the region progresses.

"The vast territory of 1,600,000,000 acres extent is scantily enough wooded. The estimate on 10 million acres of forest reserves, presumably located in better parts comes to less than 500 feet and 7 cords fuel wood per acre, showing that commercial areas are probably rare.

The Rocky Mountains

"In the Rocky Mountain country the area of commercial timber can be in a similar manner circumscribed as containing 15 million acres, which at 5M per acre, would be extravagantly estimated to furnish 75 million feet.

"The coast forest of British Columbia can be divided into two sections, the southern, which represents the magnificent Douglas fir, containing about 15 million acres, may in anticipation of a reduction standard size of logs to Eastern conditions be figured at 15M feet or 225 billion feet. In the northern section, where the fir drops out, another 15 million acres may swell this total to 300 billion feet. The dry interior is presumably in the same condition as regards wood supplies, as the northwestern territories.

"We come then to the conclusion that an estimate of 500 to 600 billion feet on the less than 100 million acres of commercial timber land is probably quite an extravagant figure.

"I have several times attempted to revise my guesses and every time have found reasons to reduce them. I doubt now whether even the lower figure of 500 billion feet can be found on the territory included.

Supply of Pulpwood

"An attempt to estimate pulpwood is still more uncertain in results. For Ontario an estimate made in the Crown Lands Department places the average per acre for the province at large at around 2 cords per acre.

"If this figure were applied to the whole 400 million acres of country in the Eastern Provinces, including the territory north of the Height of Land, we would find the most extravagant amount of 800 million cords, that is 8 cords per acre of what we believe actual forest area—a figure not likely to be accepted by those familiar with pulpwood conditions. I am free to guess that not one-quarter of this amount will be available.

"Moreover, it should be understood that much, if not most, of this pulpwood is not spruce but fir, which presents difficulties in its transportation.

Reciprocity Means Free Entry

"While as a general proposition I consider reciprocity a desirable end in establishing commercial relations between Canada and the United States, from the standpoint of a conservative use of the timber resources of Canada reciprocity would in my opinion be hardly a benefit, unless a radical change in the management of Canadian timber limits were to take place first. The supposition, of course, is that reciprocity means free entrance of lumber and wood goods into the United States. What must the effect be: an increased market, hence increased exploitation. We would merely get rid of the lumber in a shorter time, and as fast as development of means of transportation admits. How fast may be judged from the mathematical calculation that the present annual consumption of lumber in the United States could not be supplied from Canadian limits, if our extravagant figures are near the truth for more than 10 to 12 years.

"If each province had a really strong and properly manned forestry department, which were managing—not merely handing over for exploitations—and were gauging the cut, not according to the quantity which can be annually marketed, but according to the capacity of reproduction of cut areas, that is to say, working for continuity, reciprocity would, of course, be a blessing."

Representatives of the pulp and paper industries of Canada held a meeting recently at Ottawa, and decided to organize an association with a view to protecting and promoting the interests of the industries. There was considerable discussion regarding the tariff on paper and the general opinion was that in case any movement were made in the direction of a lowering of the tariff on coated and surface papers, a strong campaign in opposition to it should be conducted.

Why a Duty is Needed on Lumber

Factors Which Enable U. S. Mills to Dump Their Low Grades Upon Canadian Markets—By W. A. Anstie

The necessity for a duty upon lumber entering Canada has been assailed of late from several quarters, and it is of much interest, therefore, to read the views of a man who has made a close study of conditions in the lumber industry of the mountain district of British Columbia. Mr. W. A. Anstie, secretary-treasurer of the Mountain Lumber Manufacturers' Association, in a letter to the Canada Lumberman. deals with a number of the important aspects of the case in the following letter:

Editor CANADA LUMBERMAN:

In regard to the relative cost of stumpage and manufacture of lumber in British Columbia and in Washington, Oregon, Idaho and Montana:

In the first place, I contend that, with the exception of white pine, good stumpage in British Columbia, which is accessible to present transportation facilities, is worth and commands as much money, as in the States mentioned. For example, a large deal involving several billions of timber was recently made in my district on the basis of $1.00 a thousand stumpage. The Canadian Pacific Railway, owners of large tracts of timber in southeastern British Columbia, have a minimum price of $2.00 per thousand on all their standing timber. All our large operators to-day value their stumpage at $2.00 a thousand, and while some might sell for less than that, they would consider they were doing so at a sacrifice. What I have said about the interior applies equally to the coast.

The Government of this province have placed a reserve upon all unalienated Crown timber lands, and there is absolutely no legislation on our statute books to-day whereby a timber limit can be acquired from provincial Crown lands.

With regard to the cost of operation, I would say that in the first place it costs from 30 to 35 per cent. more to build and equip a modern sawmill in the Province of British Columbia than it does in the States mentioned. This applies also to our logging railroads. Owing to the physical nature of this province, the difficulties of developing productive timber are much greater than in the States to the south of us, where the valleys are wider. Thus our logging costs are materially increased.

I think you are sufficiently familiar with this subject to know that when I say the cost of building mills and railroads in British Columbia is so much greater than in the States to the south of us, it is due to the fact that our machinery and supplies are all protected with a high tariff, and whether or not we use Canadian machinery—as we are doing practically exclusively to-day—the increased ratio of cost is the same. You are probably aware that in the mountain district of British Columbia the 10-hour milling capacity is 25 per cent. greater than at the coast; but owing to the fact of our average sawing season being only 200 days, due to the severity of our winter climate, our annual production falls below that of the coast, where the average sawing season is eleven months.

Re labor: I have had occasion to make comparison of the cost of labor in the mountain district, as compared with interior Washington, Oregon, Idaho and Montana, and find that our wages average 35 per cent. higher than in the territory referred to. It is claimed that at the coast, where a considerable number of Orientals are employed, the cost of labor is lower than in the coast-American States; but it is well-known that the efficiency of this Oriental labor is lower, and, consequently, I do not believe that anything is saved by its use. Practical lumbermen having financial interests on both sides of the line—as many of our people do—have informed me that the cost of manufacture on Puget Sound, for instance, is lower than in British Columbia, in spite of our much-advertised "cheap Oriental labor."

I think one of the greatest arguments that you can make for a duty on rough lumber entering Canada is the fact that our American competitors use our market for a dumping ground for their surplus low-grade product. This is well-known to all those who are conversant with conditions of the lumber trade in the West. Their prices on boards, dimension and timbers show conclusively that every consideration of profit is eliminated when they make their periodical raids into our territory. The prices which they are making this year will not return them, after the freight is paid, as much as the logs cost British Columbia manufacturers. The Western-American lumber-producing States have been suffering from over-production for several years, and it is not fair that they should be allowed to demoralize our market, as they have been doing for some time past.

There is one phase of this question which our prairie friends seem entirely to ignore, and which, if they were more broad-minded, would inure greatly to their benefit. In their selfish demand for "cheap lumber" they overlook the inter-provincial interests, which, if recognized, should certainly cause a broader view to be taken of the question. I refer to the fact that in the prosperity of the lumber industry of British Columbia, the Province of Alberta has a very great deal at stake. This province is probably Alberta's best customer for the majority of her products. In our business we purchase enormous quantities of hay, oats, flour, beef, mutton, pork, horses, butter, eggs, etc., from Alberta, and if our industry is to be impaired, owing to our natural market being sacrificed to the Americans, our purchasing power for these products will be materially lessened.

I note that the Western provinces of Alberta, Saskatchewan and Manitoba imported about 70 million feet of American lumber during 1910; thus over one million dollars of Canadian money was taken out of this country which should have gone to build up and assist home industry. I do not believe that the consumer receives any advantage whatever from the cheap lumber which is dumped into this country from the United States, for the results of my observation and an intimate knowledge of the North-West market for the last ten years, convince me that the retail price of lumber on the prairie is based upon the wholesale price of the Canadian mills.

Yours faithfully,
W. A. ANSTIE, Sec-Treas.

The Quebec Pulpwood Controversy

Difference of Opinions Regarding Available Resources—Interesting Letter from a Prominent Quebec Lumberman

The reports which were recently made by United States Consul Gebhard Willrich, of Quebec, regarding the quantity of growing pulpwood which is available for export in the Province of Quebec, have attracted widespread attention. In a recent issue of the "Canada Lumberman," a letter was published from Mr. O. E. Elsemore, of Toronto, a man who has had much experience as a timber cruiser in the Province of Quebec. Mr. Elsemore put his side of the case pretty strongly and presented figures to show that Mr. Willrich was greatly in error in his estimate of the quantity of pulpwood growing on private lands in the Province of Quebec.

That there is room for an honest difference of opinion upon the subject, is indicated by letters which the "Canada Lumberman" has received from other sources. We take pleasure in publishing herewith a letter from a resident of Quebec who has exceptional facilities for securing an intimate knowledge of the situation. He takes Mr. Elsemore strongly to task and his letter should be read carefully by all who are interested in the cantroversy which has developed upon this subject. After referring to his reason for replying to Mr. Elsemore, the writer continues as follows:

I have no brief for Consul Willrich, nor have I ever seen any report made by him, though I have seen allusions to it made in various papers.

Mr. Elsemore appears to assume that three million acres owned by farmers and homesteaders in the province is the total of lands granted in this category by the Government and consequently includes all portions of these lands which may be under cultivation.

By referring to the returns made by the Provincial Government Mr. Elsemore will find that from the 1st May, 1867, to the 30th June, 1909, the Government granted 6.863,035 acres, and if we add the sales made from the latter date until the 1st September, 1910 (which figures are not yet published), this date being the one upon which the regulations came in prohibiting the export of pulpwood from located lands, we arrive at a grand total of more than seven million acres. Of this amount, say, 1,660,000 acres must be deducted for lands which have reverted to the Crown, leaving a net area of 5,340,000 acres, and these grants were made, not in a period of 50 to 100 years before the passing of the Act, but in a period of 43 years in all.

The area of these lands which have been entirely denuded of wood I do not think will exceed 2,340,000 acres, which it is necessary to deduct in order to arrive at the three million acres of standing timber.

In regard to seigneurial lands, the total area of the seigneuries in the Province of Quebec amounts to 10,816,000 acres, and after deducting the lands out of this area taken for villages, farms, etc., the amount given of 2,000,000 acres as being still in forest, would be a very conservative estimate, in my opinion.

In addition to the above, there are 647,643 acres of railway grants in the Province of Quebec, which are also exempt from the prohibition clause; so much for the amount of land which still remains in standing timber in the province, which is the property of private parties.

Now as regards the average amount of wood per acre on these lands made by Mr. Elsemore (viz., not more than one cord of spruce pulpwood), this statement is too ridiculous to call for comment, and you have very appropriately placed it alongside of your advertisement denoting "a broad smiles," which leads me to think that you probably did not intend your editorial, as regards Mr. Elsemore's letter, to be taken seriously.

In conclusion, Mr. Elsemore will only have to look at a map of the Province of Quebec, showing where the located lands have been granted, to know that they are, generally speaking, the most accessible lands in the province, and the same might be said of the seigneurial lands still in standing timber, and therefore Mr. Elsemore's estimate that 90 per cent. of these lands are inaccessible is irresistibly humorous.

As an item of information, I may state that in addition to the lands above mentioned as being exempt from the prohibition clause, there is the Island of Anticosti, which has an estimated area in standing timber of about 800,000 acres, and also railway grants amounting to 647,000 acres.

Important Saving in Shingle Making

Editor CANADA LUMBERMAN.

The "Shingle Business" has been sick a long time, and there are so many "quacks" and "habties orders" feeling its pulse, and looking at its tongue, that there is danger of its being worried to death, if it does not get the proper prescription soon. I wish to place before interested manufacturers of lumber and shingles a few important facts regarding economy in manufacturing, and will confine my suggestions to the manufacture of shingles, and especially the "shingle saw."

In sawing shingles, the first point to notice, is the kerf that is taken out between each quarter of an inch of wood. In the average block there are sixty shingles and consequently sixty kerfs. Now suppose we are using the Dunbar shingle machine; fitted with 1 11/32 spurs, which are rolled by ratchet-wheels having 12 teeth, thereby making 12 shingles in each revolution; and 17-gauge saws (this being the general arrangement in the better class of mills). Suppose also that the 12 teeth ratchets, putting on others having 14 teeth which will give 14 shingles instead of 12.

Immediately, we find that the shingles thus sawn are four courses too thin in the bunches, and, therefore, useless. Now we thin down the saws to 22-gauge and run them in 20-gauge kerf instead of 14-gauge kerf, and we have shingles exactly the thickness for the Boston market. But I am aware that saw companies do not guarantee these saws thinner than 18-gauge, and even these are often unmanageble. I must say, however, that I have no difficulty in getting perfect work from 22-gauge and even 23-gauge saws, with these new principles. I am, and have been for years, running 20-gauge saws with Dunbar 1 11/32 spurs, on which I have put ratchets having 14 teeth, and by making these changes the firm I am with are getting the highest Boston market prices for their shingles. Moreover, we have no loss, such as shims, nor any variation of saws from a true line in the work. The work is perfect beyond a doubt; and we are gaining a million shingles in every six million shingles cut.

Let me ask manufacturers if they had a man working in their mill of say ten machines, who brought them each day, a raft of sufficient logs to cut 20 thousand shingles, and did his day's work besides. According to the cost of cedar to-day, could they not afford to pay that man $20 a day?

Well, the filer who can get two shingles from the sawdust of the 12 shingles rolled out by each revolution of your spurs, is putting in your possession much more than the equivalent of the little raft; for he gets it from the sawdust that you are paying men to burn up every day, and he gets it hauled up, cut up, sapped, and put into the shingle machine, free.

In conclusion, I wish to ask manufacturers to figure out this "gain by small spurs." I shall be unwilling to vanquish all doubt as to the success of a principle, which I have perfected through long years of patient experimenting, and which at last it speaks for itself. These saws and the work they are doing every day may be seen at the shingle mill of Georges Berube & Son, Cabano, P.Q., or demonstrations might be made in any other mill. I shall cheerfully answer correspondence from interested parties on this subject. Yours truly,

J. E. MOIR.

Algonquin Park Enlarged

The Ontario Government has carried out its intention, recently announced of enlarging the boundaries of Algonquin Park. Those portions of the recently purchased timber limits extending over the original boundary of the park have, by an order in Council, been formally added to the park. The territory has an area of 132½ sq. miles, in the townships of Lawrence, Nightingale and Airey, and is part of the 380 square miles under lease to the Munn Lumber Company, taken over recently by the Government at a cost of nearly $300,000. The southern boundary of the park, with the new additions, now presents a somewhat irregular appearance. This is due to the fact that many years ago, before the district was laid out in townships, the timber limits under license were laid out parallel to the Ottawa River, their lines running southwest. When the new surveys were made and fifteen or more townships set aside for a national park, the township lines did not conform to those of the timber limits.

VIEW AND INTERVIEW

Various Opinions on Lumber Affairs

More Confidence Needed

"If people would stop reading daily newspapers on financial and business subjects and proceed with the confidence that the situation really warrants," says Luther P. Graves, of Buffalo, "there would soon be little reason for complaint." Mr. Graves declared that he was so sick and tired of the hunt people were making after something to be afraid of that he had little confidence in anything published on the subject nowadays. He added that he could see nothing to be afraid of anyhow, though he was willing to say that much of the apprehension came from the agitation in regard to trusts. He declared, however, that if something had not been done to break down the influence of the trusts the United States would soon be an oligarchy, controlled by a few rich men, and it was painfully close to it now. Mr. Graves, as the head of Graves, Bigwood & Company, is cutting a large amount of logs in his Canadian woods this winter, mostly white pine, and reports that the cut will be very satisfactory, especially as to quality.

Says Pulpwood is Plentiful

That there will be plenty of pulpwood for the American manufacturers in spite of the restrictions lately imposed by the Provincial Government, providing the Americans are willing to pay for it, is the opinion Mr. Carl Riordon, managing director of the Riordon Paper Company, Montreal, expressed in a recent interview. The supply of pulpwood in the United States, he said, was rapidly decreasing and the demand increasing. Americans would be compelled to take Canadian pulpwood at whatever price was asked. As to the complaint of the paper committee of the American Newspaper Association that it would be impossible for them to get one million cords of pulpwood from Quebec annually, Mr. Riordon said that there were at present one million cords ready for the market. During the past three years the demand for pulpwood had been small. The wood had consequently accumulated. As wood was so plentiful at present Mr. Riordon looked for a decrease of 150,000 cords in the amount of wood cut from timber limits. Late next year there would be a further decrease of 150,000 cords cut from settlers' lands. In the near future Mr. Riordon believed that prices would soar in the United States and Canada due to the scarcity of pulpwood in the United States.

B. C. Timber a Fine Investment

"I regard prudent investments in British Columbia timber as unsurpassed by any other form of investment. At today's prices it is a better buy than it was three years ago, now that the question of tenure of title has been decided," says Mr. M. J. Scanlan, of Minneapolis, president of the American Timber Holding Company, an American corporation with a capital of $6,000,000. Mr. Scanlan is a partner of the well-known sawmill firm of Brooke, Scanlan & Company, owning plants and timber limits in the Bahamas, the Southern and Northwestern States and British Columbia. He is also president of the Powell River Paper Company, which is erecting a large paper mill at Powell River, 75 miles north of this city

"During the past year our timber holding company bought two billion feet of British Columbia timber, bringing up our total holdings in this province to about five billion feet," continued Mr. Scanlan. "Our purchases represent an investment in British Columbia of about $2,500,000. The principal holdings are olcated on the Fraser River, Jordon River and Quatsino Sound, Powell Lake and the Narrows Arm district. It is not our intention to sell one single stick of timber at present. We are quite content to hold it for its value is increasing daily."

Mr. Scanlan is also one of the principal shareholders in a company which is logging thirty million feet annually in two different places, on Harrison Lake and at Gordon Pasha Lake.

Forestry Recommendations Approved

"Generally speaking the recommendations of the B. C. forestry commission as indicated in the published draft will be very satisfactory to the lumbermen of this district," said W. A. Anstie, secretary of the Mountain Lumber Manufacturers' Association recently, in reference to the report of the commission consisting of Fred J. Fulton, K.C., A. C. Flumerfelt and A. S. Goodeve, M.P., which has just been made public.

"That this would be the case was only to be expected when one considers the personnel of the commission," Mr. Anstie continued. "I think that the suggestion regarding the creation of a department of forests is one of the most vital points of the report. Such a step could hardly fail to be productive of results to the benefit of both the lumbermen and the province as a whole.

"As to the recommendations concerning the fighting of forest fires and their prevention, I think that they will meet with the approval of both the lumber operators and the owners of timber limits.

"Another important section of the recommendations of the commission is that relating to the public sale of fractional limits adjoining timber areas held by operators. The suggestion that such fractions should be sold by public competition is one which I believe will, if adopted, prove entirely satisfactory. Under the existing legislation there is no means by which a lumberman may obtain such fractions and the timber frequently goes to waste. If these fractions can be obtained by lumbermen who are operating on adjacent limits the timber could be economically cut and manufactured into lumber.

"On the whole the report is a very businesslike one and cannot but result beneficially," he concluded.

Mr. Anstie returned recently from a visit to East Kootenay. Logging operations in that district, he said, were in full swing and the lumbermen were preparing for an output next spring equal to that of the past year.

Why Quebec's Output Decreased

The Statistics which were published in the Canada Lumberman of Dec. 1, regarding the production of lumber in Canada for the year 1909 contained much that was of importance to those engaged in the lumber trade throughout the country. One of the most important facts brought out was the decline in the production of lumber in the province of Quebec. Although the cut for the whole of Canada increased by 22 per cent., the cut in the province of Quebec decreased by 7.7 per cent.

A prominent lumberman of Montreal referring to the matter gave the following explanation of the decrease:—

"The decrease in the cut is simply a question of market. We cannot get the prices we want for either white-pine or spruce in the English market, and the market not being good enough there is no use in increasing our cut. Norway, Sweden and Russia are knocking the bottom out of us with regard to the supply to England of this description of lumber. We cannot compete with these countries, for the labor is in some instances one-third cheaper than here and in regard to the cost of transport, particularly in the cases of Norway and Sweden, we are altogether put out of court.

"Riga, in Russia, is our worst competitor, where spruce is concerned. Then again, there is the present system of shipping to England during the winter, which frequently entails a loss. If this winter shipment was dropped and the old practice of only shipping in the summer was reverted to things would be better for the lumber trade of Canada, Quebec in particular. To-day's market report says that in liner-shipments (meaning the winter shipments) values are easier. This is not at all good news to us, for it means a dropping of profit to us, and corroborates what I have just said.

"The stocks, too, of Quebec white-pine, yellow deals and spruce on the Liverpool and Manchester markets remains about stationary, as you can see from these market reports just to hand. Such being the case, and with the foreign European competition, etc., there is no inducement for us to increase our cut; if anything, at the present moment, the tendency should rather be in the opposite direction.

"We have really a capacity for an annual cut of 35,000,000 feet, but we have not cut over 15,000,000 feet this year. This year there was only a total shipment of two hundred standards of spruce, not worth mentioning. The United States we found our best buyers this year, and if it wasn't for their southern lumber district we should have a good deal better market with them. Things will no doubt adjust themselves, and find their level bye-and-bye, but as things are now there is no use in cutting timber for which there is no market."

More Forest Reserves Probable

Hon. Clifford Sifton, Chief of the Conservation Commission, was the guest of the Canadian Club of Ottawa at luncheon recently, and made the announcement that at the present session of Parliament the commission would ask the Government to introduce legislation making railway companies liable to a penalty for every fire spreading from their right of way.

"We are trying to get the Government of the country to establish a greater number and a larger area of forest reserves," declared Mr. Sifton. "Algonquin Park is to be considerably, enlarged, and will hereafter be much more useful to the public of Ontario. In the western portion of Canada we have succeeded in getting the Dominion Government by Order-in-Council to set aside a great stretch of territory on the east slope of the Rocky Mountains. We are assured by the Government that they intend to bring in legislation this session constituting that stretch of territory a forest reserve and a forest park. This is 500 miles long and from 3 to 1,000 miles in breadth, and has an area of 14,600 square miles, or considerably larger than that of Belgium.

"The eastern slope of the Rocky Mountains is the reservoir for the waters that flow across the prairie provinces of Saskatchewan and Alberta. Upon the maintenance of that forest depends the fertility of those provinces. And as surely as we are here to-day unless proper steps are taken to prevent it these forests will be burned. Every foot of timber will be taken off by forest fires.

Last year, we had fires. We have left out of account the little fires, and have taken only those that may be regarded as serious. We have the figures covering Ontario, the Dominion lands in Manitoba, Alberta and Saskatchewan, and British Columbia; the figures for Quebec and the eastern provinces are yet to come. And we find that there were 2,019 fires doing serious damage. Of these, the railway caused 489; unknown causes, 511; the remainder were caused by campers, prospectors and others. Of those fires the cause of which was known, the railway locomotive was responsible for 32½ per cent.—and probably of 32½ per cent. of the unknown as well.

"There is only one way to deal with the question effectively, and that is to make the railway company liable to a penalty for every fire that spreads from its right of way. They can prevent them, and if they are liable to a penalty in such cases they will do it, for no institution adapts itself more quickly to a statutory requirement than does a railway company."

Personal News of Interest to Lumbermen

Mr. Andrew Freeman, of Winnipeg, has been appointed Dominion Crown Timber Agent, succeeding Mr. Stephenson made Inspector of Agencies. Mr. A. F. Crows, assistant Crown Timber Agent, is transferred to the Forestry branch at Ottawa.

Mr. D. C. Cameron, the well known lumberman of Winnipeg and president of the Rat Portage Lumber Company, who is an ex-member of the Ontario Legislature for Rat Portage, will, it is reported, succeed Sir Daniel McMillan as Lieutenant-Governor of the Province of Manitoba. Mr. Cameron is well known from one end of Canada to the other.

Mr. A. E. Gordon, formerly with the Ontario Lumber Company, of Toronto and French River, has joined forces with Muir, Terry and Gordon. The offices of the company which were formerly in room 408 of the Confederation Life Building, Toronto, have now been moved to rooms 203 and 204 of the same building.

Mr. Percy Dunn, who has been Orillia manager of the Standard Lumber Co., Langford Mills, was recently made the recipient of a handsome gold watch, bearing the following inscription: "Presented to Mr. Percy Dunn after 22 years of faithful service at Longford Mills, by the Standard Lumber and Stone Company. December 1st, 1910." Mr. Dunn is severing his connection with the company to go to Port Arthur, where he and his brother have purchased a hardware business.

Mr. Thomas Patterson, Vicegerent Snark of the Concatenated Order of Hoo-Hoo, for Eastern Canada, whose services in that honorable position during the past year have resulted in a considerable increase in the interest taken in the work of the order, has been asked to continue in the office for another year. He has decided to accept the office for a second period and will no doubt succeed in stimulating even greater interest among the members. He has in mind at present a proposal to hold the next concatenation at Ottawa. Such a move would probably result in a large increase in the membership, and would meet with the approval of the members who live in the eastern part of Ontario. If a concatenation were to be held during the time of the annual meeting of the Canadian Lumbermen's Association, which is to take place early in February, a large number of manufacturers and wholesalers would be present and would be able to assist in creating enthusiasm.

Montreal Lumber Association Officers

The annual general meeting of the Montreal Lumber Association of the Board of Trade was held recently and the following officers were elected: President. W. K. Grafftey; Vice-President, Geo. A. Scott; Treasurer, F. W. Cotter; Executive Committee, W. A. Filion, G. W. Grier, D. H. MacLennan, J. H. Redfern. Mr. Grafftey was unanimously chosen as the association's nominee for election to the Council of the Board of Trade. The annual report for the year 1910 was presented by the retiring President, Mr. Alexander MacLaurin, and was unanimously adopted.

The newly-elected President, Mr. W. K. Grafftey, is a lumberman of long experience. He was born in England in 1849, and his parents came to Canada in 1856. They settled in Owen Sound, where Mr. Grafftey obtained his education and his early business training. After being engaged for a number of years in the hardwood business, he took charge of the business of G. A. Grier, lumber merchant, of Montreal, with whom he remained for 20 years. In 1897 the Montreal Lumber Company, Limited, was formed, and Mr. Grafftey became its managing director. He has devoted his attention largely to the handling of Ottawa Valley pine, although he has had experience in every other branch of the trade. Success attended the company from its formation and it soon became an important factor in the Ottawa Valley trade.

THE WOODWORKER

Electric Driving of Wood-working Machinery

In our last issue we referred to the unfamiliarity of some electrical engineers with the difficulties to be contended with in the electric driving of wood-working machinery, as well as various other points of interest.

In addition to the great advantage of intermittent working secured by the use of a direct electric drive in saw mills, an additional one is that the horse power used at any given time can be readily observed by means of a meter connected to the supply circuit, thereby indicating if the machine is taking too much current to drve. By this means any inefficiency in a machine can be promptly found out and rectified.

The following are the chief advantages in an individual motor drive: —(1) Economy in current consumption, which has to be paid for; (2) dispensing with countershafts and unnecessary belting and pulleys, and consequent economy in space; (3) minimises noise; (4) steadiness in running; (5) less liability of breakdowns; (6) constant speed; (7) the amount of current used is strictly according to the requirements of the machine at a given moment.

With regard to the location of each individual motor, this is governed largely by exigencies of space and type of machine to be driven, etc.

For most machines the motors are of the usual horizontal type, but in some special cases vertical motors are used.

As regards the putting down of an alternating current or direct current motor, the consumer naturally has to be governed by the nature of the local supply, should current not be generated on the premises. On the other hand, should the consumer decide to generate his own current, a direct-connected alternator, with direct-coupled motors on to the various machines (as far as possible) will be found an economical method for power users.

The most usual form of an alternating current motor for saw mills is the three-phase induction or squirrel-cage and other types, and two-phase are also used. The single-phase motor is not employed to such a large extent, and labours under the disadvantage of being unable to start on full load, without the use of special phase splitting or other devices for starting purposes.

A large proportion of the wood-working machinery in Great Britain is driven by the ordinary direct-current shunt-wound motor.

High speeded motors are most generally employed (and geared down where required) for specially constructed slow-speed motors obviously cost more, as they necessitate a special form of winding on extra large castings in order to increase the torque to make up for decreased velocity.

The cost of a 10-h.p. motor of 1,200 revs. per minute would be approximately the same as a 5-h.p. running at 560 revs. per minute.

As regards the use of motors in saw mills, some machines can be driven equally well by either direct or alternating motors. The chief advantages in an alternating current motor are (1) no commutator, with its attendant troubles; (2) being able to take a heavy overload. The points in favour of the direct current motor are (1) securing a variable speed motor; (2) air gap wider, thereby allowing of greater wear in the bearings before the motor is overhauled.

One of the most useful and handy purposes an electric motor can be used for in a saw mill is the direct driving of suction fans in pneumatic systems of trunking for the removal of sawdust and shavings, etc., from the machines. The motor is usually built up on the fan spindle, thus making a compact and workmanlike job.

Electric power can often be used to great advantage in a saw mill yard, notably with cranes and log cross-cutting saws, where the duty is intermittent. With regard to crane driving, although the first cost is somewhat higher than a single motor and gearing, we can recommend the system of employing three motors, viz., one for lifting, one for slewing, and one for travelling, as this arrangement is both rapid and effective. Should there be a wharf crane or Scotch derrick for unloading purposes it could also be electrically driven with advantage. Motors for crane driving are series wound, as this type possesses the advantage of a large starting torque, as a considerable initial effort is required in lifting heavy weights.

For cross-cutting logs as they lie in the yard, a good plan is to arrange a portable saw with motor and cable attached, as it can be easily moved from place to place.

In driving four-cutter planing and moulding machines, the motor is usually coupled direct to the machine's main countershaft, which as a rule runs at a suitable speed.

In the case of a pendulum cross-cut saw, where one is desirous of securing a longer belt drive, a heavy wooden frame can be consructed on the floor above, and the motor mounted on same, holes being cut in the flooring for the passage of the belting to the countershaft.

One of the latest applications of the electric drive in wood-working machinery is the portable roller sandpapering machine. This is especially adapted for skating rinks, as a large surface of flooring has to be operated on, and no other kind of drive would meet this particular case so well. The machine and its motor are mounted on wheels and thus make a very compact and efficient tool, and by using a flexible conductor can be operated in any desired position.

In the case of group and belt driving a safe and convenient plan is to place the motors in concrete-lined pits in the basement if the site will permit of it. —The Timber Trades Journal.

To be continued.

Who Pays for Loss by Accident?

There may be a few institutions in which all errors and accidents which spoil work are charged up directly to the men making them, but in the average woodworking plant it would raise a storm of protest if the management should tack up a notice saying that every man making an error or having an accident would have to pay for it.

Still, in every well-regulated institution the men doing the work do indirectly pay for all errors and accidents and all damage, both to material, machines and themselves. The management, if properly conducting the institution, must get a profit out of the business, as well as an income from the investment, and the amount it can pay for the work is in some measure regulated by the expense of getting out the work as related to the final selling price; therefore, everything that adds to or takes from the expense of getting out the work affects in some measure the amount that can be paid to the men doing the work.

It makes a difference, of course, whether it is taken directly out of a man's wages or is figured into the general scheme of cost, but just the same the men doing the work actually pay for these things. This should serve to make everybody more careful and less inclined to waste good material—sometimes to cover up an error.

If you make an error in cutting out something, you may think that you are saving your skin by chopping up the piece of timber into small bits and throwing it into the scrap-pile, when it could well be worked into something else, but you are not. You are escaping personal censure, but you are adding to the general expense, and, in a way, taking from what the management is able to pay its men.

Every accident that costs a man his life or limb is partly paid for by the men that work, because it must be figured in the cost of factory operations, and generally some insurance carried against it. It is the same way when a machine is broken, and it is the same thing when you make incidental errors in the work during the day.

The right way to consider those things is that we all pay for them indirectly, just as we all pay the taxes and expenses of the government, without knowing it; and when we come to realize fully that we are paying for accidents and errors, we shall not only be more careful, but when an error is made we shall not add to it that other mistake of wasting good material simply to cover up the error.—The Woodworker.

The Cooperage Cloud—A Silver Lining

The slack cooper was discussing conditions in the trade.

"Well," he said, "the holiday spirit is in the air; so I believe I'll just take a look at the silver lining in this cooperage cloud. Some of us have been looking only at the outside of that cloud. I believe, but as far as I am concerned the silver in it assays pretty well.

Here's the proposition of competition. Well, they say that in some lines of business competition is the life of trade, but it came near being the death of mine. The other fellow wanted the business so bad that he nearly broke the market to pieces trying to get it, so that we slashed pretty nearly all the profit out of the business holding on to what we kept, and he didn't make anything out of what he took away from us.

"That's a fine way to do business, is it not? Yes, it is, not. The only thing that we could do after a few months of that sort of cat-and-dog business was to buy the other man out. Let me tell you, he was glad to be bought out, for he had nothing but glory to show for his efforts during the past few months.

"Prices haven't got back to where they ought to be, yet, as the result of that sort of competition. The consumers who get in the habit of paying a low price, even if it is one that doesn't contain a half-cent of profit for the cooper, hold on to it like the mischief, and they think they are getting robbed if you tack up the old schedule again. But we're gradually getting it up, and maybe, by next Christmas, we'll be on Easy street again—provided some other kind-hearted man doesn't break into the cooperage game and try to make a few presents to the barrel consumers.

Flour barrels? Yes, they're using a few of them, in spite of the fact that the paper sack has been trying to boost itself into universal popularity. You know, of course, that the paper package is about as unsanitary as anything could be, especially when you consider the fact that the freight cars that carry it from the mill to the jobber to the retailer are frequently not in the best of condition. Yet, just to make that weak point strong, some of the flour men who cater to the small consumer are advertising their cheap little paper sacks as 'even-priced sanitary packages.' That would make you laugh—if it didn't make you weep.

"The government is going to take a hand in the game one of these days, though, and insist that flour which is shipped in freight cars and exposed to the weather in handling shall be packed in wood. The public would demand it if it realized conditions, and the retailer would demand it if he thought he could get it, because you never saw a grocer who wouldn't prefer to handle a barrel of flour rather than the same volume in paper sacks.

Discontinue Second Hand.

"No, we've quit monkeying with the second-hand barrel trade, although that used to have a pretty profitable angle of the business. I knew one cooper who made more money out of his used barrels than he did out of the ones he made. In former years you could send a man out to buy barrels from consumers, and they could be had for five or ten cents. There was a chance to turn them over, then, at a fair profit.

"That has changed, though, because in later years the man who owns a waggon that used to be good and isn't, and a poor old plug that has seen better days, has come to the fore. He drives his outfit through town and is willing to trade as long as he can make a day's wages out of it. He has boosted the market price of second-hand barrels to fifteen cents or so, and, of course, there isn't any money in the business any longer for the legitimate dealer.

"We do sell some used barrels, though, and find them a rather easy item to dispose of. Consumers of sugar in this town are rather numerous, including, for instance, the vinegar manufacturers. They can't use the barrels a second time, and we contract for the entire quantity they get. We sell them again for use in packing bottled whisky or, frequently, for coffee.

"The coffee roasters ship their product out in bulk to the retailer in many instances, as the demand for branded coffee is not yet sufficient to break heavily into the trade in bulk goods. The sugar barrel, which is a first-class package of the slack variety, suits coffee handling excellently, enabling it to retain its excellent aroma and being a convenient form for the handler of the commodit.

"That man who just came in wanted a few cracker barrels for a biscuit company. We sell a good many of them, but not as many as we would like. As a matter of fact, we have received grapevine information to the effect that the policy of the biscuit company is to reduce the number of barrels it is using as much as possible, and to substitute, wherever it is possible, the fancy boxes which it uses so largely. This is a hint to our friends in the other department of the wooden package industry to get busy.

"You might think from what I've said that I am getting ready, because of the falling off in the demand in a few lines, for a trip over the hills to the poorhouse, or something of the sort. But don't you believe it. I'm getting along pretty well in this little old game, and I like it better all the time. The United States is a great big country and the people in it number close to 91,000,000, unless the war correspondents at Washington are mistaken in their forecasts; and 91,000,000 people, eating food and wearing clothes and living in houses, consume a whole lot of things, and a good many of them, praise be, are packed in barrels.

"And as long as this is a fact, the consumption of barrels is going to continue to increase, and with a little aggressive work on our part in going after new lines and developing new uses for the barrel, the increase in the volume of our business is going to surprise even the optimists in it—like me!"—Barrel and Box.

Sawyer's Figuring

Bill Sawyer, for 15 years proprietor of the Sawyer Heading Mill, sat on a pile of bolts in the mill shed contemplating the inactive saws, steam boxes, planers, etc. The air was cool and bracing and it was one of those mornings that make a man feel that he is glad to be alive. Bill Sawyer felt this exuberation of his surroundings, but the absence of the buzz of the saw put a damper on the situation. This warmed verbal reflection on the situation.

"I reckon," he said to himself, "that I ain't been keepin' pace with the situation in the heading business and the derned business ain't what it uster be. And I'll be blamed if I can see the reason why. She is a good enough mill, as good as any of 'em, and there ain't no trouble about gettin' the timber. There just naturally ain't no life to the thing, and that's all there is to it.

"The thing looks kinder queer. Anyhow you figure, I can buy my bolts as cheap as any of 'em, except when that lummix up the river hists up the price and I have to go back at him and show him I'm as smart and have got just as much money as he has. And I know I kin make heading as cheap as the others. Accordin' to the way they talk at the association meetin's and the letters they write to the papers, I can beat the big mills all holler on cost.

"I s'pose to be exact I might figure in something for my work, but I've got to put in my time anyway, and it's the same way with Tommy when he works after school. It don't seem reasonable to do that when, if we didn't work at the mill, we'd have to be doin' something else. Besides it's my mill and it certainly would be foolish for me to pay myself for workin' for myself, and Tommy for workin' for his dad who has to buy his clothes and keep him in school anyway.

"It's the same way about chargin' insurance, taxes and repairs an' all, and chargin' interest. The whole gol derned thing is mine and has got to be kept, and I ain't goin' to gouge the business like a trust for salaries and so on and not give it a show to make a little money. That last sale I made was on the basis of 6½ cents per set delivered and it looked like a clean profit in it for me as I figured it out, but, by gosh, I can't see where the money went.

"If I could get a little more trade I might be able to make a better profit, but competition is pretty strong with all the big mills advertisin' and goin' after the business. Takin' quarter pages in the trade paper costs money and a mill like this can't afford to buy even an inch or two without robbin' the family of food and clothes.

"Now I've got to find out what the trouble is. This mill simply don't make a profit even when I can buy the bolts as cheap and my manufacturin' cost is below the other fellows'. I've got everything a mill ought to have and have the sellin' down to a science. I've got everything in fact, except a profit in the business. I've got to check up on the business somewhere, but I don't know where to begin."

Bill Sawyer got up, dusted himself off a little, and started for the house with his mind made up to keep his mill shut down until he could find the trouble if he had to wait until the next association meeting. Just before Sawyer reached the house, he turned and looked at the yards where several thousand sets of heading were piled, and said: "No order will move that heading until I can see a good profit in the sale on a different basis of figurin'."

Past Experiences

I was called to file a single band mill that had used seventeen new saws in six months, day run only, saying nothing about the cull lumber that was cut, says a correspondent of The Wood-Worker. The filer who was there was an experienced man, but he did not believe in a long back. I lined the mill up and found it right, but on examining the pulleys found they had been ground off with a stone and the faces were very uneven, so much so that a straightedge would rock on them. I explained the matter to the manager and asked to turn them off with a tool; he said the mill would only run a month longer and then they would be down for repairs.

I went into the filing room, put a saw on the bench and found the tension fairly good, and a straight back. I rolled the back out 1/32 inch in 5 feet and put in all the tension I could from edge to edge and yet have the saw lie of its own weight on the bench. I also put in more hook—9½-in. to 12-in. blade. After finishing the saw I put it on the mill, and if ever you saw a pleased man it was the sawyer; he commenced to drop off twelve boards a minute, 16 feet long and 12 inches wide, of smooth, even lumber.

In sawing frozen timber with a band, a slow speed, not exceeding 8.000 feet a minute, is necessary, swage not to exceed four guages of set. Carry all the hook you can and yet have a strong tooth. Put the tension in from edge to edge, or in a circle, having the blades level and 1/32 inch in 5 feet long on back. Be sure not to get saws hammered into the log. It is better to finish the inside of the saw, for nearly all saws are inclined to run in on frozen lumber.

If these instructions are carried out, I will guarantee saws will run nicely in frozen timber, providing the band mill is in first-class condition, which is very essential at all times. In regard to strain, I am of the opinion that there are more saws cracked from too little strain than from too much. I am in favor of carrying 8.000 lbs. on 12-in. blade. The greater the tension in saws, the more strain is required.

Application was made recently at Fredericton, N.B., for a winding up order in the matter of the Miramichi Pulp and Paper Co., Ltd., on the petition of the J. B. Snowball Co., Ltd. Judge Barry granted the application and appointing W. B. Snowball, of Chatham, N.B., provisional liquidator. The application was made to enable the unsecured creditors to obtain a share of the benefits of the estate. Mr. Snowball's authority as receiver will by this order of Judge Barry supersede that of William J. Dick, the receiver appointed recently, and on Friday, Jan. 6, a further application will be made for the appointment of a permanent liquidator for the estate.

The Retail Dealer and His Problems

The Credit Man's Responsibilities –The Farmer's Trade

The Credit Man and the Retailer

The relation between the retail lumber dealer and the credit department of his wholesaler or the mill are often misunderstood owing to a wrong impression on the part of some dealers that the credit man of the manufacturer (often the local agent) is his natural enemy, and ordained by Providence and employed to turn down orders, and embarrass him with senseless inquiries regarding his financial affairs. In reality, there is no department with which the retailer should be on closer terms than the credit department of the mill or its representative.

In many cases, the credit man is a member of the company and as anxious to increase its trade as the retailer himself to add good customers to his own list. As their interests are mutual, the credit man, owing to the knowledge naturally acquired from experience of his customers in various parts of the coast, is often in a position to offer suggestions or advice on bookkeeping methods, special sales, advertising, private investments, etc., besides recommending to other wholesalers certain retailers as deserving of credit. Credit men are constantly exchanging trade experience with each other and the retailer standing high with his credit man will be favorably mentioned to others. In soliciting trade, salesmen naturally offer their desirable stock sheets to the best credit risks, therefore, the retailer should cultivate as friendly relations with his credit man as at home with his local banker from whom he desires accommodations.

As to the retailer who has no established rating objecting to a credit department's investigation of his financial condition before extension of credit, a second thought should convince him that if he loans money or sells on credit to absolute strangers without some knowledge of their affairs, he is a very poor business man and sooner or later will accumulate a worthless lot of book accounts difficult to realize upon. His local banks, in loaning money, would either require security or an endorser, unless they had some definite knowledge of his responsibility, and, consequently, in expecting favors from a distance he should furnish some basis for such accommodations, as the mill's profits are now so small the question of credit must be elimianted as far as possible. On the other hand, a dealer cannot afford to buy of a mill where credits are extended carelessly, as such unbusinesslike methods simply result in a heavy percentage of losses which must be considered in the price or grade which the retailer will eventually pay; in other wards, the conservative, prompt-paying retailer does not care to pay for the bad debts of other men, and should patronize the jobber or manufacturer whose losses are light.

Mistakes are often made by retailers in refusing to give to credit men or commercial agencies information about their affairs, for a poor agency rating compels a jobber to hold orders for thorough investigation, causing delay in shipment and other annoyances. The poor rating may be inspired by trade jealousy or the reports may emanate from a personal enemy, conditions of which the agency has no knowledge, but the refusal of a retailer "to show his hand" will naturally confirm such unfavorable reports; the responsible buyer, therefore, has everything to gain and nothing to lose by having his affairs clearly outlined; otherwise it is an indication that he dares not have the actual facts disclosed, while frankly explaining conditions to his credit man would result in straightening out matters with agencies, thus giving the merchants such ratings as he may be entitled to. Many dealers claim they "want no credit," but "pay cash," which technically is "cash with order," for, if goods are shipped on ten or thirty day terms, it is a credit extension if possession is given before payment is made.

Many retailers and salesmen seem to consider that when credit is refused the customer's honesty is questioned. This is entirely wrong, for, although honesty and character are the foundation stones of business success, other elements are essential. Statistics compiled from several years' records show that of business failures, 30 to 35 per cent. in the United States are caused by the lack of capital, 20 to 25 per cent. from incompetence, while inexperience, unwise credits, extravagance, neglect, competition, speculation and disasters, together cause about 30 to 40 per cent., and dishonesty and fraud only 8 to 10 per cent. In Canada, from 1902 to 1905, 70 per cent. of the failures were caused by lack of capital and 15 to 20 per cent. by inexperience and poor judgment, clearly indicating that the credit man has many elements to consider besides that of honesty alone; crop failures, fires, suspension of work in manufacturing and mining districts, to say nothing of mismanagement, have seriously embarrassed, if not ruined, many honest merchants in spite of their best intentions.

In extending credit over large territories the credit man must keep in close touch with physical conditions that seriously affect the paying ability of his customers. He must watch the gold and silver mining output, as well as the manufactured ore products, the output of which is frequently interrupted by strikes and labor troubles at smelters, rolling mills and furnaces, causing serious injury to the trade and collections of our customers. The wheat, corn, tobacco and fruit crops in various sections must be kept in mind, and also the wool and live stock markets, and tendency of local producers to carry their products several months before marketing, which compels the retailer of lumber products to carry his accounts accordingly.

The activity of every factory and manufacturing town over the entire country and steady employmetn of labor at good wages, or its reverse, at points where customers are located, must be constantly in the mind of the credit man. It is often the patience, and confidence of the credit man in the honesty and ability of customers with whom he feels well acquainted, that keeps them on their feet in times of financial panics, while distrust or suspicion, arising from unwillingness of a merchant to frankly outline his condition, or give his friends an opportunity to assist him, will often result in disastrous failure. The statement that the credit men of mills or wholesalers are always anxious to close out and ruin a retail dealer is too absurd to consider, as their interests are mutual and the former's success is based on his customer's prosperity; and as the best part of any firm's capital is the good will of its customers, it would be folly to forfeit their esteem and friendship by unfair treatment.—The Pioneer Western Lumberman.

The Farmer as a Retail Customer

The country trade of the ordinary retail lumber yard varies with location. In the city it is small; in the large city almost nothing. In the country town it may represent all the way from 60 to 90 per cent. of the business. The retail lumber dealer may sometimes be inclined to think that the farmer trade is his chief cause of grief, yet it is possible that many a city yard man would be glad to swap his business for that of the country dealer. More than that, the business of the country dealer, even though smaller in volume, might show a larger net profit than that of his city brother. The city business is conducted at a larger overhead expense. It is possible, the city and country men being equally good collectors, that the loss on bad accounts is larger in the city than in the country.

The farmer is notoriously slow pay. His cash trade is small and he expects long time on his purchases, and without an interest charge. But there is this to be said in favor of the farm trade: Payment is reasonably sure. The farmer is not a fly-by-night member of the community. An occasional renter represents bad credit, but, as a rule, lumber bought by the farmers is bought by men who are living on lands of long tenure or even farms handed down from father to son. They are making permanent improvements in the community in which they expect to remain, and they are jealous of their reputations as debtors. They may be slow to pay but they pay ultimately if the retail manager's collection system is in any way effective.

The ordinary farmer, while he is a close figurer, demands quality first. He has some ideas concerning lumber—ideas, it is true, that are often out of date—but it will be observed that these ideas have chiefly to do with the quality of the stock. As to price, his chief desire is that he shall be able to buy as cheaply as his fellows. He does not resent the dealer taking a profit, but he does resent paying the dealer a larger profit than is secured from some other farmer or the town buyer.

Town trade runs largely to the patronage of the contractor and the house builder. These men, as a rule, know more about lumber and yet they are more interested in the question of price than in the matter of quality. The retailer who has a large contracting trade, unless he is constantly on his guard, will find that he is selling lumber at a pretty narrow margin of profit. The town trade often represents volume of business without a great amount of reward. Nothing is more deceptive than large figures, and a small barn bill at a proper profit may contribute more to the right side of the dealer's ledger than a big contract for which half a dozen dealers have been fighting.

Correction

Our attention has been called to a small but annoying error which appeared in the page advertisement of the Canadian Western Lumber Company in the November 15 issue of this journal. By the transposition of letters the word "no" appeared instead of "on," thus making the statement somewhat ambiguous. The many customers of the Canadian Western Lumber Company, however, would place the proper interpretation on the sentence, inasmuch as they know that it is easy for this company to make good on prompt shipments. They devote their entire time to the manufacture of good lumber, and then see that their customers are given quick service.

Lumber Matters in the Law Courts

Injury to Employee—Trespass Upon Timber Property Rights of Mining Lease Owners on Timber Limits

Injury to Employee.—In the Superior Court of Hull, Que., Judge Champagne has given judgment for $3,880 to plaintiff in the case of J. Trepannier v. the Haskell Lumber Company. The plaintiff sued for $9,000 damages, for injuries sustained through the defendant's alleged negligence, whilst he was employed in the capacity of a brakeman, on a yard train last fall at the Fassett mills. His Honor held that the defendants were guilty of negligence, in not seeing that the logs, which were loaded on the flat car, were piled evenly. The plaintiff had been caught between two of the logs while engaged in his duty of coupling the cars together.

Trespass Upon Timber Lands.—The case of the British America Mining Company, Ltd. v. the Pigeon River Lumber Co., of Ontario, and Fred. J. Smith, which was recently heard by Judge Sutherland, has been decided in favor of the plaintiffs. The plaintiffs asked for a declaration that there had been no sale of the lumber, logs and pulpwood involved, to Smith, and that consequently Smith did not and could not make any valid sale to the defendant company. They also asked for a declaration that the property in question still existed and was available, and that they were entitled to possession thereof. Judge Sutherland upheld these claims and found also that the defendant company should look to the Smiths for a return of $6,372 paid to the Smiths on account of their contract. It was further held that as the plaintiffs were recovering their property under circumstances of greater value they were not entitled to any substantial amount in respect of trespass. A counterclaim by Smith was set off against the damages claimed by the plaintiffs, and it was found that the improvements made by the defendants were of no substantial benefit to the plaintiffs. Judgment was for the plaintiffs for possession of the logs in question, and for costs of the action against both defendants.

Timber Licenses and Mining Leases.—In the case of Gordon v. Moose Mountain Company, which recently came before Hon. Sir John Boyd, the plaintiffs were licensees with power to cut all the red and white pine upon certain locations. The defendants claimed the same lands under Crown patents as mining lands. The defendants' patents were subject to reservation to the Crown of all pine, but the patentees had the right to cut such trees as were necessary for buildings, fencing, fuel, or for other purposes attendant to the work of the mines thereon. They could also dispose of all trees required to be removed in actually clearing the land for cultivation. The plaintiffs claimed that the defendants had exceeded their rights and they brought action to recover. The court held that the defendants had exceeded their rights, and directed a reference to the Master at Sudbury to ascertain what damages the plaintiffs had sustained. Further direction and costs were reserved.

E. N. Lewis, M.P., states that after the Christmas recess of Parliament he will introduce a resolution calling for the prohibition of the export of pulpwood from Canada. Last session Mr. Lewis introduced a motion calling for this prohibition to apply to any country that did not admit Canadian paper free of duty. This proposal did not reach the stage of a debate. Since then Mr. Lewis has concluded that a definite policy of prohibition is the better one to submit. The expansion of pulp mills and paper factories in Quebec leaves the settlers who formerly depended on American demand for their pulpwood independent of export trade. The policy of reserving raw products for home manufacture is consequently gaining strength rapidly.

The difficulty between the Powell River Pulp & Paper Co. and the Michigan-Puget Sound Lumber Co., which bought the Sayward limits in that district, has been amicably adjusted. The logging railway of the latter will be moved to another grade for the convenience of the paper company, which will bear the expense.

Japanese oak is making great inroads into the oak lumber and flooring trade in the United States Pacific coast. This situation has been brought about by the excessive freight rates demanded by the transcontinental lines for the movement of high grade oak lumber and oak flooring from the producing sections of the east and middle west to the coast. This duty of the railroads has made it possible to import Japanese oak of a satisfactory quality and at a much lower price than the eastern product can be purchased for. The crux of the matter is that the railroads have simply killed the goose that laid the golden egg, and have not only lost their opportunity for a profitable and substantial traffic in hardwood lumber from the east to the Pacific coast, but they have also destroyed quite a portion of the business of eastern manufacturers of hardwoods.

Price Paper Mills to be Complete in 1912

It is expected that the new paper mills of Price Brothers, Quebec, which are to be erected on the Riviere au Sable, at a distance of about three-quarters of a mile from the Saguenay, and which will be called Kenogami Mills, will be in full running order in June, 1912. Work on the construction will begin as soon as the winter is over, exploration starting next month. The railway branch line from the Lake St. John Railway to the new mill site is practically completed.

It is estimated that the establishment of the mills will mean the creation of a village of something like 4,000 to 5,000 people. The mill alone will give direct employment to about 800 hands. It will consume 30,000 tons of coal a year, 1,800 tons of sulphur, 2,000 tons of lime and 3,000 tons of limestone. The water power will be about 14,000 horse power. The head of water will be 280 feet, one of the highest in the country.

It will be possible to ship by Chicoutimi, St. Alphonse and Lake St. John. The distance from the mills to tidewater is only about 20 miles. There is a wharf where ocean-going vessels can moor, so that direct shipments can be made to Great Britain, New Zealand, Australia or elsewhere.

Mr. Oswald A. Porritt will have entire charge of the mill department. Mr. Porritt has been associated with Mr. Price for nine years, from the time when the Price-Porritt mills were established at Rimouski. Latterly he has been in charge of the mills of the Jonquieres Pulp Company, which have been taken over by Price Bros. & Company, Limited, and will be operated in conjunction with the Kenogami mills. Mr. Porritt has had a long and practical experience in English, American and Canadian pulp and paper mills, which will stand him in good stead in this new undertaking.

The wood department will be under the charge of Mr. McDowall Grosart, of Chicoutimi, who also has long been connected with Price Bros. & Company, Limited, having spent 15 years in the Saguenay district; where he will continue to manage the interests of the company. This department will be called upon to supply a yearly cut of 3,000,000 logs, which will be got out of the Lake St. John, Lake Kenogami and Saguenay districts. The cutting alone will give employment to 1,200 to 1,500 men, and at least a thousand will be needed for the drives.

Keeling & Company's Business Changes Hands

The sawmill and general merchandise business heretofore carried on at Warren, Ont., by Keeling & Company has been taken over by Messrs. Wissler, Wilson & Company and will be continued as formerly. Mr. G. L. Keeling is retiring from business and is moving to Saskatchewan, where he has a son and daughter living. The members of the new firm, Messrs. R. S. Wissler and R. H. Wilson, are old employees of the retiring firm. Mr. Wissler has been bookkeeper and clerk in the store for twelve years and Mr. Wilson has been filer, millwright and foreman in the sawmill for about the same length of time. These two young men are therefore taking hold of a business well known to them, and, possessing as they do the confidence of the public, will undoubtedly make a success of it in the future and maintain the good name and reputation of the retiring firm.

Lidgerwood Company Loses Valuable Officer

Walter L. Pierce, who for thirty-two years had been connected with the Lidgerwood Manufacturing Co., and for twenty-nine years its Secretary and General Manager, died suddenly of heart failure at New York City, on Saturday, December 10, 1910. Mr. Pierce was born at Dorchester, Mass., in 1855. Mr. Pierce's death was entirely unexpected. He had suffered for several years from nervous troubles but was believed to have recovered from them. Mr. Pierce was known to a wide circle of personal and business associates. He was remarkable as an organizer. The coherent organization which he formed is a monument to the efficiency of his work. Besides his connection with the Lidgerwood Mfg. Co. he was Treasurer of the Hayward Co. and of the Gorton-Lidgerwood

Michael Long, one of the oldest residents of Collingwood, died suddenly on December 23. Deceased was seventy-eight years of age and was a native of Ireland. He is survived by one brother, Thomas Long, of Jarvis street, Toronto, and one sister, Mrs. John Byrnes, of Collingwood. Mr. Long was a pioneer in lumber industry.

The Death Emergency Fund of the Concatenated Order of Hoo-Hoo has been brought up to the amount required in order to permit of the making of payments to beneficiaries, and on December 20, the first payments, three in number, were made. A neatly engraved card is being sent to each subscriber to the fund.

CAMP DEPARTMENT

The Lure of the Lumber Camp

"It's a great life, kid; once in it, you won't want to get out. Why, I've seen men cry when the call came for the big breakup in the spring. If you have lived in the cities down the lakes all your life and have never been in the big woods—well—you've missed somethin' that's all. 'Tisn't like it used t' be, though, in the good old days. Most of the old gang is out west now working the big timber. Gosh, how I'd like to see old Joe Bancroft. Say, d' you know, kid, he and I palled for nigh unto ten years, he was the best but H——, what's the use of ——"

Sandy McCutcheon, which will do well enough for his name, leaned against the railing of the St. Louis hotel. A bright-eyed, healthy-looking lad of 18 or thereabouts stood beside him. It was cold but the sun shone and woodsmen don't usually care how cold it is if the sun shines. Sandy had been a champion top loader in his day, but that day had long since past. Now he was just Sandy in every camp in New Ontario. Swamper, sawyer, cookee, driver, he was any of them. He could do anything they put him at. He was too old for the top load job as he had found the previous winter.

His legs were crossed and each time he moved them his corduroy trousers gave out a queer squeaking noise. He wore long boots, a blue flannel shirt, a brown mackinaw and a cap. The brush on his face was as gray as it was unkempt, and from between the brown teeth a bulldog pipe was extended. In the face Sandy was not handsome. Perhaps he was once. Ah, he could remember when he was the big noise at the big doings over at Frontier Bill's, the winter Maggie O'Neil kept the table going. His little blue eyes peered out from under his shaggy brows and his rather large sized face bore many a mark which bore him out in the statement: "Ah, lad, in my day I wasn't afraid of any of them.

A Raw Recruit

The youngster at the woodman's side looked into his face, admiration spelled all over his own. He had never been in the woods—this boy—he had just finished his first season on the lakes. Stranded in the city, he ran into Sandy. The man took him away from the crowded "sailors" headquarters, and they had gone down toward the lake. The boy wanted to know all about it. He had heard a lot. The men on the boats had been there. Many a yarn they had spun, and he was going into the woods this year for the first time.

"Lucky for me I found you," he said. "I want to know all about the woods. I want to go. I want to go and come out in the spring with a stake; go home in the clothes, you know, and surprise the folks.

The older man was thoughtful. He looked the boy over carefully and then he said: "You'll do, kid; you'll do, kid; you'll do. I'll take you with me. We'll bunk together. We'll live in the white man's camp, too, and the great Paul Bunyan will come to the rescue if a 'dag' so much as puts his head in the door. We'll ship together, kid; I'm not agoing to ask your name, I'll do anything and you can get a job ahelpin' the cook. We'll get in right and a great winter we'll have. Come; an old man must have his touch, you know, although I wouldn't advise a youngster to monkey with it. We'll go up to Mike's. He's an old pal. Got my turkey up there. Been in a tie camp all summer. We'll plan it out—go to a Quaker show to-night—mebee, you and me, and in the morning we'll hit for the timber." He slapped the young man on the back and the other smiled, for it was an honor to go into the woods with an old-timer.

Getting "Wised Up"

With their feet on the iron rail inside the conversation was continued: "There's a lot of things I want to wise you up to on—well—some people call it edi-edi. He——, manners," he said. "In the first place don't have nothin' to do with a "dag" or a pussyback. Get in with the white men. Time was when white men was all what could get jobs. Different now, anybody can get a place and no never minds are asked so long as you do your work. Sometimes you are canned even if you do your work. The boss is the whole works, he is the big cheese and he never has been cut into. He knows it too and the best plan is to rub him the right way.

"Wages a'int so good as they used to be. "I'll probably get from $30 to $35, me being an old hand, you know. You will get 'long about from $20 to $25, but then you'll have a snap, you know. All you got to do is make the kindlings, keep lot of wood in the fire, wait on table, be up to start business at three in the afternight, wash dishes, scrub out the cookhouse and the rest of the day is yours.

"Now, don't go nuts as soon as you get into camp. Take it easy like at the same time keeping your eyes peeled so that you can appear like an old one.

"Another little dribble, Mike, and give the kid somethin' soft. We'll have to pay for a job, though. Lord, how I hate to buy a job. Another thing that is different. It'll cost a dollar each and it'll take something for railroad fare. When we get into camp we'll be charged up with another dollar, for hospital fees—attendance that we never get, but never mind that.

"Don't listen to the other guy. They are always movin' about and don't stick anywhere. We want to come out with a roll in the spring. We'll stick to our camp unless one of us gets the hook and if one goes the other goes with him. That's the way old Joe and I used to do, and nine times out of ten rather than see us both go, the trouble would be patched up.

Buying at One Van

"Don't get anything more than you can help at the van. They charge you two prices for it and it's cheap junk, most of it. They like to keep you charged up so that you can't quit for you haven't anything coming. Get your tobacco and shoes and socks before you leave town. Some guys eat up their salary at the van every day thinking they have to have something that they don't need mor'an a cat needs two tails. Take it from an old hand, kid, I know the ropes, and if you listen to your Uncle Jack you'll come out in the spring with a wad. Go the way the most of 'em do and you'll come out as they do—broke flatter than one of Charlie Rich's flapjacks.

"Don't get sassy to a teamster or a foreigner. Just take it easy like and grin. They be some tough nuts around a logging outfit and they'll crack your coco as soon as they'll look at you.

"There'll be a pig close by likely and I don't need to tell you to keep away from that. Them drunks have an awful time and there's hell to pay usually. For them as need it, the best way is to carry it along and plant it. I have to have a little smell every so often and I'll take it along.

"Don't get in a fuss with the clerk. He's the noise that makes out the check. You don't want your wages reduced. If you get sick and have to 'lie in' don't bellow when they charge you board. If you're in right the clerk will forget it. Don't be fresh with the geeks in the cook shanty, come to me when you want advice, and you'll come out all right.

"One more nip, Mike, and give me my turk while you are doing it. Yep, off for the woods, the kid and I. See you in the spring if I don't land a watchman job or something like that. Come on, kid, we'll take in the picture show and then its to the tall and uncut for ours."

Sandy and the "kid" are but two of thousands who went into the woods. The freezing weather hastened operations in the forests, and by the middle of December every camp was busy with a full crew of men.

Employment agents sent out hundreds of men, and the sound of the ax, the saw, and the puffing of logging engines were again being heard where all was quiet during the summer months.

For years it has been said that the timber of New Ontario is about exhausted. If you could see the army that is going into the woods this year it would make you think that there is still work and plenty of it to be done.

Sealers, clerks, foremen and cooks went into the woods to get ready for the great inflow of help. Then they sent out the call that all was ready. Help is plentiful; wages are not as good as they have been in other years.

Many of the companies expect to finish up this year with the pine and they have opened many new camps and are hiring all the men they can get so as to finish. If the weather conditions are right it will be a great success.—Fort William Times-Journal.

Camp Life in the Maine Woods

Life in the Maine lumber camps is not much different from what it was fifty years ago. There are fewer and fewer native woodsmen each year and the men are fed much better than they were in the old days, when pork and beans and salt beef formed the staple articles of diet. Most of the men get far better food than they would at home and the work is easier than a fishing trip on the Grand banks, for instance. Breakfast is served during the winter from 5.30 to 6.30, and the men get to their work by daylight. At noon the cook's assistants carry luncheon to the men and a steaming hot supper is ready when they get to camp at night.

Only those who, through long experience, have become accus-

(Concluded on page 40)

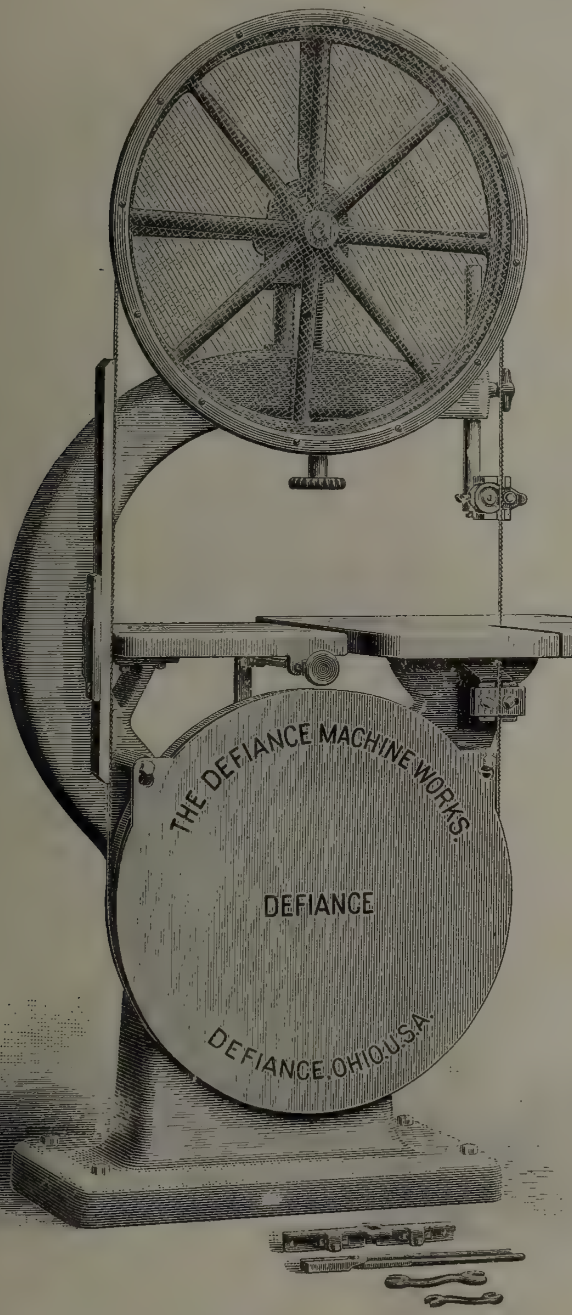
Machinery and Equipment

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

An Important Woodworking Machine

The accompanying illustration shows a machine which is of much interest to wood-workers. It is known as the "28-inch Patent Band Sawing Machine," manufactured by the Defiance Machine Works, of Defiance, Ohio. This is a most desirable tool for piano, and organ factories, pattern work and wood workers in general. The frame is handsomely designed, cast in one piece, with cored center, making it very stiff and reliable and providing a broad floor base to stand firm.

The wheels are 28-inch diameter, 1½-inch face, covered with pure rubber bands, ground true after fitting to the wheels and given a running balance. They are supported upon ground steel spindles of large diameter running in long bronze self-lubricating bearings of the reservoir system. The upper wheel is provided with a screened safety guard and the lower one is covered with a solid iron disc to protect the operator. The tension device is an ingenious affair. It maintains automatically a uniform tension to the saw blade, so that light or heavy sawing in hard or soft wood can be accomplished without fear of the saw blade breaking or running of the wheel.



THE DEFIANCE MACHINE WORKS.
DEFIANCE
DEFIANCE, OHIO, U.S.A.

Defiance 28″ Patent Band Sawing Machine

The table, of iron, in one piece planed perfectly true, is 24-inch by 28-inch and can be instantly tilted to any angle to 45 degrees for conical or bevel sawing. The saw guides are of the patent non-friction type which will not heat or injure the saw. The machine will take material up to 12 inches thick. The saw blade used is 14 feet 10 inches long.

The tight and loose pulleys are 10-inch diameter, 4-inch face, speed 700 revolutions per minute, with the loose pulley constructed with self-oiling reservoir hub and bronze bearings. Each machine is furnished with one ⅜-inch band saw blade, brazing tongs and vice, with the necessary oil cups and wrenches.

Only one horse power is required to drive the machine, and it occupies a floor space of 34 inches by 46 inches.

The Gordon Hollow Blast Grate

Every machine in a mill depends, primarily, on the grate. If the fuel does not burn well, the boiler does not generate sufficient steam, the engine does not exert sufficient power, and every machine in the mill lags. To such an extent is this the case that in some instances it becomes necessary at times to shut down in order to give the steam pressure a chance to rise.

This acounts for the fact that a very large proportion of the saw mills in the United States are fitted with the Gordon Hollow Blast Grate, which adds from 25 to 50% to the efficiency of a boiler, and which makes the user entirely independent of the weather.

This well-known grate can be used in either plain furnaces or Dutch ovens, and with any number of boilers, from one up. It makes no change in construction necessary . It is easy to install and operate. It throws no sparks. It can be fired, when the blower is idle, if desired. This is often necessary at night.

It burns wet or green sawdust, bark, chips, blocks, edgings and slabs, and the fact that snow and ice are mixed with the fuel seems to make but little difference. It saves labor in firing. With proper care it is so extremely durable as to be practically indestructible.

It is sold on approval to any responsible party, thirty days being given in which to test the apparatus. If the purchaser is not satisfied, he may remove the apparatus and notify the company that it is subject to their order. The company pays the freight both ways.

Those interested should address the Gordon Hollow Blast Grate Company, Greenville, Michigan, stating how many boilers they have, and whether they have plain furnaces or Dutch ovens, and giving the width and length of the grate surface or surfaces.

Publications and Calendars

"Wood working machinery," manufactured by R. E. Kidder, 35 Hermon street, Worcester, Mass., is interestingly described in a catalogue which has just been issued. The catalogue is attractively illustrated.

The Heald Machine Company, Worcester, Mass., have issued a booklet dealing with "The American Sash Trimmer," an excellent tool which the company produce and which should be interesting to wood workers.

Frank A. Cutting, 79 Summer street., Boston Mass., has issued a large and striking calendar for the year 1911. The calendar is on separate sheets for each month, and accompanying each month are smaller calendars for the other months of the year. Frank A. Cutting deals in hemlock bark and his calendar tells that he is the only dealer who can furnish shippers with the "Cutting" patent bark car.

The Midland Lumber Company, manufacturers and wholesalers of hardwood lumber, 705-706 Union Trust Building, Parkersburg, W. Va., have favored the Canada Lumberman with a copy of their calendar for 1911. This is one of the most practical and useful calendars yet received, as it contains a large pad with a sheet for each day of the year, and the day and date are clearly printed in large type. The Midland Lumber Company make a specialty of dealing in oak, poplar and chestnut.

The Fraser Bryson Lumber Company, Limited, Ottawa, have issued one of the handsomest calendars which we have received for a long time. The picture with which it is embellished is a beautiful harmony in color, and represents "A Midsummer Day on Long Island," the artist being Thomas Moran, one of the foremost American artists of the day. The picture alone would make the calendar a gem, but its general get-up is very charming. The picture is mounted on a white board set in on a countersunk border. The whole is mounted on a light brown board giving the effect of a narrow frame. The calendar pad is set at the bottom and occupies a space which agrees well with the whole scheme. The Fraser Bryson Lumber Company are selling agents for Fraser & Company, lumber manufacturers, Ottawa, and deal in white pine, red pine and spruce, lumber and lath.

"Midsummer Day on Long Island" is the title of a beautiful colored picture which adorns a calendar issued by the Rothfuss-Howard

Iron Works, Williamsport, Pa. The scene is one which will be admired by all who are fortunate to secure a copy of the calendar, and it will cause man to long for the "Good Old Summer Time," during the wintry days which are now upon us. The artist is Thomas Moran, who is readily given the honor of being the foremost American landscape and marine artist. He was born in Lancashire, England, but came to America when he was only seven years of age. For a short time he studied in England under the influence of Turner, and his indebtedness to the foremost of England landscape artists is clearly indicated in his work. The calendar copy of one of his paintings is reproduced in beautiful color blending and gives one a good idea of the charm of the original.

The H. B. Smith Machine Company, of Smithville, N. J., have issued an attractive catalogue of their machinery under the title of "Modern Molders." The catalogue is printed on a fine quality of calendared paper, in brown ink, and is profusely illustrated with splendid half-tone engravings of the machines described. Sixty-three years of practical experience stands back of the machines produced by this company. During this time the company have built up and made improvements upon a line of machinery which has been copied and adopted by makers and users of wood-working machinery far and wide. In addition to "Modern Molders," the company manufactures a full line of planing, tenoning, mortising, and boring machines and sanders and sawing machines, comprising in all over 150 designs of labor-saving wood-working machinery. They also manufacture special machines to meet special needs.

J. R. Booth, of Ottawa, has issued an excellent calendar for the year 1911, copies of which are being sent out to his friends. "A Breathless Moment" is the title of the colored picture which adorns the caldenar. The painting is by Louis R. Dougherty, a young American artist who was born in Philadelphia, in 1874, and who has made an enviable reputation for himself, both as a painter and sculptor. The picture represents an Indian chief, rifle in hand, kneeling in the snow, alert, with an intense look of expectancy on his face. His keen ears warned him of the movement of some animal in the forest. He is waiting silently for the moment when the game will burst upon his view and come bounding forward to certain death. The picture depicts the intense interest of the Indian forcibly, and about it all there is a splendid faithfulness to nature which will appeal strongly to all who know the woods, among whom are to be numbered all followers of the lumber trail.

The Waterous Engine Works Co. Ltd, Brantford, Ont., have issued a calendar, which, both for usefulness and handsome appearance will be generally admitted to be one of the best that have appeared this season. The upper half of the calendar is devoted to a handsome illustration of the company's plant and the lower half contains the calendar pad, upon which the numbers are large and clear. The calendar is a typical instance of all that should be aimed at in the design of a good advertising souvenir.

The Waterous Engine Works Company have also favored the "Canada Lumberman" with a copy of their "Log Deck Machinery" catalogue. This is one of a line of sawmill machinery bulletins which the company are now issuing. It is printed in two colors and well illustrated with exceptionally fine halftones. It shows the latest models in this class of machinery and would be a valuable reference catalogue in any sawmill. The company will gladly send a copy of the catalogue free to any address.

"The Use and Care of Band Resaws," is the title of an attractively published catalogue issued by Wm. B. Mershon & Company, the band resaw specialists, of Saginaw, Mich. The catalogue which is printed in brown ink, upon a soft creamy yellow paper, has a very inviting appearance. It not only serves the purpose of a catalogue (being by the way the ninth edition of this book), but gives a good idea of the scope of the company's work. It is now over 20 years since the company commenced the use of band resaws in their business, and nearly 20 years since they commenced to build them. By devoting their entire attention to the subject of band sawing and band sawing machinery, they have been able to reach a state of perfection in the manufacture of their product which is a source of great benefit to all users of such machinery. The new edition of the catalogue is splendidly illustrated and will be welcomed by all who are fortunate enough to secure a copy. The company will be glad to send a copy to any one who is interested in their line of machinery or in the care and fitting of saw blades. An excellent feature of the catalogue is the large amount of space devoted to useful tables and information pertaining to band saws as well as a practical treatise on the use and care of band saw blades.

One of the most welcome calendars which come to the Canada Lumberman each year is that issued by Scatcherd and Son, Hardwood Lumber dealers, Buffalo, N.Y. The calendar comes in the form of a pad with spaces provided for each business day of the week, upon which may be entered the important engagements which are made in advance.

The American Wood Working Machinery Co. have presented the Canada Lumberman with a useful calendar, upon which are shown, not only the days of the current month, but, in an insert, on either side of the month, smaller calendars for the month preceeding and the month following. The calendar is attractively illustrated with a number of pictures of the plant of the American Wood Working Machinery Co., and of the numerous types of machines which they manufacture.

C. A. Spencer, wholesale lumber dealer, 55 St. Francois Xavier street, Montreal, as usual, has remembered his friends at Christmas time, and has presented them with a calendar which is certain to be welcomed by its recipients. The picture upon the calendar is one of an attractive young lady, and the color scheme, which is in rich yellows and reds, is one that immediately attracts admiration. The picture is mounted upon a dark board and the calendar pad, placed at the bottom of the mount, is sufficiently large for practical purposes, yet not large enough to interfere with the excellent conception of the calendar as a whole.

B. C. Forestry Legislation Postponed

It is understood that during the coming session of the B. C. Legislature there will not be any comprehensive legislation with regard to the forests of the province. The report of the Forestry Commission is so complete and covers the subject so fully that time will be required to digest its recommendations fully. The report was presented so late that hardly sufficient opportunity has been afforded to consider its contents, while the subjects involved are so far-reaching and so important that hasty measures would be unwise.

To delegations which have discussed the matter with the government, it has been intimated that though legislation may be submitted, it is hardly possible for any to be passed this session. The probable course to be pursued will be that Hon. William Ross, Minister of Lands, will draft a bill which will be presented to the House and distributed to those interested. The measure will then be left over for a year, so that the views of all those affected may be ascertained.

New Vicegerent Snark for B. C. Mountain District

W. A. Anstie, the well-known secretary of the Mountain Lumbermen's Association, has been appointed Vicegerent Snark of the Concatenated Order of Hoo-Hoo for the Mountain district of British Columbia. The appointment and the decision to create this new district of the Order was made a few days ago by the Supreme Nine in secret conclave at Index, Wash. Previous to the decision to create a special district for the interior of British Columbia, the business of the Order was conducted from Vancouver, where the Snark, who at present is Mr. Arthur Hendry, had his headquarters. The number of members in the Mountain district has become so large, however, that is was decided to create a special district. Mr. Anstie proposes to call a concatenation of members of the Order about the end of January, when the annual meeting of the Mountain Lumbermen's Association usually takes place.

Camp Life in the Maine Woods

(concluded from page 38)

tomed to it can sleep with comfort in the average lumber camp after the snow has come. A huge box stove of cast iron stands in the centre of most of the camps and the bunks are arranged on either side, usually with the feet of the sleepers extending along a central aisle. Mittens, leggings and other articles of clothing, which are caked with frozen snow, are hung on lines suspended over the stove, and, in order to dry them thoroughly, a rousing fire, which frequently heats the stove red hot, is built. The steam that rises from the frozen garments, together with the heat, makes sleep out of the question for those who are unaccustomed to the life.

The old-time chopper is gradually passing. His place is being taken by Canadians, who drift over the border from the provinces, and by men who are shipped from the big cities by the employment agents. Many of the latter are absolutely worthless and nearly all of them are without experience. This doesn't matter so much, however, on the end of a buck saw as it would if they were expected to swing an axe.

Nearly all the trees are sawed instead of chopped down as was formerly the case. They are taken much nearer the stump and a large part of the waste which followed when an axe was used is done away with. This is in line with the general policy of most operators to adopt modern and scientific methods in lumbering. They have discovered that the old, wasteful customs can no longer be followed successfully. The margin of profit decreases each succeeding season, and in order to make lumbering profitable, every foot of timber must be utilized.

WANTED & FOR SALE DEPARTMENT

PUBLISHERS' NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Employment Wanted" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies.

Advertisements of "Employees Wanted" will be inserted at the rate of two cents a word net. Cash must accompany the order.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

WANTED—LUMBER, ETC.

Wanted to Buy for Cash

WOOD SLABS AND EDGINGS, IN ANY quantity. C. E. FIZETTE, 265 Davenport Road, Toronto 1-4

White Pine Wanted

WHITE PINE 2" AND 3", 6, 7, 8", 10" AND 12", length 10 to 30 ft. for tanks. Also qr. cut Pump Tubing. ONTARIO WIND ENGINE & PUMP CO., LTD. Toronto, Ont. t.f.

Cedar Posts Wanted

WANTED FROM TWO TO FOUR CARS Cedar Posts from 3 to 5 inches top end. Name best cash price and point of Shipment. Apply Box 195, Jordan, Ont. t.f

Pump Squares Wanted

WE REQUIRE 5" x 5" AND 6" x 6" QUARTER cut White Pine Pump Squares Good price for the right material. ONTARIO WIND ENGINE AND PUMP CO., LIMITED, Toronto, Ont. 1-4

Basswood, Birch and Elm

FIVE TO 10 CARS 4/4 X 6 AND UP 1S AND 2S Soft Elm Two cars 4/4 x 6 and up 1s and 2s White Basswood. Two cars 4/4 x 10 and up 1s and 2s Birch. LUCAS E. MOORE STAVE CO., 11 Broadway, New York, N.Y. 1

WANTED

ONE TO TWO MILLION FEET OF BASSwood, Elm, Ash Pine and Cedar logs and ties delivered to Georgian Bay, on North Shore or Manitoulin Island. State price and quality expected. Box 177 CANADA LUMBERMAM, Toronto, Ont. 1-tf.

Birch, Basswood, Ash, Elm

WANTED FOR SPRING DELIVERY TWO to thirteen million feet of Birch, Basswood Ash, Elm or other hardwoods. Would advance sufficient cash to help pay for logs and manufacture of same Apply Box 175, CANADA LUMBERMAN, Toronto, Ont. 24-1

Logs Wanted

WE WANT LOGS FOR EARLY SPRING sawing in our Penetang Mill, capacity 120 m. feet per day, lowest insurance rate on Bay, best results as to grade sawing, and economy of material. THE FIRSTBROOK BOX CO., LIMITED, Toronto, Ont. 1-4

Wanted
Two Million Hard Maple Lumber

1 INCH TO 4 INCH THICK FOR SHIPMENT soon as dry or can accept quantity soon as sawn. Spot cash. Inspection at mill. Apply for further particulars to Box 164, CANADA LUMBERMAN, Toronto, Ont. 4

Freehold Spruce Lands

SIX HUNDRED ACRES, WELL COVERED with Spruce and other Pulpwoods, also in a promising Mineral Belt.

Being held in fee simple; there are no restrictions as to export, and being close to Lake Superior and intersected by the Canadian Pacific Railway it offers great convenience for shipping. For quick Sale to close an estate. Special price quoted.

tf. WILLIAMSON, Publisher, Toronto.

Retail Lumber Dealers and their Insurance

In line with a recent editorial urging owners of retail lumber yards to keep close check on their tivity that assures more prompt value, Bird Critchfield, secretary of the Nebraska Lumbermen's Mutual Insurance Association, has made an interesting investigation of retail lumber yard policies in his state, and makes known his findings in a circular addressed to the members of that organization, says the American Lumberman.

He says he visited over one hundred towns and inspected about 150 lumber yards during the last six months, personally examining 75 policies of insurance now held by dealers visited. At least 10 per cent. of the policies examined were defective, and in some cases worthless. In 20 per cent. of the yards visited dangerous exposures, such as piles of straw, shavings, dead grass and weeds, oily floors, gasoline tanks, automobiles, etc., were left about. This should not be, for the reason that from these hazardous risks and careless managers comes the tendency to raise the rates on lumber yards as a class. He sums up his advice as follows:

First. Examine your policies and satisfy yourself that you have enough insurance on your property to cover a loss, should a fire start in your yard. A fire in a lumber yard usually makes a clean sweep.

Second. Read each form attached to the several policies and see that all read alike as to the property covered.

Third. If you allow gasoline tanks, automobiles or other machinery using oil about the yard or sheds you should notify the companies and get permission.

Fourth. Careful owners or managers will provide two or more barrels filled with water and placed at convenient places about the yards, with a bucket marked "fire bucket" hung above them, ready for emergency in case a small fire should break out.

These are all good points for the retail lumberman to remember. He is always looking for opportunities for investment that will yield good returns. He is quite willing to invest a little money or spend considerable labor if he thinks it will produce a profit. It is doubtful if anything else can be done that will yield as certain returns as the exercise of a little thought in the examination and supervision of insurance policies and a little labor in cleaning up the yard and reducing the fire risk. The latter effort, especially, will pay a prompt profit in the reduction of risk and possibly in the reduction of premium.

A large percentage of the fire risk in this country is not the result of unavoidable conditions, but rather of carelessness. Littered yards, oily sheds, dry grass and lack of fire apparatus all are unnecessary dangers which can easily be avoided. The retailer whose alleys are choked up with high and dry grass, and who sometimes, in the dull season, wonders what he can find for his yard hands to do, can employ them in no more profitable labor than in getting out the inflammable material and picking up the odd ends about the yard, in generally putting the yard in shipshape and fire resisting condition.

It is easy to advise the retailer how to buy and how to sell profitably, but these things depend somewhat on the state of the market. It is easy to advise the retailer how to collect his accounts, but that depends somewhat on the disposition of the other fellow. Economy and the reduction of fire risk, however, are dependent entirely upon himself. He will look in vain for any outlet for his ac-and certain returns.

The Farmer as a Retail Customer

The country trade of the ordinary retail lumber yard varies with location. In the city it is small; in the large city almost nothing. In the country town it may represent all the way from 60 to 90 per cent. of the business. The retail lumber dealer may sometimes be inclined to think that the farmer trade is his chief cause of grief, yet it is possible that many a city yard man would be glad to swap his business for that of the country dealer. More than that, the business of the country dealer, even though smaller in volume, might show a larger net profit than that of his city brother. The city business is conducted at a larger overhead expense. It is possible, the city and country men being equally good collectors, that the loss on bad accounts is larger in the city than in the country.

The farmer is notoriously slow pay. His cash trade is small and he expects long time on his purchases, and without an interest charge. But there is this to be said in favor of the farm trade: Payment is reasonably sure. The farmer is not a fly-by-night member of the community. An occasional renter represents bad credit, but, as a rule, lumber bought by the farmers is bought by men who are living on lands of long tenure or even farms handed down from father to son. They are making permanent improvements in the community in which they expect to remain, and they are jealous of their reputations as debtors. They may be slow to pay but they pay ultimately if the retail manager's collection system is any way effective.

The ordinary farmer, while he is a close figurer, demands quality first. He has some ideas concerning lumber—ideas, it is true, that are often out of date—but it will be observed that these ideas have chiefly to do with the quality of the stock. As to price, his chief desire is that he shall be able to buy as cheaply as his fellows. He does not resent the dealer taking a profit, but he does resent paying the dealer a larger profit than is secured from some other farmer or the town buyer.

Town trade runs largely to the patronage of the contractor and the house builder. These men, as a rule, know more about lumber, and yet they are more interested in the question of price than in the matter of quality. The retailer who has a large contracting trade, unless he is constantly on his guard, will find that he is selling lumber at a pretty narrow margin of profit. The town trade often represents volume of business without a great amount of reward. Nothing is more deceptive than large figures, and a small barn bill at a proper profit may contribute more to the right side of the dealer's ledger than a big contract for which half a dozen dealers have been fighting. The contractor is an adept at putting two or three dealers into the ring and letting them "lambaste" each other until the price is flattened beyond recognition.

The farmer may be slow to pay, but he pays ultimately. He may be particular as to his wants, but he is a good advertiser when his wants are satisfied. Lastly, he is buying for himself and is not endeavoring to make a profit from both seller and consumer.—Am. Lumberman.

REDWOOD.—The name "redwood" is used commercially to cover two distinct species, the coast redwood, which grows chiefly in a narrow belt along the coast, north of San Francisco, and the "big tree," which is confined to a limited region on the western slope of the Sierras. Only a small amount of "big tree" lumber is manufactured, however, nearly all of the commercial supply of redwood being furnished by the coast species. Redwood is unique in that it is cut in only one state, California, and in very restricted portions of that state.

AMERICAN OUTPUT OF OAK.—The cut of oak in 1908 was but little more than three-fifths as much as in 1900, and it is probable that the total cut of oak lumber will never again be as great as it was in that year. The supply of oak in the northern states has been largely cut out, and now the southern states are being heavily drawn upon. In 1900 Indiana ranked first in oak production, with 649,794,000 ft., or nearly four times as much as in 1908, and in the same year Ohio was second, with 596,618,000 ft., or nearly three times as much as in 1908.

Invested in Pulp

According to the Pioneer Western Lumberman, ten million dollars will be required to pay the army of lumbermen at work in the forests of the Northeast—Maine, New Hampshire and Vermont, and the provinces of New Brunswick and Nova Scotia—this coming winter. There are in this peaceful army of loggers 70,000 men. They are accompanied by 22,000 horses, and the fruits of the campaign will not be fallen capitals and confiscated territory, but a crop of 2,500,000,000 feet of pine, cedar, spruce, hemlock and birch. In Maine the harvest for pulp mills will reach the enormous total of 350,000,000 feet.

In answer to a correspondent who wishes to know the best type of floor for a saw mill and joinery works situated in a town, so as to minimize the vibration as much as possible, the Timber Trades Journal says: "Speaking generally, we think a well-supported joist floor is the best for resisting the jar and vibration of high-speeded machines, as it is stiff and unyielding. A plank floor supported on girders will carry a heavy load, but it is springy, and not so well suited for this particular duty. If the ground floor has to carry much heavy weight in addition to the machinery it can hardly be made too strong. We should recommend you to consult an expert in these matters to avoid after trouble."

A correspondent of Timber Trades Journal, asking for a good and safe dressing for hard leather belting, receives the following reply:—"Thoroughly clean the belting and apply a dressing of mutton fat and beeswax in equal parts, or an application of Tanner's dubbin; this will render the belt pliable and prevent it cracking. Castor oil, mixed half-and-half with pure tallow, is also recommended."

Review of Current Trade Conditions

Ontario

Although the end of the year, as a rule, finds the lumber trade of Ontario in a rather dull condition, this is less the case at the present time than is usual. A particularly satisfactory indication of conditions is the fact that there has lately been a good movement of stocks of dead cull white pine. A large mill in the Georgian Bay district, for instance, which had over three million feet of dead cull pine at the latter part of the summer, now has only 800,000 feet. Even the mill culls are being bought up pretty close. A shortage of hemlock is reported in 2" by 8"—16' and in fact in pretty nearly all 16' lengths and also in hemlock boards. There are indications, in fact, that there will be higher prices for all hemlock stocks. After the low prices which have prevailed all summer, it will be a welcome change if even the cost of production can be secured regularly.

A wholesaler who has recently been covering the chief consuming districts of the province informs "The Canada Lumberman" that he believes there will be a considerable shortage of lumber this spring. Quite a number of the mills were not cutting this year and a large portion of the stock that is in the hands of the mill men today has been sold. It will be late in the spring or early in the summer before the new stock can reach the market. Retail yards are not over-stocked. There are exceptions to this, of course, but taking the yards on the average, their stocks are low. This will make an active buying demand in the spring, and there will probably not be sufficient stocks to meet the demand. Lath have weakened a little of late. Spruce is pretty firm. There is a scarcity of 6-inch pine strips. There is no change in the demand for good lumber. It continues in good demand with firm prices.

Shingles are somewhat firmer and there is a fair prospect for an advance of from 10 to 15 cents for February shipments. The improved feeling among the hemlock manufacturers is looked upon as an excellent sign. Not only is there an apparent scarcity of supplies but prices have advanced. As far as can be learned at present, the supplies now available are no more than sufficient for the market to absorb. Indications also are that during the winter, the cut of hemlock will be smaller than last year.

The trade in hardwoods continues to be satisfactory. There has not been a great deal of buying in progress during the last two or three weeks, except for future delivery. All the trade indications, however, are good and enquiries for the future are considerable. The Ottawa export market is very strong, both in birch and basswood.

At Ottawa the larger contracts which are made annually about this time are now being entered into and as a general rule last week's prices are prevailing. The demand from the United States is a little better than it was at this time last year. There is very little trade in progress in the lower priced lumber and shingles. Hemlock and spruce are about the same price as they were a year ago, though there is a tendency towards higher prices for the better qualities. Box and mill culls are quiet and spruce lath are scarce, selling at from $2.50 to $2.75.

Eastern Canada

The Boston market for spruce lumber has not been very active of late, but prices are well maintained. It is expected that prices will become very firm before the winter mills are well under way. The production to-day is much smaller than usual and manufacturers are accordingly able to obtain the prices they ask for, even though the demand is quiet. There is not much improvement in the demand for random, although dealers are talking about higher prices. Covering boards have been rather dull. Shingles show no change. The best brands are being quoted at $3.40, though $3.25 is about the highest price paid. Extras are being sold at $3.15. The market for lath continues quiet. Prices are somewhat lower than they were a few weeks ago. For 1 5-8-inch the quotation varies from $3.90 to $4, and for 1 1-2-inch from $3.50 to $3.60. Hemlock at New York continues in fairly good demand and wholesalers report numerous orders, which indicate a fair trade throughout the winter. There are no changes in the spruce market at New York to report, but wholesalers state that the eastern mills are asking higher prices.

Great Britain

Bad weather and the elections followed by the holiday season, have had rather a distracting effect upon the lumber trade in London, and, in fact, throughout Great Britain. Spot markets have been particularly quiet, but recently there has been a rather encouraging increase in the amount of forward buying. Deliveries at London for the week ending December 10, amount to 4,214 standards, against 5,925 standards during the corresponding week of 1909. At Churchill & Sim's final auction sale for the year 3 x 9 third Quebec 13-foot sqruce sold at £10 and £9 15s.; 3 x 11 St. John City cut, 1, 2, and 3, brought £10; 3 x 9 brought £9 10s. and £9 5s.; 3 x 8 brought £8 5s.; 3 x 7 brought £7 15s., and 3 x 6 brought £8 and £7 15s. There is still a good demand for planed boards, both yellow and white, and prices are well maintained.

At Liverpool, business has recently been decidedly flat. Soft woods in general are dull. Spruce deal arrivals are now confined to small liner parcels from St. John and Halifax. Liner parcels from Halifax, of poor specification, are reported to have sold at £7 12s. 6d. per standard c.i.f. to the Liverpool district, which is nearly equivalent to £8 2s. 6d., c.i.f. for St. John, N.B. The spot spruce market seems to have touched the bottom, and if any changes occur they must be in the upward direction. Stocks are not heavy, and if the demand improves at all, prices must advance. With a normal demand even, it is believed that prices will remain steady with an upward tendency. Stocks are composed largely of 11 x 3 and 9 x 3, most of them being 14 feet and under. There are very few 3 x 7 and 8-inch, in lengths over 17 feet. There is also a scarcity of 7 x 2 1-2 inch.

Pitch pine markets remain very steady, but the transactions in the c.i.f. market are rather limited. The demand for hewn wood is slight. but stocks also are small. Sawn lengths are in fair demand.

An improvement is noted in the c.i.f. and spot markets for birch, both of which were already strong. Logs and planks are selling well and stocks are disappearing. Fresh wood in log or plank is generally sold almost before arrival. There is an improvement in the demand for the better quality of pine deals and firmer prices are not unlikely. Shippers are reported to be already advancing their prices for next year's goods.

United States

The lumber trade in the United States since the middle of December has taken on its customary winter character. Buying fell off to a minimum for the balance of the year. Throughout the latter end of December the reports indicated a general dullness. There are some features in which the southern pine situation shows an improvement. The demand on building account continued actively until the end of the year. Throughout the year there has been a heavy movement and stocks at mill points are not alarmingly heavy. The situation at present is one which concerns prices more than anything else. Producers claim that they need better prices in order to make ends meet. It will need an extraordinary demand however to bring about an advance. Trade at Chicago has shown a considerable decline during the holiday season. Stocks on hand at Chicago are about 275,000,000 feet, which is a little less than it was a year ago. Northern pine is seasonably quiet at Chicago. Local yards have fairly large and well assorted stocks. For the upper grades the prices continue firm, but there is only a limited demand for Nos. 4 and 5 and prices are weak. Stocks of No. 4, however, are rather low. There is plenty of business going on at Chicago hardwood yards.

A good enquiry is reported for car lots for January and later delivery, though for immediate shipment enquiries are scarce. Dry hardwood stocks at mill points are light, particularly in the upper grades. Plain oak is still the leader and wholesale shippers are finding it difficult to secure sufficient stock. Quarter sawed white oak is selling steadily. Red gum shows some improvement. Bottonwood also is in better shape, especially for the box grades. There is considerable activity in white ash and chestnut. Birch and maple are moving more actively than any other woods. Soft and rock elm are in fair demand with prices steady. Basswood is quiet with an improved enquiry. The hemlock trade at Chicago is in fair condition. Orders are numerous and a good winter trade is expected. A normal stock is expected to be taken out during the present winter. The cooperage trade at Chicago continues very dull.

Low prices in box white pine lumber are complained of at Buffalo. Some dealers assert that lower prices have been made than the prices for yellow pine. Higher grades, however, are improving, with prices steady and willingly paid. The dullness of the low grades is largely due to the heavy stocks. Hardwood dealers at Buffalo are not carrying large stocks. An improved trade is looked for towards the end of January. Plain and quartered oak are selling well and prices are firm. Beech and chestnut are fairly active. Black ash is moving well. Hemlock has been rather quiet at Buffalo, but recently under special inducements large sales have been brought about. Prices for yellow pine at Buffalo have not been very satisfactory of late.

Brisk Demand in England for Canadian Pine

The pine market is very firm, and there is every appearance of a brisk demand for next year, says the London, Eng., Timber Trades Journal. The shipping disputes having been now settled, there will be a call in the shipbuilding centres for best pine sidings and other goods, and it is generally understood that the stocks in merchants' yards are exceptionally low. The reasons for the higher prices now asked for the best qualities of pine are the increased cost of stumpage and

E. C. Barre, Assistant Manager

other items in Canada, and the very light stocks over-wintering. As regards the lower qualities of pine, they are now slow of sale in this country, and much neglected for cheaper substitutes. We understand that next season's cuts of pine at the Ottawa valley mills have been disposed of at an advance on last year's figures: the productions of J. R. Booth in red and white pine having been cleared, as usual, in equal quantities by J. Burstall & Company and Robert Cox & Company, respectively; the Hawkesbury cut has been secured by W. & J. Sharples, and the Edwards cut has gone to Watson & Todd. The following is the statement of shipments of wood goods to the United Kingdom, Continent and South Africa by the principal shippers from the port of Montreal, seasons 1910 and 1909:

Shippers	1910 No. of Feet B.M.	1909
Watson & Todd	34,684,863	35,542,107
R. Cox & Co.	20,181,398	18,804,045
W. & J. Sharples	11,014,202	9,655,706
J. Burstall & Co.	10,501,571	10,578,598
E. M. Nicholson	8,659,301	6,594,976
E. H. Lemay	8,341,101	11,442,989
Dobell, Becket & Co.	3,565,954	5,157,003
Cox, Long & Co.	2,448,189	914,432
Graddon & Owens	1,526,197	671,176

The Quebec spruce prices have an upward tendency, in sympathy with the rise in other Canadian goods, and also due to the fact that the production is an annually decreasing quantity. As an instance, we hear of a sale of first quality 11-inch at £20 landed, but, of course, this was for an exceptional specification. The market for Lower Port spruce deals may be summed up in a very few words—stagnant but steady. There is very little being offered by liners; in fact, we do not hear of any forward contracts having been made for shipment for liners, and what there is coming on consignment should realize full values according to specification. At the time of writing, there is one full cargo on the way to Manchester, and, in the absence of liners, this should meet with a fair sale, although, from what we can gather, there is not an overwhelming demand for spruce at present, but as most of the recent cargoes will have been moved from the quays by the end of the present month it should help matters considerably.

Market Correspondence

Improved Export Trade

Ottawa, December 24.—The Secretary of the Canadian Lumbermen's Asociation, Mr. Frank Hawkins, of this city, has issued an important letter to members, on the imports of lumber into the United States in 1909 and 1910. The figures were obtained from Washington.

The total import of manufactured lumber into the United States for the 10 months ending October 31, 1909, was 794,534,000 feet, valued at $14,578,199. The import for the corresponding months of 1910 was 784,742,000 feet, valued at $14,695,382.

Of the total import for the 10 months of 1909, there came from Canada 786,962,000 feet, valued at $14,349,294. For the same months of 1910, there was imported from this country 776,531,000 feet, valued at $14,423,348.

Thus while the imports from Canada during the 10 months of 1910 were 10,431,000 feet B.M. less, the total price was $74,054 more than for the corresponding months of the year before This indicates an increase in the export from this country to the United States of the higher priced lumber and a decrease of the lower priced stock.

The average price per M. feet of lumber going from this country to the United States in 1909 was $18.36, and for 1910 it was $18.57. The pulpwood, rough, peeled or rossed, imported into the United States (practically all from Canada), was valued at $4,900,903 for the 10 months ending October 31, 1909, and at $5,525,907 for the same months in 1910, showing that in spite of the restrictions, the export of pulpwood from this country last year increased by $625,004.

The total imports of wood pulp, mechanical and chemical for the 10 months in 1909 were valued at $8,135,794, and for the corresponding period in 1910 at $10,695,008. Of this, Canada exported wood pulp to the United States to the extent of $3,008,474 in 1909, and $3,908,399 in 1910.

A great increase is noted in the imports of printing paper for books and newspapers. The United States imported $853,173 for the 10 months in 1909, of which $605,435 came from Canada. In 1910, for the 10 months, the United States imported $1,927,873, of which $1,673,507 came from this country. Canada's export of paper to the United States thus increased by $1,068,072.

The increase of the United States tariff has affected the shingle trade for Canada's export to the United States of shingles in 1909 was valued at $1,828,220, and in 1910 only $1,237,810 for 10 months.

Arrangements are being made to hold the annual banquet of the Lumbermen's Association in Ottawa on February 6.

In the larger lumber contracts being signed from time to time this month between manufacturers and wholesalers, last year's prices prevail. The large contracts of Robert Cox & Company, of Liverpool, and J. Burstall & Company, of Quebec, with J. R. Booth, are about closed, with practically no changes from last year. The W. C. Edwards Company state that the demand from the United States is a triffle better than it was last year. Lower priced lumber and shingles are still off. Some wholesalers announce that they are being offered hemlock and spruce at about the same prices as last year. There is a tendency toward a little higher price for the better qualities, such as good, dressing and shipping culls, particularly the thicker shipping culls. Box and mill culls are stationary. Lath is pretty closely shipped up and is a little stiffer than a short time ago. It still keeps between $2.50 to $2.75.

Teams are being rapidly shipped up to the woods, but a few car loads are waiting for the lakes to freeze harder. There will not be quite so many teams shipped to the shanties this year as last winter. While the cutting in Ontario will be about as heavy as ever, there are not so many camps operated on the Quebec side. This is claimed to be the result of the Quebec stumpage dues. The E. B. Eddy Co. only have four camps this year, and had seven the year before. The Pembroke Lumber Company have no camps this year at all in Quebec.

The frost set in, in the Ottawa valley earlier this year than last and conditions have been particularly good for logging operations. There is, so far, a scarcity of snow.

The W. C. Edwards Company are cutting between 4,000,000 and 5,000,000 feet of hardwood, maple and ash, in small plants in the north. This is all to be used for manufacturing operations by the firm.

The Riordan Paper Company, of Montreal, are cutting about 7,000,000 feet of birch along the Upper Rouge.

Quiet Trade at Montreal

Montreal, Dec. 27.—Trade is exceptionally quiet in Montreal, more quiet indeed than is customary at this time of year. There appears to be little business moving either amongst the wholesale or retail men. "We do not look for things to really wake up again before the middle of February," said one big dealer this morning. "Prospects, however, look promising for the future, and that is very consoling during these times."

Mr. Wm. Rutherford, the well known lumber merchant, is a candidate for Mayor of Westmount and has good hopes of success. For some years he has been a member of the council, and has recently been been chairman of the Roads Committee.

A new German invention substitutes a steel wire for the axe and saw for timber cutting. The wire is about one millimetre in diameter and is kept in rapid motion by a small motor. The swift motion heats the wire and it cuts with great facility, producing a slight carbonization of the wood. A trunk 20 inches in diameter is cut by this method in six minutes.

Application for incorporation has been made by G. H. Randall & Company, Limited, with a capital of $100,000. The firm will deal in lumber of all kinds and asks for very broad powers, embracing the manufacture of articles in wood or wood and metal and the operation of steam and electrical power for themselves and for sale.

U. S. Paper Mills Anxious About Pulp Supplies

There has lately been a great awakening in the north eastern United States, to the serious shortage of pulp wood, which threatens the paper makers of that country, and they are beginning to feel that a mistake has been made in the past, when Canada was treated so cavalierly in the matter of tariff. The paper mills of the United States will need the pulp wood of Quebec in the future, but they will not be able to get it, as the Government of Quebec will no longer permit the export of this valuable raw material. There is a belated repentance in the United States to-day, and numerous articles appear in the press, calling upon the Government to endeavor by reciprocity negotiations, to persuade Canadians to allow their pulp wood to be exported. If the writters of these articles understood the strength of the sentiment in Canada against the export of pulp wood they would realize that it is fruitless to agitate for a renewal of the old conditions. Canadians will welcome any brotherly treatment in the direction of reciprocity and will meet it in a brotherly spirit, but it is no exaggeration to say that there are much fewer favors of this nature which, we desire in this country today than there were a few years ago, and that nothing that the United States could offer would be sufficient to compensate for the destruction of our pulp wood resources for the benefit of United States mills, and at the sacrifice of the paper-making industry of Canada.

Reducing Outstanding Accounts

To keep outstanding accounts at a minimum, Wm. Krotter makes the following suggestions in the American Lumberman:

Do not let the account begin at all when, as is often the case, a little close questioning at the time credit is asked for will reveal a way for the customer to meet the obligation in cash. There are often other places where he can borrow the money if necessary, or an exchange of debits can sometimes be effected, making it unnecessary to open the account at all.

A very clear understanding should be had when credit is given as to how settlement is to be made and as to time of payment. We get the best results by making out notes drawing the highest legal rates, with no interest charged if paid on or before maturity. This in case the time given is not to exceed thirty or sixty days. Where the amounts are small and are charged to open account, statements are, of course, rendered promptly at the first of the month and personal letters are written if at the date of sending out the next notices and statements the past due accounts have not been met or some satisfactory arrangement made as to extension of time.

The filing of mechanic's liens and the taking of security at the time sales are made, if the risk is not considered first-class without this, are also good helps toward insuring prompt payment or at least that payment will not be indefinitely postponed.

A good understanding established by the manager with banks, building and loan associations and individuals who have money to lend usually is productive of the best of results in the matter of insuring payment of the larger items, such as house and barn estimates, bridge bills, etc. In case of sales to road districts, townships and counties, a prompt filing of the itemized bill with authority for delivery of it attached in proper form will insure the best results in the payment of such claims, and promptness in this respect will often represent the difference between profitable and unprofitable sales of this class, since the claim carried for six months or a year without interest frequently will offset the profit on the bill.

Collections in both large and small amounts should be watched closely throughout the month, not neglecting, of course, to make the special collection trip promptly on the first of each month.

Guarding Circular Saws

The most dangerous machine in any wood-working shop is the saw bench, and the smaller and more innocent it looks the more dangerous it is, as I will endeavor to explain. Take the large self-feeding benches first. They look fierce enough to the uninitiated, even when they are at rest, especially if they have large and wide-spaced teeth. Should a visitor to your mill see a large circular at work, he invariably shudders when he thinks of the possibilities that might occur. But, happily, his fears are more imaginary than real. Those terrible and fearsome tools are really very tame and docile after all. They usually have a very good guard fixed to them, while the feeding gear prevents the operator's hand from coming into contact with the saw. They also are more used for large and heavy work, so that there is not much danger of the saw throwing the wood back.

But with the small benches it is quite different. The sawyer has to push the wood past the saw with his hand or a "shove stick," consequently he runs a greater risk of cutting his fingers than the man on the large bench does. Although the front of the saw is responsible for a lot of missing fingers and badly lacerated hands, there is far more danger to life and limb by leaving the back of the saw unguarded, or insecurely guarded. Many very serious and fatal accidents have been caused by pieces of wood being thrown back by the saw. Thin strips and loose knots, and even large pieces will be hurled back with terrific force should they happen to catch the back of the saw as it comes through the bench; so it is the back of the saw that wants guarding most, and the guard should be as close to the saw as possible. How many small benches do we find efficiently protected? Very few indeed. Perhaps the saw is so small that it is not considered dangerous enough to have a guard. Perhaps the factory inspector did not find fault with it, and so they are left until an accident occurs. Then, perhaps, a guard is fitted to it. That reminds me of the old woman that bought a pair of boots and put them away in a cupboard until the heels would wear down a bit.

Don't wait until some poor fellow is mained before buying a guard. Get one at once for every saw, and get a good one. There are plenty on the market; some of them, certainly, have room for improvement, while others seem to be "ideal," as they guard the saw back and front, while they do not prevent the saw from being used up to its limit, which is a great advantage on a small bench, as you have often to cut various thicknesses, and often very short lengths. What is wanted is a reliable guard that will suit various sizes of saws, and will admit any thickness of wood (up to the limit of the saw), without having to make tiresome adjustments.

A saw will cut anything that is pushed against it, even your fingers, as I have cause to know. But there is no sentiment in their composition. So don't monkey with a circular saw.—J. M. N. in Timber.

EDGINGS

Ontario

Graham Bros. & Co., lumber manufacturers and merchants, Kinmount, Ont. are stated to have assigned to George A. Jordan.

A by-law granting the Pearce Lumber Company, Limited, a fixed assessment has been passed by the ratepayers of Marmora, Ont.

The MacKenzie-Mann interests are reported to be negotiating with the Ontario Government to secure large pulp areas in the Nepigon district.

The F. N. Burt Company have arranged for the acquisition of the Dominion Paper Box, which has the largest paper box business in Toronto, and is a prosperous company well established in business.

The Spanish River Pulp and Paper Mills, Limited, capital $4,000,000, have secured incorporation. The head office is at Toronto. The incorporators include W. J. Sheppard, Waubashene, J. B. Tudhope, manufacturer, Orillia.

Mr. John E. Cutler, of Welland, Ont., whose planing mill was recently destroyed by fire, proposes to build a new and substantial plant, partly of concrete, provided he is given a fixed assessment of $1,000 a year for a period of ten years, for all municipal purposes except school taxes and local improvements.

The Tekton Manufacturing Company, Limited, Niagara Falls, Ont., capital $40,000, have been incorporated to manufacture and sell lumber and building material, etc. The incorporators include H. D. Ruhm, Buffalo, N.Y., F. O. Geyler, manufacturer, E. M. Sergeant, chemical manager, Niagara Falls, N. Y., and J. M. A. Stillesen chemist, Niagara Falls, Ont.

A coöperative furniture factory will be established at Guelph, Ont., capitalized for $10,000 in $10 shares. The first claim on earnings will be 6 per cent. interest on the capital, after which all profits will be divided equally, half to go to form a rest fund and the other half to the employees. The city will allow the use of an old factory building and machinery at a low rental.

The Canada Keg and Barrel Company will locate their factory in Orillia, Ont., occupying five acres. The company will erect four buildings, two of which will be 190 x 80 feet, one 80 x 60 and an office building. They will employ from 80 to 100 hands at the start. Plans for the buildings are complete and tenders are to be asked at once. The company expect to break ground for the building within ten days.

The Colonial Wood Products Company, of Thorold, Ont., in which a number of Toronto capitalists are interested, have had plans drawn for the enlargement of the present wood pulp plant to increase the output about 25 per cent. of the present production. New additions will be erected next spring, modern machinery will be installed and the mill will be made one of the most modern in the Niagara peninsula. Henry J. Eshelman, Toronto, one of the youngest managers in the business, has been in charge of the mill since it was taken over by the Colonial Company, and he has shown his ability by increasing the output and securing a large number of orders.

Eastern Canada

The McQuin Lumber Co., Ltd., Sussex, N.B., are applying for a charter.

Allard & Co., manufacturers of sash and doors, Montreal, Que., are stated to have dissolved.

The William Richards Company are operating a large new temporary mill on the International Railway some miles from Campbellton, N.B., this winter.

The Gambo Lumber Company, of Newfoundland, have purchased another limit of 40 square miles, about 50 miles from their present property, and have applied for an increase in their capital stock. The new property is regarded as a holding proposition. Operations on the limits near Middlebrook are being increased this season.

Two timber berths were sold at the Crown Land Office, Fredericton, recently. One lot at the head of Little River, York Co., was bid in by the applicants, Messrs. Geo. A. Bangs and George Pond, at the upset price. The other, situated on Whalen's Brook, a branch of Cain's River, was bid in at $53 per mile, or $33 in advance of the upset price, by Mr. J. Alfred Lawlor of Fredericton.

The cutting of pulpwood from private lands in the Island of Anticosti will be considerably increased this winter, as a result of the recent legislation preventing the export of pulpwood cut from Crown Lands. There are from five to six hundred men in the woods this winter cutting pulpwood, and the Island is expected to furnish 300,000 cords for export. It is also believed that this amount can be exported annually.

The Nova Scotia Car Works, Limited, of Halifax, have secured from the city council all the special privileges which they asked. These include exemption from taxation for a period of 20 years, a civic loan of $125,000, at 4 per cent., and five million gallons of water per annum free of charge, with the right to take whatever quantity of water they need in excess of this amount, at the city's minimum rate. The company which is the successor of the Silliker Car Company, has orders on hand for 1,750 box cars. An extension of the plant will be made at once so as to enable the company to keep up with their orders.

A large timber deal was completed at Sherbrooke, Que., recently when the Brompton Pulp and Paper Company took over the timber limits of Mr. T. M. Craig in the townships of Whitton and Winslow, and also his saw-mill at Reedsville. The limits extend to about five thousand acres, and are splendidly wooded land. While the purchase price has not been given out, it is understood that it amounts to considerable over $60,000. The Brompton Pulp and Paper Company have also acquired the limits of the Emberton Lumber Company, along the Salmon River. These extend to between 2,500 and 3,000 acres. The purchase price has not been given out.

Western Canada

In the recent destruction of the Rat Portage Lumber Company's plant at Norwood, Man., 300,000 feet of lumber were destroyed. Mr. D. C. Cameron, president of the company, announces that the mill will be rebuilt at once.

The Coast Lumber Company, one of the new industries recently established in St. Boniface, Man., have started work on their $5,000 shed and office building on the bank of the Red river between the G. T. P. bridge and Tache street, the lumber shed covering 200 by 120 feet of floor space.

The British Columbia Gazette gives notice of the incorporation of the following companies: Columbia Paper Company, Limited, capital, $75,000; Columbia Valley Timber Company, Limited, capital, $100,000; Fort George Timber and Transportation Company, Limited, capital, $200,000; Crown Timber and Trading Company, Limited.

The plant of the Salmon River Lumber Company in Langley municipality, B.C., has been purchased by the Western Lumber Company, of Vancouver, for $60,000. The purchasers have already taken charge and it is their intention to continue to operate the mill. It is situated at Salmon River, a short distance from the Chilliwack line of the B. C. E. R., and has been in operation for about six months. There are also about six hundred acres of timber with the purchase of the plant.

Operations are to be resumed shortly at the pulp mill of the Swanson Bay Forests, Wood Pulp and Lumber Mills, Limited, which are located at Swanson Bay, about 400 miles up the coast from Vancouver, B.C. The company was recently reorganized under the above name with capital of $3,000,000. Improvements to the plant are now being completed and an additional $100,000 is being expended in remodelling the company's sawmill. The new sawmill plant will consist of a band mill and a resaw as well as other machinery, and will have a capacity of over 80,000 feet per day.

A new lumber mill with a capacity of 25,000 feet per day is in operation at Tyee Siding on the Esquimalt & Nanaimo Railway, known as the Tyee-Sidney Lumber Mill, owned by the Vancouver Island Mining and Development Company, of Victoria. The principal part of the mill machinery was supplied by the Schaake Machine Works, of New Westminster. The company own a large acreage of timber adjoining their mill, and have from all appearances some of the finest timber in the country. Mr. R. S. Henderson is the manager of the mill, while Mr. E. J. Hearn represents the company in Victoria.

The Western Lumber and Shingle Company, with head office in Vancouver, have purchased the lumber mill and limits of the Salmon River Lumber Company in the municipality of Langley, B.C. The price reported is in the neighborhood of $60,000. It is the intention of the company to continue to operate the mill, and they may also erect a shingle mill and dry kiln at the same place. The mill was completed and placed in operation about six months ago. Its output is about 25,000 feet per day. The company have between 500 and 600 acres of timber limits adjacent to the mill. The timber is a good quality of cedar and fir. The new owners also operate mills at Mission City and Vancouver.

The machinery for the Powell River Paper Company has reached Powell River, B.C., and is being installed. It is expected that the company will be in shape to commence operations in May. When completed the plant will employ from 1,250 to 1,500 men. The mill is to have a capacity of 100 tons of news print and 135 tons of wood pulp per day. Contracts for the output of the mill have been made for a long time ahead, and 25 per cent. of it will be taken by the domestic markets. The balance will be sold in the United States. The ground wood and chemical pulp will be sold to foreign paper manufacturers for making expensive grades of paper. The company have a water power capable of developing 65,000 horse-power. They also own 212 square miles of pulpwood limits.

The Finger Lumber Company, Limited, is the name of a company recently organized by Herman Finger, formerly manager of the Pigeon River Lumber Company, Port Arthur, Ontario. Associated with Mr. Finger are the officials of the Menasha Wooden Ware Company, Menasha, Wis., who have heavy timber holdings near The Pas, Saskatchewan, where the new concern will operate. The mill will be modern in all respects, the main building being 64 x 208 feet and to contain two iron frame circular rigs, a 48 x 20-inch heavy belt gang, a large edger and an overhead trimmer pneumatically operated. All carriages will be steel and equipped with steam set works. The power house will be fireproof, the prime mover being one 24 x 48-inch Corliss engine; a twin engine driving the heavy gang. Five 72-inch x 18-foot boilers with steel casing setting will furnish steam. The contract for the complete equipment for the Finger Lumber Company's mill has been let to the Giddings & Lewis Manufacturing Company, Fond du Lac, Wis., and the mill will be in operation next spring.

Trade Enquiries

The Dominion Government Trade and Commerce reports contain the following trade enquiries. Readers of the "Canada Lumberman" may obtain the names of enquirers by writing us, enclosing stamped envelope, and stating number of enquiry.

1834. **Paper board.**—A Yorkshire firm makes inquiry for the names of Canadian manufacturers of paper board.

1922. **Oak logs.**—A Manchester firm wishes to correspond with Canadian exporters of oak logs.

1923. **Spruce deals.**—A Lancashire firm asks for prices and dimensions of spruce deals from Canadian shippers.

1926. **Spruce deals.**—A Liverpool firm asks for dimensions and prices of spruce deals from Canadian exporters.

1928. **Box boards.**—A Manchester firm asks for dimensions and prices of box boards from Canadian manufacturers.

1929. **Spruce deals.**—A Manchester firm asks for prices and dimensions of spruce deals from Canadian exporters.

1931. **Spruce deals.**—A Lancashire firm asks for prices and dimensions of spruce deals from Canadian exporters.

1932. **Yellow pine sidings.**—A Manchester firm asksk for prices of yellow pine sidings, first quality, from Canadian exporters.

1936. **Wood pulp boards.**—A Manchester firm asks for prices and samples of wood pulp boards from Canadian manufacturers.

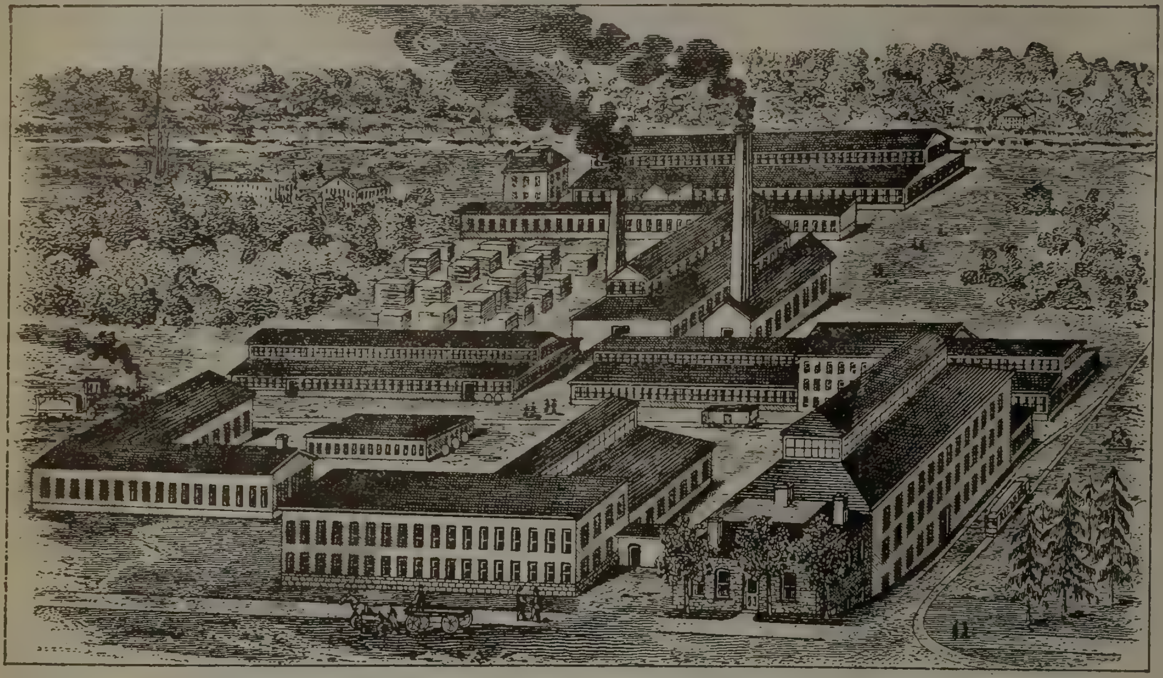
MAPLE LEAF SAWS

The Improved Racer Cross Cut Saw, by Actual Test, is the Fastest and Easiest Cutting Saw Made

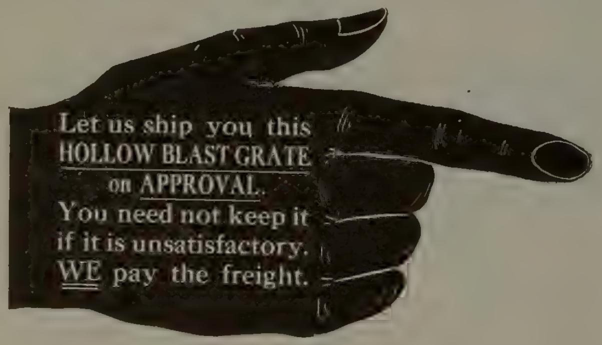


The Maple Leaf saw is higher priced than the ordinary saw because it costs more to make it. It is made of the very highest quality of steel and tempered by a secret process which toughens and refines the steel. The Maple Leaf trade mark on the saw means that it is the equal, if not superior to any saw made. It also means that you are privileged to test it against any other make and if not found equal or superior in quality you can return it and have your money refunded.

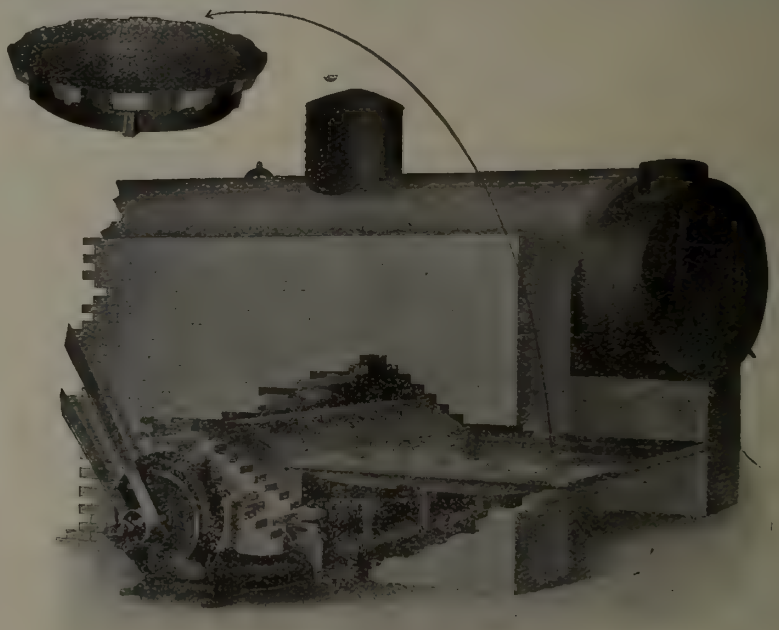
The ambition of the manufacturers of the Maple Leaf Saws has always been to produce the best tempered saw in the world and they are constantly investigating and experimenting with this end in view. They have recently made some valuable discoveries in evenness of temper. It has always been difficult to get a perfectly even temper on long and thin sheets of steel, such as saws are made of. Our recent discoveries make this an absolute certainty. Every user of saws should bear in mind that the temper of the saw is its most valuable quality. High finish and attractive appearance amount to nothing if the temper is not right.

All Maple Leaf Saws are Guaranteed to be Perfect in Temper

Shurly-Dietrich Co., Limited Galt, Ontario



Let us ship you this
HOLLOW BLAST GRATE
on APPROVAL.
You need not keep it
if it is unsatisfactory.
WE pay the freight.



What the Gordon Hollow Blast Grate will do

It will burn wet or green sawdust, bark, chips, blocks, slabs, edgings, etc., the fact that they are mixed or coated with snow and ice making but little difference.

It will develop every ounce of power a boiler is capable of generating. It usually adds from 25 to 50% to its efficiency. It will save labor in firing. With proper care, it will last as long as the mill.

Our Liberal Proposition

We will ship any responsible party an outfit with the understanding that he may **Test it for thirty days in any manner he may see fit,** and that, if he concludes he does not care to keep it, and notifies us that it is subject to our order, **we** will pay the freight **both ways.**

The thirty-day trial period is counted from date of installation.

The Gordon Hollow Blast Grate can be used in plain furnaces or Dutch ovens, and with any number of boilers, from one up. Calls for no change in construction. Easy to install and operate. Does not throw sparks. Can be fired on without running the blower, if desired. This is often necessary at night.

We also manufacture

The Celebrated "Tower" Line of Edgers and Trimmers

Consisting of 72 standard sizes and styles of edgers and 10 standard sizes of trimmers. This enables you to select a machine perfectly adapted to your requirements, whatever they may be.

Gordon Hollow Blast Grate Co., - Greenville, Michigan

For Matching Hard, Cross-Grained and Knotty Lumber

The Shimer Cutter Head

is the only Tool you can rely upon

It has strength, durability and correct working principles. It feeds faster, works smoother, cuts true to pattern. No fitting, no trying—no filing to shape. You sharpen the Cutters with a file and set them with a guage—plain as day.

Everybody profits by their use. For Flooring, Ceiling, Siding. For Ship Lap, Jointing, Double Ceiling. For Doors, Sash and Special Designs. Coping Heads to match.

SEE THAT YOU GET THE GENUINE

Look for the NAME and TRADE MARK "The Shimer Cutter Head" stamped on every Head we turn out. A dealer who would sell you an imitation means to deceive you —send them back and demand the genuine article with our guarantee for your protection.

MANUFACTURERS OF QUALITY LUMBER AND SHINGLES

There's No Need to Argue

When You Have Stock That Speaks for Itself

"Quality Stocks" are the easiest and most profitable to sell—give the best service and the most satisfaction after being sold.

The man or concern working for a good name, satisfactory business, and fair profits handles "Quality Stocks." They speak for themselves and are their own best advertisement.

If you value the welfare of your business handle the lumber with a reputation.

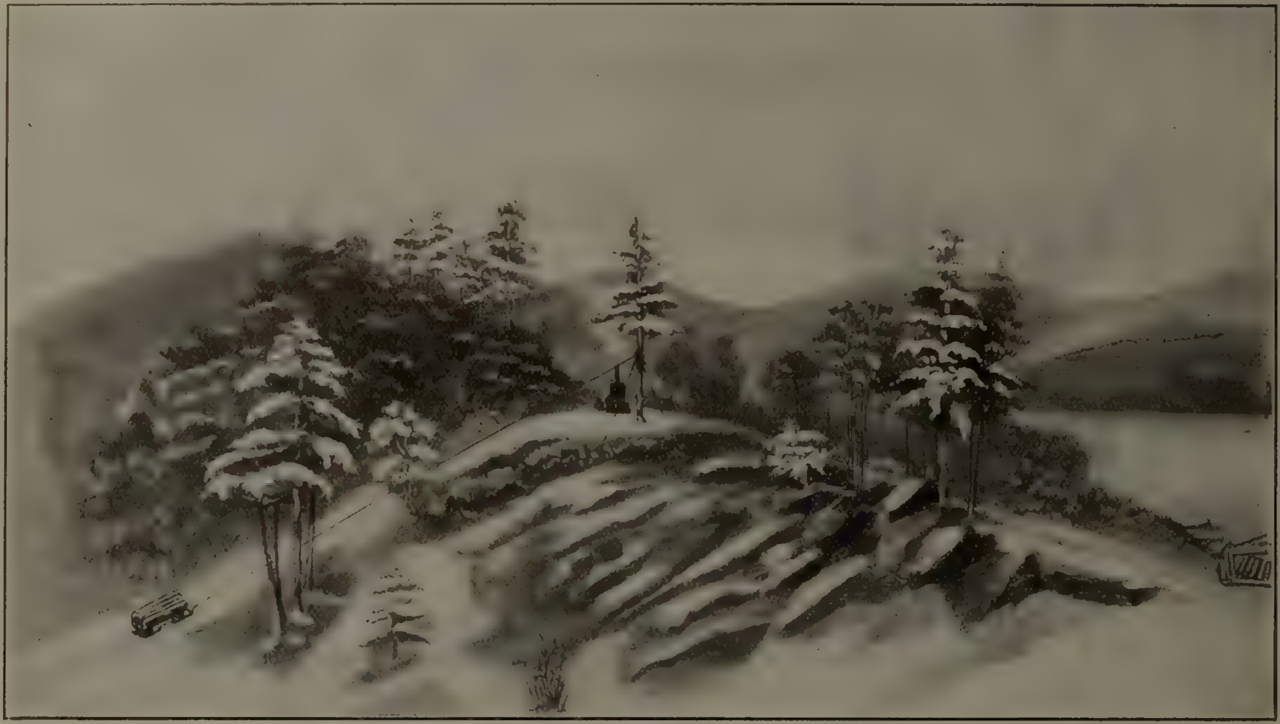
"QUALITY IS THE BEST POLICY"

Largest and Best Assorted Stock of Dry Spruce in Canada

The Lidgerwood Patent



Hauling Loaded Sleds over a Ridge

SLEIGH HOIST

A machine designed to hoist or lower sleighs loaded with logs, pulpwood, bark or other forest products, in mountain or hilly logging.

It handles steadily and under perfect control the largest sleigh loads, on any hill, **no matter how steep,** and up to 3,500 ft. in distance.

Maiming and killing of horses on steep hills is eliminated.

It does what horses cannot do. The hardest uphill haul costs no more than hauling on the level with horses.

It enables timber to be brought over heights of land, thus frequently saving long hauls; the improving of small streams; or the absolute loss of stumpage.

It pulls itself about in the woods; uses wood for fuel; and is simple to operate.

We will examine your conditions and tell you what can be done, free of charge of any nature.

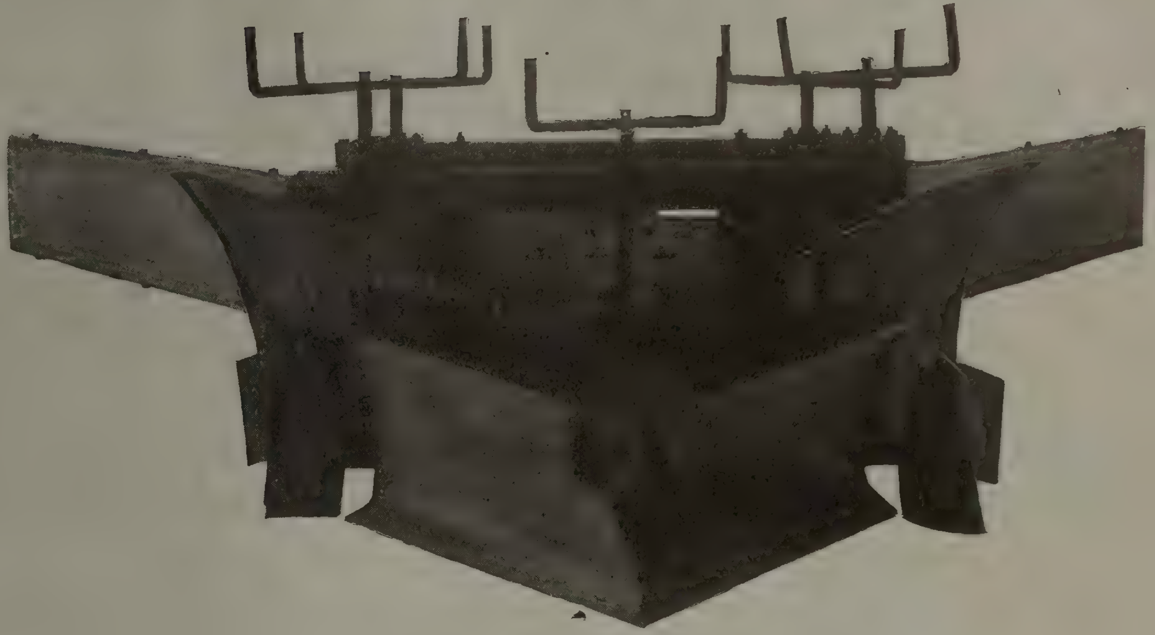
WRITE US FOR FURTHER INFORMATION

Allis-Chalmers-Bullock, Limited

Manufacturing Agents for Lidgerwood Mfg. Co., New York, N. Y.

Montreal, P. Q. Vancouver, B. C.

SNOW PLOWS



A careful examination of the above illustration will demonstrate to you what a complete and practical snow plow this is.

Important Points.

Rutter attachment for cutting into the ice to make track for the sleigh.

Nose Piece is cast with steel points and may be raised and lowered by screws shown in illustration.

Wings of hardwood on back may be set to shove the snow back 7 feet on each side of the road.

Weight about 1,800 pounds.

We have sold over 75 of these Snow Plows

Send us your enquiries.

MOWRY & SONS **Gravenhurst**

Isn't it Better to Investigate

"The HOWARD" Vulcanizing Process

than to wish you had

Positively the quickest and most economical system known for Drying and Preserving Lumber, Railroad Ties, etc.

POINTS IN ITS FAVOR:

Does away with all kilns
Improves quality of all lumber
Increases the crushing strength
Increases the transverse strength
Reduces the weight 30 per cent to 45 per cent
It materially prolongs the life of wood
Eliminates shrinking, swelling and warping
Emphasizes and beautifies natural grain of the wood
Makes fit for commercial use woods not otherwise merchantable
Does away with necessity of maintaining heavy stock of lumber in yards
By this process green lumber taken from the log can be used for building purposes in 2 or 3 days

We invite Lumbermen and Owners of Woodworking establishments to see a practical demonstration of the process at our plant in Toronto

When you want

Leather

We are the people

Ask for the

Round Knife Brand of Harness Leather

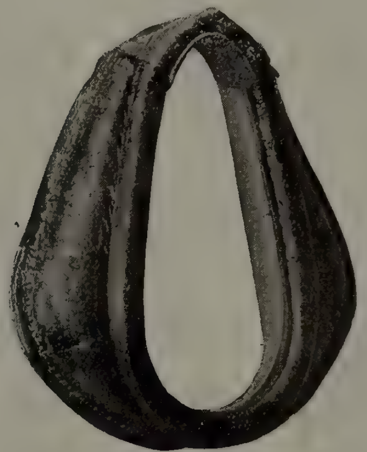
ROUND KNIFE BRAND

Leather of quality bears this stamp. It has no equal.

Lace Leather

"B. B. Lace"

In sides or cut into laces any width required. It has stood the severest test—strong,—pliable and durable. We tan and finish it ourselves and stand behind it.



Our Lumber Horse Collars

Are made on scientific lines to fit the horse. May be had with the Gall Cure Curled Hair Pad when required.

We make all kinds of horse collars, short or long straw.

If you want satisfaction get our make. Handled by all reliable dealers.

If they don't supply them send to us direct.

Oil Tanned Mocassins and Sporting Boots

We surpass all other makes on the market.

Style No. 407

WHY?

Because every pair is made with our Patent Heel which insures against running over and ripping at the heel like other makes.

It acts like the stiffener in your boot but is easy and pliable and has no rough seams to hurt the foot.

All well made and of leather of our own tannage.

Frame has no vibration from Countershaft
Cutter Head Spindles of large diameter
Combines all good points of an inside and outside Moulder

Canada Machinery Corporation Limited, - Galt, Ontario

The Troublesome Feature on most Triple Drum Sanders is THE "OSCILLATOR"

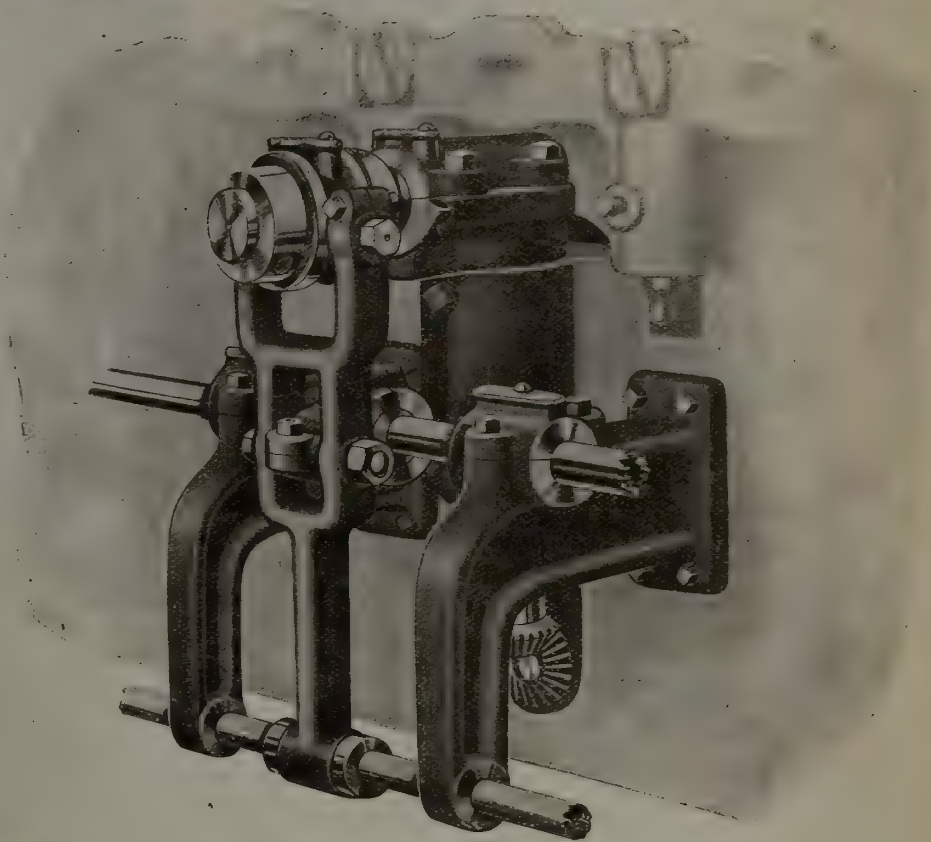
Such is not the case with our

New No. 225 Triple Drum Sander

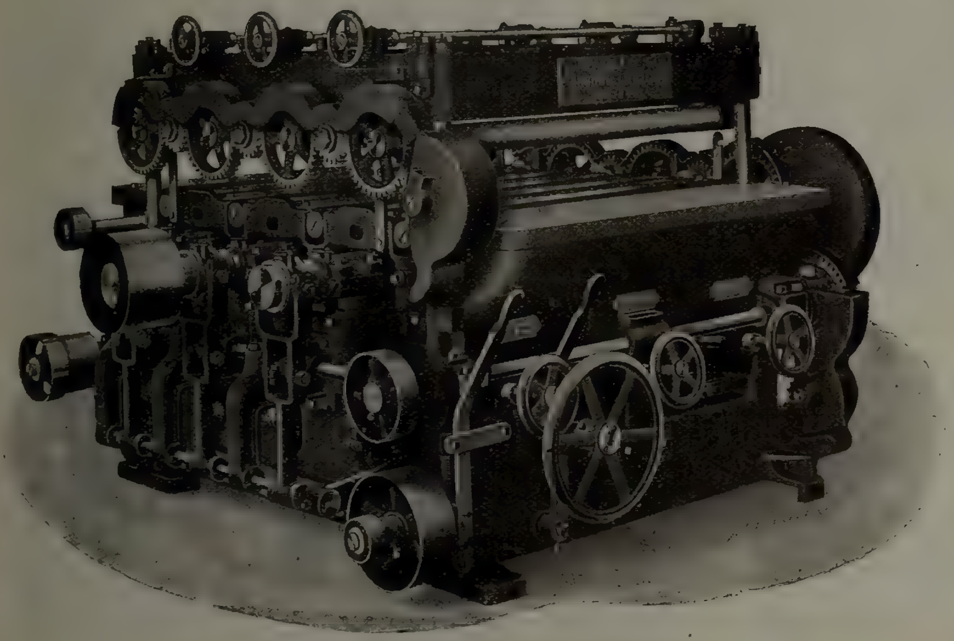
This machine is made exactly with the end in view of overcoming trouble with the oscillator. We have accomplished this by our improved method of eliminating wear in the oscillator bearings—these bearings cannot wear as the shaft does not touch their walls —then, again, they are relieved of all weight by pivoting the oscillators to a rigid shaft, shown in the sectional view.

This feature is not found on other makes and contributes largely to the success of our

New No. 225 Triple Drum Sander



The Oscillator



No. 225 Triple Drum Sander

Our New Catalog

on Sanders illustrates this feature of the No. 225 and other salient points on our machine. It also deals with sanders generally—all kinds of sanders. You ought to have a copy—Free

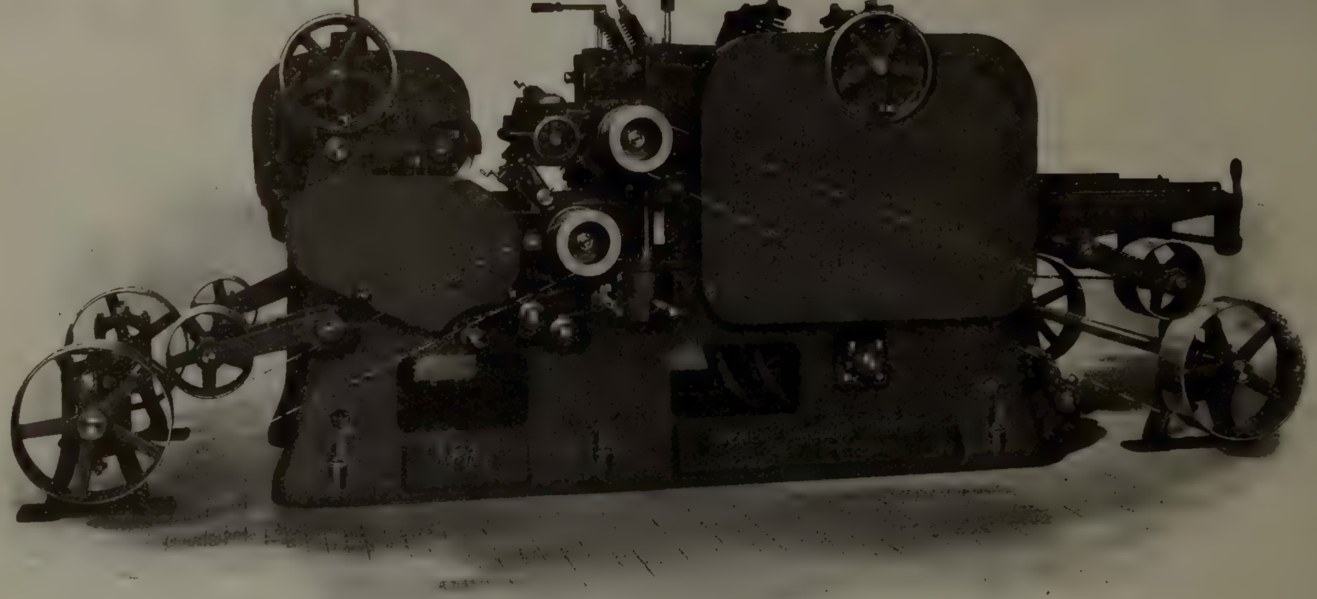
"Berlin" Surfacers



Berlin Surfacers are built for the use of thin knives. A few years ago the significance of such a statement would hardly have been appreciated. To-day, the man who turns out the most lumber in the shortest time, who gets the most from his lumber and his machines, who gets the finest finish, is the man who uses thin knives.

Pyts Steel, used exclusively on Berlin machines, is the one self-hardening steel made to-day which possesses the requisite toughness combined with the right amount of hardness, for the successful use of thin knives.

Thin knives are set at a greater angle than the ordinary thick knives, consequently more of a "scrape" is secured. This is further effected by back-bevelling to suit the nature of the wood being worked.

With Berlin thin knife heads, devices are used which grind the knives without disturbing the setting. The heads are then set in motion and jointed or brought to a perfect cutting circle so that each knife does its share of the work.

Thin knives actually make better work possible and will raise the grade from ten to twenty per cent.

The No. 186 is a fast feed matcher with the side-head spindles left out. It is also short-coupled and has six large feed rolls. Belt tighteners are provided for both top and bottom heads—no chance to "stall" them no matter how heavy the cut.

The No. 186 has the capacity of four ordinary surfacers and will produce a finish at 150 feet per minute that cannot be equalled short of a cabinet surfacer at 30 feet per minute. It is built in two sizes—20 in. or 30 in. wide with a 6 in. opening.

The top and bottom heads are very close together—warped and crooked stock can be better and more easily surfaced.

This surfacer gives the satisfaction which prompts the purchase of other Berlin machines.

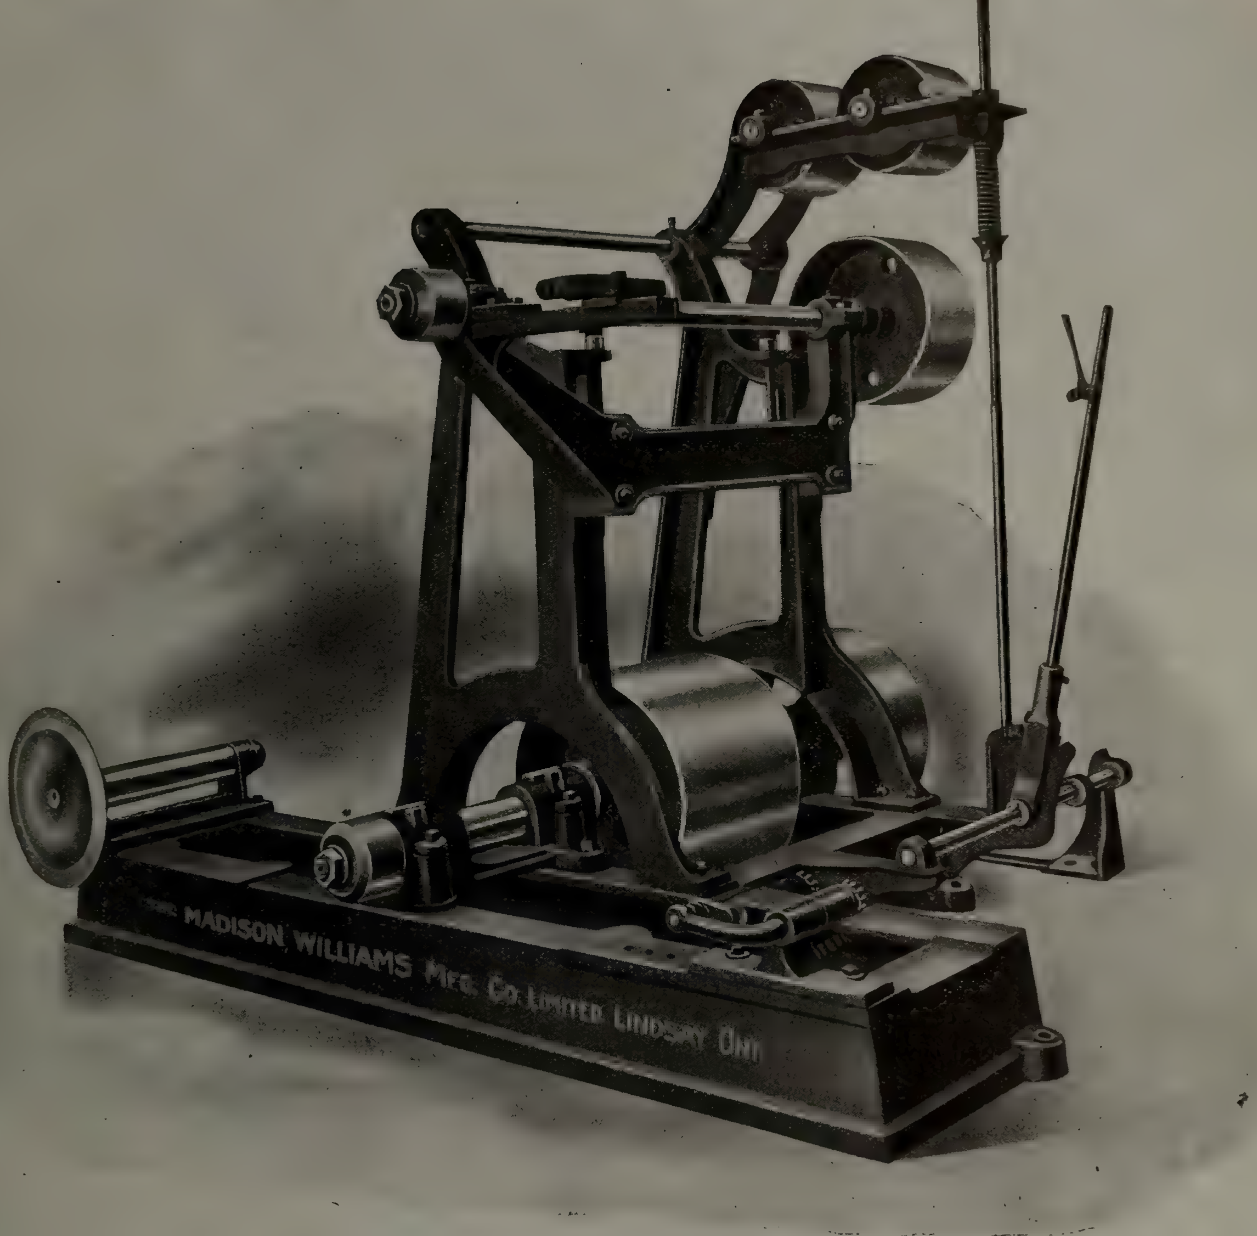
SAW FRAME



MADISON WILLIAMS MFG. CO. LIMITED LINDSAY ONT.

No. 4 Iron Saw Frame and Top Saw

The Husk or Saw Frame is box pattern, heavy and substantial, the end projection for lumber roller and saw guide being cast solid therewith. The Saw Arbor is hammered steel 3 7-8 in. diameter, which is supported in three wide babbitt bearings. The two bearings near the saw are connected, the lower half of each box and the connecting web being cast in one piece for the double purpose of convenience in adjusting and providing a rigid and effective means for holding and taking up the end play of the mandrel. This end play of mandrel is taken up or regulated at the middle of the mandrel, by a set collar on one side of the hub of pulley on the other. The standard size drive pulley is 26 in. diameter, 16 in. face, but frame will take in a pulley as large as 30 in. diameter, 25 in. face. The Rear Lumber Roller is furnished with steel revolving spreader.

A Guernsey Saw Guide is supplied with this frame which is constructed in such a manner that the outside arm can be instantly turned up or back so as to allow the removal of the saw from the Arbor without the trouble of removing the outside arm of the guide from the standard or changing the position of the guide upon the frame. The arms, which are made of steel, are moved independently of each other by hand wheels, and even when the saw is in full motion can be adjusted without the use of a wrench and without danger of accident to the sawyer. Largest size saw that can be used 72 in. Weight 2500 lbs. Floor space 7 ft. x 8 ft. 6 in.

The Top Saw Frame is made very heavy and is securely bolted to the saw frame. THE MANDREL which is 2 7-16 in. diameter, hammered steel, is carried in one casting containing two wide babbitt bearings. This casting is machined and fitted to uprights, and is raised or lowered by means of hand wheels and screws. THE TIGHTENER FRAME, carrying two pulleys 12 in. diameter, 9 in. face, is operated by lever, and the arrangement is such as will allow the top saw to be stopped or started at will, or the tension of the belt increased. These tighteners give the saw a reverse motion. Size of Mandrel Pulley 18 in. diameter, 9 in. face. The top saw frame can be adjusted to carry 72 in. saw on lower mandrel and 36 in. on upper, or 40 in. saw on lower and 24 on upper. Weight 1800 lbs.

NO. 120 MACHINE FOR 10 IN. BAND SAWS.

SAW MACHINERY

The Most Efficient Band Saw Sharpener Made

Equipped with **new automatic idler** bracket keeping the belt to the emery wheel at the same tension as it travels up and down. Idler pulley is located on slack side of the belt and can be adjusted in line with the emery wheel. Belt is held to same tension at all times by a large spring. There are **no flange pulleys** used on this machine, with the use of automatic idler the life of the belts is prolonged. **Head** is constructed with 60 degree angle shaped slides on both sides so that **wear can be taken up by adjusting one gib.** Every wheel arbor can be adjusted so that a straight wheel will do the same work as a concaved one. Head is adjusted to a 45 degree hook.

Saw rest is moved up and down by hand wheel at the right hand side of the machine, convenient for the operator. Adjusting screw is so placed that it **cannot become covered with emery dust.** The saw rest is made of self hardening steel and can be easily replaced. **Back feed** is of a new design and is strong, simple and effective. The adjustable eccentric cam on the cam shaft is connected to the long back feed shaft by means of a lever, this lever rocks the back feed shaft that moves the back feed arm. Back feed finger can be turned out of the way and allow saw to be lifted up without interfering, machine is equipped with an **adjustable cam.**

To those interested in the highest type of machinery of this kind we invite your inquiries and ask permission to send detail description.

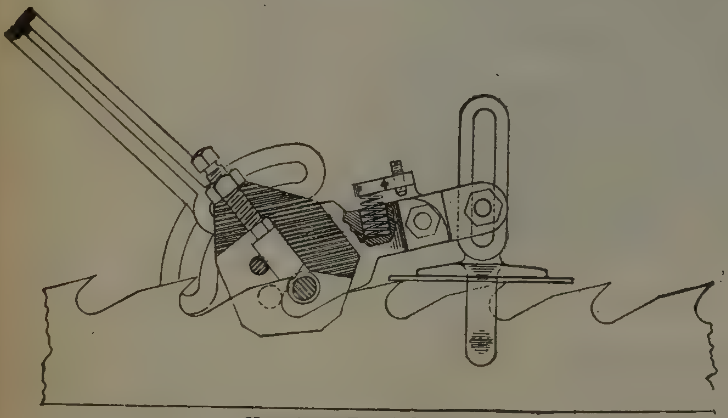
Filers! Millmen!



Hanchett Band Swage

Success in lumbering depends upon the extra large cuts over the regular cuts, and turning out better lumber. In other words it is turning out more lumber at a less cost. Now, our specialty is labor saving machinery for the care of saws. We manufacture all kinds of machinery and tools for the care of saws. One of our best tools is our Hanchett Swage. This tool presses the tooth widest on face, widest at extreme corners, and tapers the tooth downward and backward. Our swage shaper then presses the tooth to an ideal shape and each tooth exactly alike thus doing away with a great deal of filing and making a stronger and better cutting tooth.

Hanchett Swage Works

Send for Catalogue No. 6 **Big Rapids, Mich., U. S. A.**

Steel Carriages

Check over the list below—

How nearly does the Waterous Steel Carriage, 1911 model, measure up with your idea of a perfect Saw Carriage?

Frame—The Frame is built to eliminate spring. Stringers and cross girts are of 8in. x 6in. selected oak throughout; are tenoned and mortised together and firmly braced with through going tie rods and substantial corner brackets. Iron banding on upper edges prevents wear. This Frame will stand up under the severest kind of service.

Running Gear—Double axles under each logseat. Axles, wheels and boxes of steel. Bearing surfaces everywhere much larger than is the usual practice. Lug and Bolt take-up on boxes provides means for quick re-alignment in case of wear.

Head Blocks—Cast of toughest steel throughout. Log seats are of girder section, with wide nigger nose, braced internally and fitted with machine steel facing plates reversible when worn. Extra wide planed bearings on stringer and deep dip lugs which grip the frame, make shifting impossible. Knees are high and of new design, are faced with machine steel plates, carry lubricating boxes for knee slide, and are provided with nigger hook and with spring cushioned self-aligning 6 in. taper movement.

Dogs—Waterous inserted tooth dog, the latest and most common-sense dog on the market. Damaged teeth can be withdrawn and replaced without disturbing the dog in the knee. The new dog is designed to swing to draw the log against the knee tightly and firmly. Small logs, large logs, and cants of all dimensions, handled equally well.

Set Works—Our No. 4 Combination Set Works. A Setter and Receder in one machine. Operated by only two levers. **Absolutely no lost motion.** We can prove this. New form of pawl. All operating parts of steel or wrought iron. The strongest, quickest acting, most exact Setworks yet produced. Can be operated with Steam Setter or be replaced with Trout Power Setworks.

These Carriages are built with knee opening of 36 in., 42 in., 50 in., 60 in. and 72 in. Can be supplied of any length and with any number or spacing of Headblocks. Designed for rope or steam feed.

The
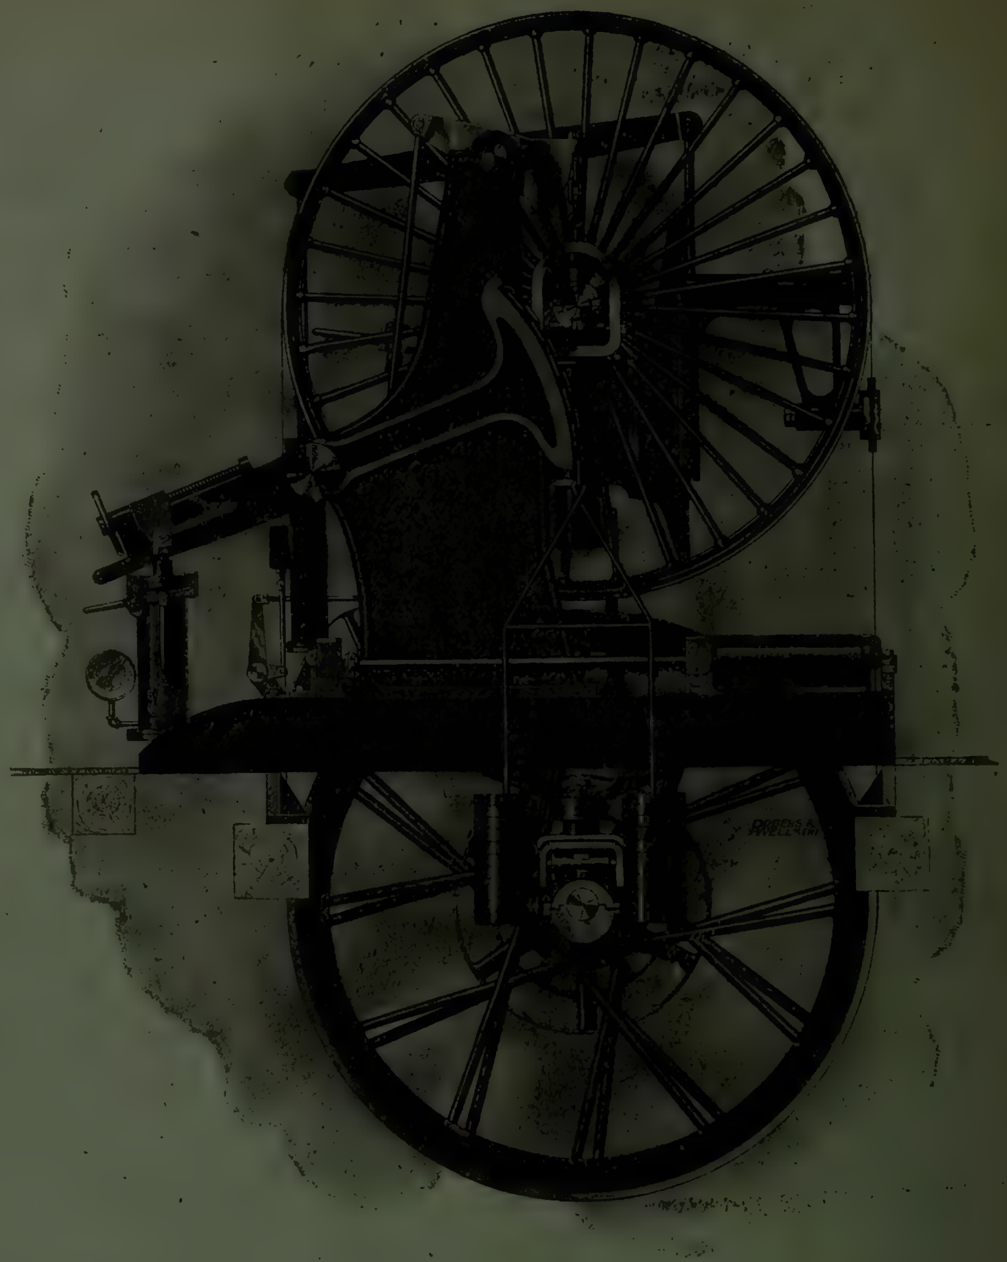
Steam Tension
Band Mill



is made with 8 foot, 9 foot and 10 foot wheels. As you know, the top wheel and upper guide are operated by separate steam cylinders.

Some obvious advantages of this are, the great speed with which the guide can be raised and lowered, the extremely sensitive tension on the saw, and the quick time with which saws can be changed.

You will see at once that considerable time is saved in one day, over the usual weight tension mill.

And no tensioning system has yet been made, that is as sensitive as our steam tension; so that your saw is more easily kept in perfect shape and at the right tension at all times — which means better lumber.

Any mill which will increase your cut, and probably improve its quality is worth your while looking into; and besides, there are other special features which increase its value to you.

Shall we send our catalogue?

440 Square Miles Timber Limits

on Georgian Bay

To be Sold by Private Sale in Large or Small Blocks.

On account of their President and Principal shareholders being engaged in other large enterprises, and not having the time to give to them all, THE PARRY SOUND LUMBER COMPANY, Limited, offer for Sale all of the timber lands, mills and town property situated in the Town of Parry Sound; also Tug Scow and full Camp Equipment for five camps, including boom chains, snow plows, sleighs, etc.

THE LIMITS TO BE SOLD

comprise some 440 square miles of licensed and deeded Pine, Hemlock, Spruce, Birch and other timber. The licenses from the Ontario Government include all timbers and are not restricted for time. Government dues are as follows: Saw Logs, White Pine, $1.50 per M. ft., B.M. Saw Logs, Hemlock, Tamarac and other woods, 75c. per M. ft. The timber is situated in the Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street. The Canadian Pacific, Canadian Northern and Grand Trunk Railways run through the limits, which makes some of the parcels offered for sale particularly desirable for small mill owners.

A circular giving full information, maps, terms and conditions of sale will be furnished upon application to

The Parry Sound Lumber Co., Limited
1315-20 Traders Bank Building, TORONTO, CANADA

The patronage of Canadian consumers of Hardwood is most earnestly desired and respectfully solicited.

With our several mills and large stumpage holdings we are in position to produce good high grade stock, while our location is such that we can render exceptionally prompt service, and the favorable freight rates enable us to give splendid values.

Send us your enquiries and give us a trial.

Dry Lumber

***Like* you want it ~ *When* you want it ~**

Read this Letter

Woodstock, Ont., Nov. 10, 1910

Grand Rapids Veneer Works,
Grand Rapids, Mich.

Gentlemen :—

In reply to yours of the 2nd inst. would say that your Dry Kiln System has been very satisfactory to us. We have had no difficulty in drying perfectly any kind of material we use except rims. It will dry the material all right but the steam straightens them out. It is the only system in our experience that will dry gum box boards without warping. When we put in additional kilns it certainly will be your system.

Yours truly,
THE BAIN WAGON CO. LIMITED
(Signed) John A. Bain,
Vice-Prest. & Mngr.

We have letters from many more Canadian Factories and Mills, which we will send you on request. They will tell you how to

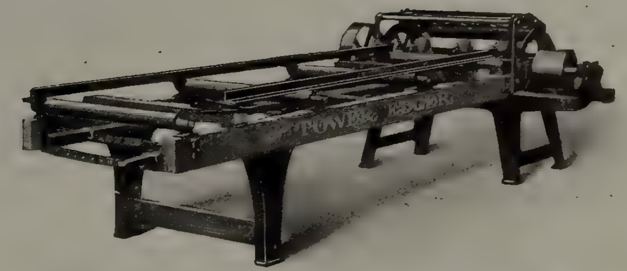
This is the celebrated TOWER 32-inch Edger, for portable or small stationary mills from 15 H.P. up, cutting up to 20,000 feet in ten hours.



Front and main pulley side, No 4 Tower 32-inch Edger with levers for shifting saws. Rear table not shown. Back press roll raised.

The bed of the husk is in one piece, instead of being held together with rods.
The vital parts therefore always retain their proper relative positions.
The saws may be readily removed without disturbing the arbor.
There is an outside support for the main pulley, which is very much better than to have it overhang.
The adjustable guide is by far the simplest and most accurate and reliable to be found on any machine, however expensive.
The arbor is provided with a steel featherkey for driving the saws.
The indexes are on the front end of the front table, where they are readily seen by th eoperator. This is especially important on dark days or where the edger stands in a dark part of the mill.
The indexes are adjustable, to adapt the machine to cut scant, exact or plump, according to the requirements of the trade.
Each table is ten feet long, and is provided with iron cross girths and legs.
Every part of the machine is made to template, which insures a perfect fit and perfect adjustment.
Every piece of the machine is also lettered and numbered, which makes it easy to obtain repairs in case of fire or other accident.
Notice that these edgers contain many features usually found only in large and high priced machines.
We also make larger and heavier edgers, our line comprising seventy-two standard sizes and styles. We build them all with either levers or hand wheels to shift the saws.

You Should Have a

Simonds Saw

In Your Mill

Every Saw or Planing Mill man in Canada who is looking for the greatest Saw value for his money should be able to say he has a Simonds Saw in his mill or factory.

Made of Simonds Steel in Montreal

Here are two facts of vital importance in Saw Making. In the first place Simonds Steel is especially made for Saws. By using these plates we are enabled to get teeth that will hold their cutting points against hard usage for a surprisingly long time, thus saving the expense of keeping the Saws up and enabling the millman to get more service.

Secondly, Simonds Saws made in Montreal are made in the same way by expert Saw Makers, as are the Simonds Saws made in the United States by the Simonds Manufacturing Company. This, in itself is a guarantee to every user of these Saws. If you are buying a Saw now we would like to have you make it a Simonds Saw. Write our nearest branch office for full particulars.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 31 Toronto, January 15, 1911 No. 2.

New Headquarters of the Canada Lumberman at 220 King Street West, Toronto

Canada Lumberman in New Home

For the past eighteen years the Toronto offices of the Canada Lumberman have been located in the Confederation Life Building. From time to time additional accommodation was secured to meet the growth of the business. This being no longer possible, we have now removed to the new building illustrated above at 220 King street west, where a most cordial welcome will be extended to our friends and everyone interested in the lumbering and woodworking industry and trade. May the reader consider this a personal invitation to visit us in our new home.

With the greater facilities and better equipment of our new building, coupled with an efficient organization, the Canada Lumberman will not only maintain its present strong position, but will forge ahead to a much higher standard of efficiency and usefulness. Watch its development during 1911!

Carlot Siding Rule Postponed

The Canadian railway companies have notified the Canadian Manufacturers' Association that they have decided to postpone the order issued by them some time ago regarding the loading of car lot freight on industrial sidings until July, 1911. In October last, the railways sent out circulars to all agents and manufacturers notifying them that after the first of the year nothing less than a carload lot would be permitted at industrial manufacturers' sidings. A protest was made against this, through the Canadian Manufacturers' Association, Mr. J. E. Walsh, of the Transportation Department, pointing out that it would not only entail great inconvenience to the shipper, but actual loss both to the railways and the manufacturers. It is to be hoped that, after they have had another six months to study the situation, the railway companies will realize that the action which they are contemplating would be not only a heavy burden upon industry, but an assumption of a right which does not belong to them. If the order is finally put into force it will mean that companies which have less than carload lots to ship will be deprived of the advantage of having private sidings. They will be obliged to take their freight to one of the public freight depots of the companies to be loaded by them into cars. It is expected, however, that the abuses of the former system will be remedied by the conferences which are in progress between the railway companies and the manufacturers and that when the time for the enforcement of the new rule arrvies it will be withdrawn.

Will Regulate International Traffic

Lumber manufacturers and exporters in Canada will be interested in the negotiations which have been in progress between representatives of Canada and the United States regarding the proposed establishment of an International Railway Commission. One of the most important developments in commercial matters which have occurred of late years in Canada and the United States has been the establishment in each country of Boards of Railway Commissioners. These bodies have justified their existence many times over, not only by the saving which they have effected for the shippers of the country, but by the removal of many difficulties formerly existing, which deterred commercial development and caused ill-feeling between shippers and railways, for which there was no necessity. The railway companies also, though they looked upon the movement at first with some measure of fear, have learned that their own interests are as jealously guarded by the commissioners as are those of the shippers.

In spite of the benefits secured by these commissions, much has remained to be done, and one of the most important fields in which the commission movement can be developed is that of international trade. A vast amount of merchandise crosses the boundary line between Canada and the United States, and in the past, although regulations could be made by the commissions of either country, the absence of co-operative action on both sides of the line has frequently rendered the orders of the boards of no effect. A case in point where an international board would have been of much assistance was one in which the Rat Portage Lumber Company recently complained of the failure of the Canadian Northern Railway to supply them with sufficient cars and to give them a reasonable freight rate. The railway company replied, in regard to the freight rates, that part of the line over which the freight was hauled, was situated in the United States, and they could not regulate the freight rate thereon. If there had been a joint international board it would have been a simple matter to take the question before them and have it disposed of satisfactorily.

The negotiations for the establishing of an International Board have now been in progress for several months. The representatives of the two Governments have been Hon. J. P. Mabee, Chief Commissioner of the Board of Railway Commissioners of Canada, and Martin A. Knapp, chairman of the Interstate Commerce Commission of the United States. In their respective fields these two men have proved themselves to be exceptionally capable, and the fact that they have taken up the question is a guarantee that it will be quickly and satisfactorily solved. On December 30 they came to an agreement which means that in the course of a few months, at the outside, regulatory authority will be established over the railways which operate in both countries. The commissioners' report is now in the hands of their respective Governments, and while the substance of the reports is not yet made public it is known that it recommends the appointment of an International Board whose authority will extend over international rates both for freight and passengers. The board will also have power to prescribe through rates and joint rates, and through bills of lading, between points in the two countries. Authority will be had over all international traffic and shippers in either country will be able to appeal for relief from what they deem to be oppressive methods or regulations and excessive or unreasonable rates. The report recommends that the board should be created by a treaty be between the two countries rather than by joint legislation. It is expected that as soon as the respective governments have become familiar with the recommendations, arrangements will be made immediately for carrying them into effect.

Forest Fire Prevention Requires General Co-operation

Present indications give promise that something effective may shortly be done to prevent the careless starting of forest fires. Hon. Clifford Sifton, chairman of the Commission of Conservation, in a recent address before the Canadian Club of Ottawa, gave an outline of the legislation which the commission intends to ask the Dominion Government to pass upon the subject. The most important provision will be one making the railway companies liable to a penalty for fires started by their engines or spreading from their right-of-way, unless they can show that they have had the most approved type of spark arrester on their engines, that their employees have not been negligent in conducing to the starting of fires, and that they had a properly equipped fire-fighting staff to check the fires once they were started.

This is a rather radical proposal, and naturally enough the railway companies have shown alarm over the situation. Their fear has resulted in the appearance of an interview in the daily press in which a prominent railway official in Ottawa sought to defend the railways by making counter-charges against the lumbermen. This interview and a reply to it by Mr. Frank Hawkins, secretary of the Canadian Lumbermen's Association, are published elsewhere in this issue.

As to the charges made by the railway official in his interview, it is scarcely necessary to add anything to the excellent reply made by Mr. Hawkins. One cannot avoid regretting, however, that at the outset of this movement there should appear to be an inclination on the part of the railroads to cloud the issue, and to fasten upon others, blame which attaches to themselves. The interests of the railroads and of the lumbermen in this matter are coincident. They are, in fact, very much the same as the interests of the whole public. The railways depend upon the forests of the country for a large portion of their freight business. The lumbermen depend upon the forests entirely for their livelihood. The people of Canada depend upon the forests for the maintenance of an industry which has brought a large measure of prosperity to the country, and the destruction of which would be an incalculable loss. The Conservation Commission represent the interests of the people and ought to be assisted to their efforts to preserve the forests, by both the railways and the lumbermen. That will have the support of the lumbermen is a foregone conclusion. One would expect also that the railways would fall in line and make the work of the commission as easy as possible.

The criticism of Hon. Clifford Sifton's proposed legislation, however, is indicative of a much different attitude from one of assistance. No matter how ingenious the railroads may be in arguing that they have been doing all they can to prevent forest fires they cannot be relieved of the blame of having caused many a destructive fire. The only practical method of keeping them continually up to the mark, will be to hold them responsible for fires presumably started by them, unless they can prove their innocence.

The charge made, that the lumbermen are responsible for most of the fires, is childish. The lumbermen are dependent upon the timber for their livelihood, and they take every conceivable precaution to prevent fire. The men who work in the woods have been brought up with a wholesome appreciation of the importance of extinguishing all fires and taking every precaution to prevent them. Sometimes they are to blame, but as a body they are more of a fire-preventing factor than a cause of fire. They can be depended upon to do all that lies in their power to assist the commission in enforcing any practical regulations that are introduced.

Extension of Algonquin Park now Assured

The addition of 132 1-2 square miles to the area of Algonquin Park is a commendable sequel to the recent action of the Ontario Government in purchasing the rights of the Mann Lumber Company to cut timber in the park. That the timber of the Park should be saved was recognized to be essential to the continued usefulness of the park. With the safety of the timber assured it became the part of wisdom to arrange for including in the park as much of the headwaters of the rivers of old Ontario as could be set aside without hindering the development of the Province. The district which has thus been set aside not only contains the headwaters of the rivers but has become the source of supply of game and fur-bearing animals for a large portion of the Province. By its preservation the province is assured of a perpetual holiday land and of a splendid supply of game. As time proceeds it will probably be found possible also to cut considerable quantities of timber in order to encourage the growth of younger trees. The thinning out of the timber growth may become a considerable source of revenue to the province in years to come.

From the point of view of the public it is interesting to note the reference made to the matter in a recent issue of the Toronto Globe.

"Two thousand square miles of forest and linked waterways in the rocky highlands of Ontario set apart as a game and fish preserve and for the perpetuation of wild life in all its forms is a provincial asset that must grow in value with each succeeding generation," says the Globe. "This park is set apart as a permanent home for the wild life of Northern Ontario, a natural breeding ground for game fish, a continuous and abundant source for the important rivers taking their rise in Ontario's highlands, and, in short, an area of nature rescued from the destructive encroachment of civilization.

"The necessity of extinguishing the claims of the lumbermen and stopping their operations has long been recognized. It is often necessary for them to change the levels of the lakes and running waters by dams to float their logs. These are sometimes left in position on into the summer to retain water that may be required, and sometimes the water is held back for several successive seasons. This kills the trees by submerging their roots, and often a few feet of water extends the destruction for miles along low ravines. The dead trees fall into the water and pollute it, greatly to the injury of the finest game fish. The results are aggravated by the injury to the spawning beds and by the actual obstruction of the dams in keeping the fish out of certain sections of the rivers. Among the many injurious effects of the lumberman's dams is the frequent drowning of young beaver in their houses. The Government is dealing with the situation as it has developed through the issue of timber licenses before the need of a reserve was perceived, and this extension has been accomplished by compromises that extinguish timber claims. Superintendent Bartlett is a man who has found his work, and he looks after the great area under his jurisdiction as if it were his own estate. Under his care natural conditions are being restored. The wolves and poachers are the most persistent menace. The former must be regarded as a perpetual danger to be held in check. The human marauders will be dealt with effectually as soon as lumbering is brought to an end and strangers along the water-courses can be made to explain their presence."

Stricter Regulations to Govern Ontario Forest Rangers

The new regulations which have been issued by the Ontario Department of Lands, Forests and Mines, for the regulation of the forest raging service will be commended by all who have at heart the protection of the timber resources of the province. In the past there has been altogether too much of a belief that the position of a forest ranger was a sinecure and that it provided a cheap and pleasant means for students and others to obtain a good summer outing. If the new regulations are strictly enforced, much of this will be done away with and the service may become an effective factor in the prevention of forest fires. Investigation has clearly proved that the vast majority of forest fires are the result of carelessness, and that they could be prevented at a cost which is infinitesimal, compared with the loss caused by the destruction of valuable timber which can never be replaced.

The most important feature of the new regulations is the indication afforded that the government really intend to enforce them. Even under the old regulations, much good could have been done which was neglected. Now, however, we have a new hope that forest rangers in the future will be real forest rangers, men who can travel through the forest country rapidly and who know how to handle a fire when they come across one. A forest ranger should not be the class of man who hopes to become a good woodsman after a little experience in the woods. He should be a man who has been brought up in the woods who knows the ways of the forest as well as people in the cities know the street corners. He should understand thoroughly the methods of travel in the woods and on the rivers. An incapable man, not knowing how to take a canoe and an outfit up a difficult river, is more of a drag upon a forest ranging service than a help. The continual dangers of river travel can only be avoided by a man who has been canoeing and treking through the forests for many years. Even an experienced woodsman is continually brought face to face with difficulties which draw out his utmost exertion to prevent accident and loss of life. When to the dangers of travel are added those of forest fire fighting the necessity for men of resource and long experience becomes imperative.

All this is well known to the men who have lived in the forests, but it has only been by a long course of education that the public have been brought to an understanding of the situation. Perhaps the ignorance of the public in the past was responsible for the failure of governments to give the subject the attention which it required. This excuse is no longer available, however, as the public, through the press, have been made fully aware that there is no more important question to be solved to-day than this of the preservation of the timber resources. Beyond any question the vigorous enforcements of such regulations as the government has now promulgated, will save the province of Ontario many thousands of dollars, and the owners of licenses to cut timber in Ontario will be more willing to pay for the cost of fire ranging on their limits than they have in the past. The Ontario Government recently passed an act placing the cost of fire ranging entirely upon the owners of the limits. This was in itself a retrograde enactment and was not justifiable, as it made the limit owners responsible for the protection of the government's interests in these limits. In addition, the lumbermen felt that they ought not to be forced to pay for a service which was inefficient. They will welcome the promised improvement and will not complain a great deal, if the money they contribute to the service is spent upon securing practical results. The course of the government in this matter is the only logical result of their decision to make the lumbermen pay the entire cost of fire ranging.

Editorial Short Lengths for Busy Readers

A matter of considerable interest to lumbermen in Ontario was brought up in an atricle which recently appeared in the Toronto Globe. According to a report in that paper, the Ontario Government are seriously considering ways and means to recover cut-over lands included in timber limit licenses which were issued from 25 to 50 years ago. The situation is a delicate one to handle, as the limits in question were issued without any time limit and were in effect perpetual. The holders of these licenses have therefore an interest in them which amounts to a valuable asset in some cases and which cannot rightfully be confiscated. If the government is considering the recovery of these limits the question will naturally resolve itself into one of the value of the interests of the license holders.

Several bills have already been prepared for submission to the U. S. Congress calling for a repeal of the duty on lumber. The report of the U. S. Bureau of Corporations on the lumber industry, will also be strongly against the present system of lumber duties and will state that the lumber industry needs no protection. The report is also expected to state that the lumber business and the ownership of the timber of the country, while not a trust, is largely in the hands of a very small number of persons, who might easily control matters by joint effort. While not accepting all that the report will say about the alleged trust, the lumber trade of Canada will watch with keen interest any steps which are taken on the other side with a view to a reduction or removal of the duty on lumber.

The Ontario Government have decided to sell by tender two pulp concessions, one in the Alitibi District, and the other i nthe Rainy River District. The main object of the sale is to provide a market for the pulp wood of the settlers in these districts, who depend largely upon the sale of pulpwood to carry them through the first year of their settlement operations. The right to cut pulpwood on these concessions will carry with it the duty of erecting pulp and paper mills capable of handling the output of spruce, not only from the concessions, but also from the surrounding country.

The Abitibi Lake concession contains approximately 1,560 square miles. It is traversed by the Grand Trunk Pacific and along the western border by the Temiskaming and Northern Railway. At Iroquois Falls the government has reserved sufficient land for the mills and for a power plant. The mill and equipment at Iroquois Falls are to cost $500,000. It is to have a daily output of 100 tons of paper and to employ on the average 250 hands for ten months in each year. In addition to the bonus offered by the successful tenderer the regular dues will have to be paid, which are 40 cents per cord for spruce and 20 cents per cord for balsam, banksian or jackpine, poplar and whitewood.

The Rainy River concession contains an approximate area of 800 square miles, and calls for the establishment of a pulp and paper mill at the town of Fort Frances, where the necessary site is controlled by the government. Here the power is already developed by the Ontario and Minnesota Power Company, and merely awaits the building of the necessary mill by the successful tenderer. The mill itself is to cost not less than $350,000, and the output must be at least fifty tons of paper a day, and 200 hands on an average must be employed.

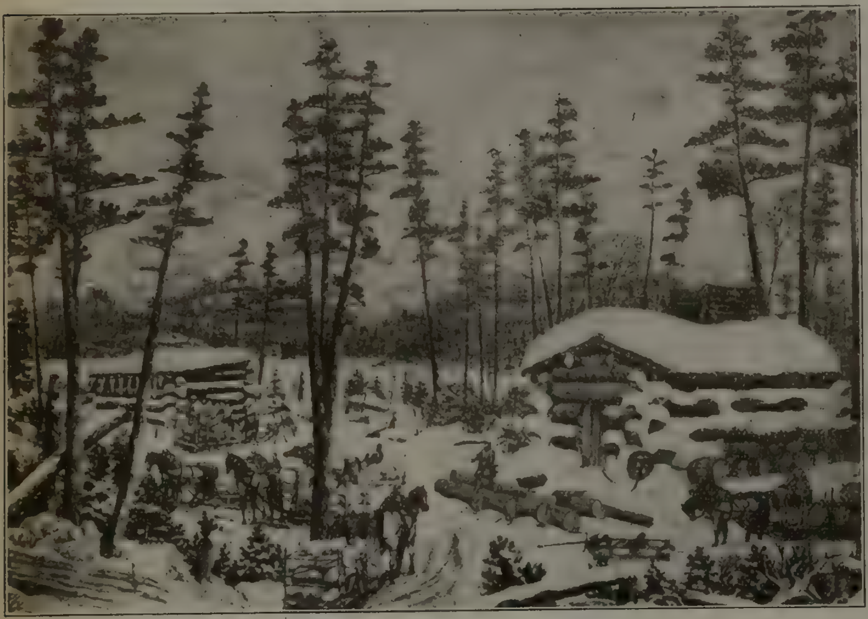
In accordance with the policy of the government, the product of these concessions must be manufactured into paper on the spot, and full precautions must be taken to prevent the pollution of the rivers.

Passing of The Square Timber Trade

Growth of Present Conditions from those of Earlier Days—Economic considerations which caused The Change in Methods—Continued from previous issue

Up to the year 1829, when the first slide was constructed by a son of Philemon Wright, at Hull, the passing of timber over the Chaudiere Falls was attended with considerable labor and occasional loss of life.

At high water the timber was floated down through the Little Chaudiere, on the south side of the Ottawa, to the large bay, known as Nepean bay, at LeBreton's Flat, above the Falls, thence a crib was towed by men with ropes and snubbed around a small eddy, until thrown into the current of water leading to the southern edge of Chaudiere Falls; without this precaution, two-thirds of the timber would have taken the direction of the lost channel passing over the falls into the great cavern, near what is now the location of the Ottawa Electric Power House, from whence it could not be removed until low water, and then only at great extra expense.



Square Timber Camp—Showing Camboose and General Layout.

Pine cribs passing the falls as above described, were broken up, the detached pieces were caught by a boom extended from the lower end of Victoria island to the main shore on the Quebec side of the river, and the timber re-rafted for the Quebec market; cribs of heavy floating timber and staves that could not be secured by the boom, were broken up in the bay above the falls and drawn overland to below the falls to be there re-rafted.

When, in low water, this channel was impassible, the cribs were run over the Little Chaudiere, through the Mast channel, falling down with the current, until passing the reef (long since removed) extending from the island above the Kettle, thence, rounding the reef, were made fast to the island, where two men in a birch canoe, could place the crib in the best position to pass through the Big Kettle, the men returning with the canoe for another crib, and so on, until the whole raft was passed. At this pitch of water, it was necessary to boom the Ottawa river from the point at the Hull landing (near the Eddy Company's sulphite mill) to what is now known as Nepean point, where the timber was re-rafted. The rafts were towed by tugs, and considerable loss was incurred by the rafts being broken up by storms in Lake St Peter. The timber began to reach Ottawa generally in the middle of the month of May and in the '60's the last was not usually down till the middle of September.

Advent of the Railroad as a Lumber Carrier.

In 1883, came another change in the mode of conveying the timber to market, for in this year a raft of timber was shipped by rail from Mackey's station on the Canadian Pacific Railway and another lot from North Bay on the same line; this timber was thus conveyed to Papineauville, 40 miles below Ottawa, and there rafted and taken to Quebec by the old methods. Nowadays, most of the timber is carried by rail right through to Quebec, no doubt, mainly because the prices enable the producer to pay the greater cost of this manner of conveyance, and it also results in a great saving of time.

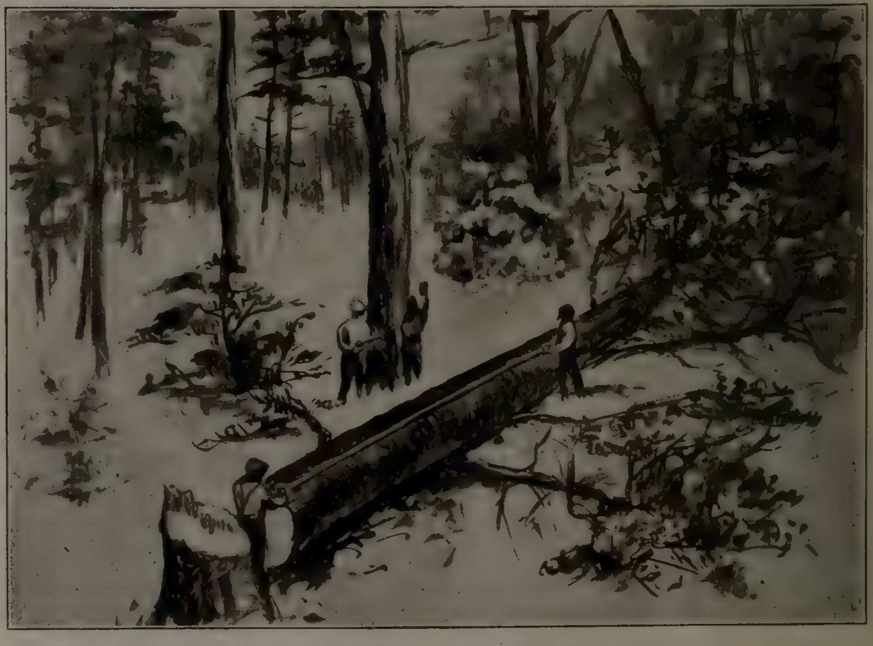
Arrived at Quebec, the timber was put into booms at various points, known as coves, where it was measured, culled and put into shipping order, then shipped and stowed by stevedores, who made a profession of this business. The vessels employed in carrying timber to the old country were barques of six to seven hundred tons register and would usually stow 750 to 960 tons of timber. The average voyage out and in occupied from eight to twelve weeks. There are many yet living who can recall how welcome was the news of "the spring fleet" or "the fall fleet" had arrived, as the case might be, for these vessels usually made two round trips in the season. In 1805, the number of vessels entering the port of Quebec was 146, having a freight capacity of 26,136 tons. In 1859, there arrived at the port, 970 vessels whose freight capacity was 510,814 tons, manned by 17,046 men, while those cleared from the same port numbered 1,051 vessels of a carrying capacity of 539,135 tons, and manned by 17,834 men. The gross total to all ports of the province, inland and sea ports, was 17,417 vessels inward and 16,499 outward bound, of a grand total of 8,313,563 tons.

Ocean-going Lumber Rafts.

The ordinary ship was not the only means adopted of transporting the product of our forests to the old country. In 1824, there was built, in Quebec, a large ship or raft called the Columbus, and in 1825, a Mr. Charles Wood constructed another; both were presumably built at the Island of Orleans. Of the first, no particulars are at hand. but the second, called the Baron Renfrew, was a ship built up of solid timber, etc., as follows: Her dimensions were 304 x 61 x 34 feet, and registered 5.294 tons; main mast 104 feet; topmast 40 feet; top gallant mast 30 feet; rudder post 50 feet x 16 inches; her tiller was a log of oak 32 feet x 16 inches, steered by three wheels with two men to each wheel, she had a crew of 93 men. Her cargo, or more properly speaking, she was built of 84 masts and bowsprits, 3,207 logs of pine, 423 of oak, 15 of elm, 23 of hickory, 4 of basswood, 3 of butternut, one of birch, 15 of maple, 11 knees, 13.398 deals and planks, 4,502 deal ends, 23,089 pieces of lathwood, 4.788 ash oars, 5.148 pipe staves, 75.765 W.I. staves, 19,511 staves and heading, and 34.582 treenails: total, 9.500 tons.

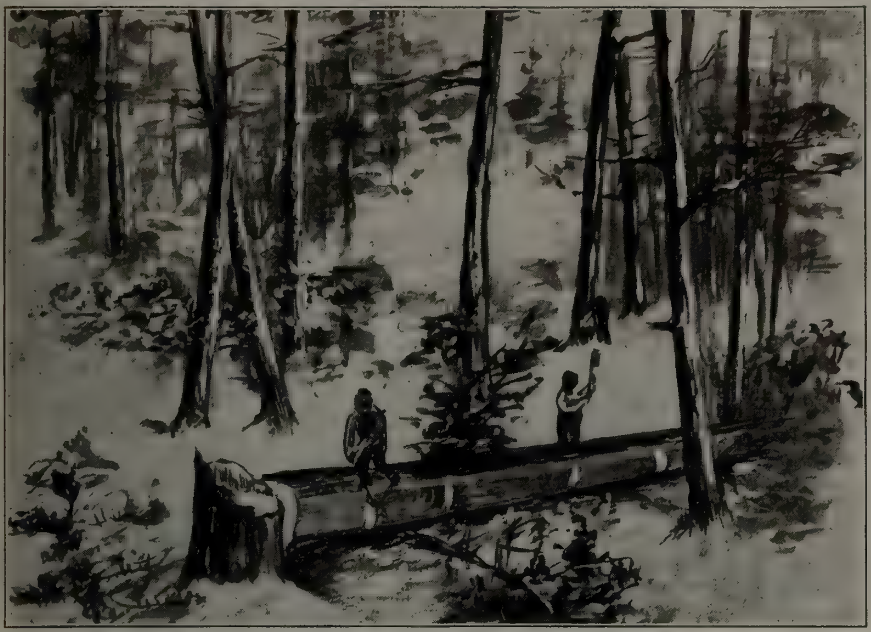
She sailed from Quebec on the 16th August, 1825, arrived in the Downs 16th October following; was taken in tow by two steamers, but grounded on the Longsands off Margate; two days later she floated and was brought to anchor. It should be mentioned that her best bower anchor weighed 90 cwt., and her second best bower anchor was 77 cwt.; she had one cable 26 inches in circumference and steam cable of 13 inches; but a storm arose which cauesd her to drag her anchors seaward and ultimately she went ashore between Gravelines and Calais, and became a total wreck.

In 1859, the value of timber exported was $12,572,759, including costs of all kinds, labor, freight, etc., which was more than half of the whole trade of the province for the year. How inconsiderable was the whole trade of the year 1805, being only $260,000.



Square Timber Cutting—Marking the Fallen Tree.

The largest quantity of timber available at Quebec in any one year was in 1851, and it is recalled by an old resident of Ottawa that in this year the late Hon. John Egan had 31 rafts, which, as each raft represented from 75,000 to 100,000 cubic feet, would make his production of that year about 3,000,000 cubic feet, a quantity which seems beyond belief.



Square Timber Cutting—Scoring the Sides

The woods operations of to-day are descended directly in their main features from those of the square timber days. There is a good deal more comfort for the lumberjack in the woods to-day than there was in the early days, but there is the same hardy outdoor life for them all, as there was in the old days. The square timber work in the woods, however, demanded a much higher type of skill than does the work of the logging operations of to-day. The trees were felled with an axe and as they were the choicest and largest of the trees to be found, the axeman had to be a man of great skill with his tool. When the trunk had been laid low and stripped of its branches and top, it was taken in charge by the scorers. If it was a good straight tree it would be handled entire, but if it had a crook or was defective in other ways it would be cut into two or more pieces. Shaky, twisted or eaty timber had to be cut up into pieces in this manner. After it had been decided how the timber was to be treated, the scorers made nicks in the bark with their axes, and then chopped off the bark between the nicks. The hewers, with broad axes, succeeded the scorers and finished the squaring process, putting on the timber a surface so fine that it could easily be planed. A capable broad-axeman received high wages, as upon his skill depended, in a great measure, the profit to be made out of the timber. The squared timber was floated in small rafts down the Ottawa and when it reached the St. Lawrence it was collected into large rafts and taken to Quebec where it was raised into vessels by means of chains and hooks attached to a windlass.

The Open Fire Place or "Camboose"

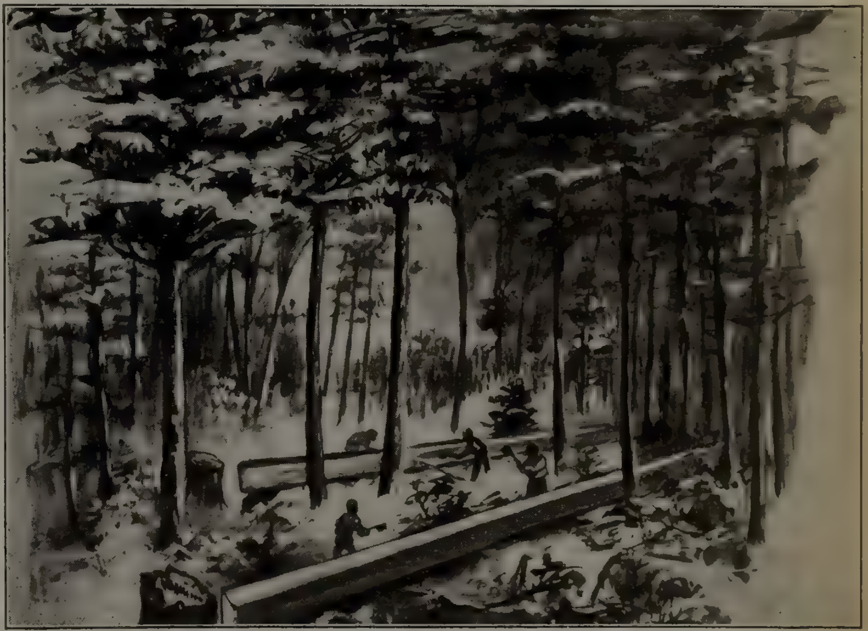
One of the chief characteristics of the lumbering camps in the square timber days, which has been done away with in the modern camps, was what was known as the "camboose." The cooking for the lumberjacks was done in the middle of the log cabin around the sides of which were arranged the tiers of bunks in which the men slept. The smoke from the cooking escaped through a hole in a roof; at least that portion of it which did not float in among the men's sleeping bunks. Crude as this method of cooking seems, in the light of the large cook stoves which are installed in the cook-house of modern camps, there are many old lumberjacks living to-day who regret the passing of the "camboose," and declare that there never were meals the equal of those which were prepared in the open fireplace in the centre of their olg cabin. It would scarcely do, however, to try to introduce the old order again. The lumberjacks of to-day are too well off, so far as many of their bodily comforts are concerned to have any desire to go back to the old order of affairs.

Beyond question the square timber business is a thing of the past. It has passed almost completely into history. Two summers ago a solitary raft came down the Ottawa river, which had been ordered by some English customers of J. R. Booth. Last summer, Mr. Booth was strongly urged by one or two English customers to make a raft for them, but he could not see his way clear to do so. The difficulties in the way are becoming greater every day. The timber is extremely difficult to obtain. Capable broad-axemen have become almost impossible to find. Men who know how to conduct a raft safely down the dangerous parts of the rivers are disappearing, and the slides are becoming disused so that to take down a raft to-day would be, not only an extremely difficult matter, but would involve risks which the lumber manufacturers of to-day do not believe would be justified. There is a bare possibility that Mr. Booth may yield to pressure next summer and try to make up one raft, but it is scarcely probable. little square timber finds its way to the markets of Great Britain from Canada in the future will be transported to the seaboard by rail. The interest which was taken in the trip of the last raft which was brought down by Mr. Booth was astonishing. When it passed through the slide at Ottawa it was necessary to have the police of the city guadr the sides, so that hundreds of onlookers should be prevented from jumping on board for a ride. In the old days scores of rafts passed down the slides daily and none but a few wayfarers took any notice. To-day the passage of a raft would be an event to be chronicled in the press all over the country and representatives from all the important newspapers would be sent to provide the people of Canada with a graphic account of this unique and rare event.

Reminiscences of a Pioneer

There are a number of men engaged in the lumber business at Ottawa to-day who have seen the square timber trade in its best days and have become important manufacturers of sawn timber. J. R. Booth, of course, is the notable instance, and everyone who ever had anything to do with the lumber business knows a good deal about this wonderful man. Another is Senator W. C. Edwards. If Senator Edwards were disposed to do so he could write a story of the lumber trade of the Ottawa valley which would be as good reading as anything that has ever been written about the business. A representative of the CANADA LUMBERMAN recently had the pleasure of visiting Senator Edwards in his little red brick office at Ottawa, and, during the course of an hour's talk he had an opportunity of learning something about the lumber trade and appreciating the genial good nature of the Senator's business habits. It took only a short time to induce him to open out on the subject of the timber trade, and on the spur of the moment, without consulting any records or hesitating to brush up his memory, he gave the following interesting outline of the trade:—

"Philemon Wright was the first lumberman on the Ottawa river. He settled in Hull away back in the early days of the last century. He was the first man to bring square timber down the Ottawa river, at least past the Chaudiere Falls. In a short time the trade in square timber commenced to increase and a number of others became interested in it. Among the very earliest prominent men who engaged in the manufacture of square timber were the late John Egan, father of H. K. Egan, of the Hawkesbury Lumber Company. Another was Joseph Aumond. There was also Dan McLachlin, father of the present Hugh McLachlin, of McLachlin Brothers, Limited, Arnprior. Then there was a coterie of men in the square timber business, including David Moore, William and John Bell, Hon. James Skead, Robert Skead, Isaac Moore, Andrew Supple, Wm. Isaac, Ephraim Mohr, Jonathan Francis, Peter McLaren, Wm. Caldwell, Boyd Caldwell, Colin McDonald, Alex. McDonald, Andrew and Peter White, Alex. Barnet, Thos. Mackie, the two Dunlops, Mr. Gillies, father of the Gillies Bros., of Braeside; Wm. Thistle, Richard and Ronaldo McConnell, R. and J. Klock, and a great many more. You see, if you got them all, you would have some hundreds. These men were all above Ottawa city. The most notable of these square timber manufacturers was the late John Egan. He died before he was 47 years of age. If he had lived he would have cut a tremendous figure in the lumber trade.



Square Timber Cutting—Finishing with the Broad-axe

On the lower Ottawa the largest square timber operator was Stephen Tucker. In addition to him there were George Dunning, J. and B. Grier, Albert Hagar (who is still living, and is about 80 years of age, the sheriff of the counties of Prescott and Russell), and Martin

Casselman. These were the principal ones. They took timber both to the Lachine market and to the Quebec market. The Upper Ottawa operators confined themselves almost entirely to the Quebec market. In the height of the square timber business a few rafts annually went to Whitehall, N.Y., and to New York city for dock construction, but the great bulk of the square timber went to the Quebec market for shipment to Great Britain. The business began with a few rafts away back in the last century and gradually increased until the quantity reached as high as twenty million cubic feet per annum, from 1865 to 1875. Then it gradually commenced to decline and the decline continued steadily until the quantity ran down to very small proportions, not more perhaps than half a million feet per annum.

"The early sawmill men, large lumbermen of the Ottawa River, would be Hamilton and Low of Hawkesbury, afterwards Hamilton Brothers; Gilmour and Company of Chelsea, the late Daniel McLachlan, of Ottawa, and Phillip Thompson, of Ottawa. John Egan also had a saw-mill in his time up the Ottawa. So had the McLachlins. Daniel McLachlin moved his saw mill, early in the history of the sawn lumber trade from Ottawa to Arnprior. Lanson Cook, in the early days, had mills on the North Nation river, which were afterwards sold to Gilmour Company. A mill was also owned by John A. Perkins at Blanche River, and there were two saw mills at Buckingham. One was originally owned by Bowman, and the other by Bigelow. The Bowman mills were sold to James and John McLaren in 1864, and are still owned and operated by the McLaren family. The Bigelow mills passed into the hands of Thompson & Company of Quebec, and were afterwards sold to Lemoyne Gibb & Company, of Quebec, then to Ross Brothers, of Quebec, and finally the entire property was sold to the McLarens, and is now owned by the James McLaren Company.

When Eddy came to Ottawa

"About 1853, I think it was, Mr. Eddy came to Hull. A few years later he was followed by Bronson & Weston, Perley & Pattee, Levi Young, A. H. Baldwin, and John R. Booth, all of whom cut a very large figure in the saw mill business for years. Great changes have been brought about since those days. Death and changes in the scene of operations have resulted in many of the old names disappearing and others taking their places. To-day the principal lumbermen on the Ottawa river, beginning at Hawkesbury, are: The Hawkesbury Lumber Company, the James McLaren Company of Buckingham, John R. Booth, Ottawa; Shepard & Morse Lumber Company, Ottawa; Gilmour & Hughson, Ltd., Hull; W. C. Edwards & Company, Ltd., Rockland and Ottawa; Fraser & Co., Ottawa (sons of the late Alex. Fraser, who, in his day, was one of the very largest square timber men on the river); McLachlin Bros., Ltd., Arnprior; Gillies Brothers, Limited, Braeside; R. and T. Ritchie, Aylmer; The Colonial Lumber Company, Pembroke, and The Pembroke Lumber Company, Pembroke. The large pulp and paper companies are the E. B. Eddy Company, Hull; J. R. Booth, Ottawa; James McLaren & Co., Buckingham, and the Riordon Pulp & Paper Company, Hawkesbury."

A Modern Lumber Organization

Of all the companies which Senator Edwards mentioned in the above account of the lumber industry none occupies a more honorable or deservedly prominent position among the great industries of Canada than that over which he himself presides, of which he was the founder and builder, and in which he continues to-day to take a minute and active interest. He conducted the representative of the Canada Lumberman through the offices and plant of the company at Ottawa and pointed out with pride, all the improvements which he has been making in the last few years. The chief centre of interest about the Ottawa plant is the planing mill. This mill is constructed upon the latest scientific principles. From an engineering point of view alone it is a great institution. As a planing mill, however, it will, when complete, stand head and shoulders above everything else of its kind in Canada. The buildings are constructed of concrete and brick. They are absolutely fireproof, and throughout them all there is a great abundance of light. The facilities which Senator Edwards has provided for the production of finished lumber products on a gigantic scale, are admitted by all who see them to be the best that skill and capital can provide. The foundations for the buildings in many cases have been hewn out of solid rock. Great hydraulic plants are buried down deep in the rocks and tremendous streams of water are drawn from the Rideau river, through tunnels bored through rock which lead them to the turbines, where power is generated for the plant. All this, one would imagine to be the work of experienced architects and engineers. But if there is one thing for which Senator Edwards is noted it is his habit of superintending practically everything of importance which is done about his plant. Engineers had something to do with drawing up the designs and specilcations of this new plant, but the moving figure in it all was Senator Edwards. Every detail of the construction has been superintended by him. There is scarcely a square foot of the rock excavations which he has not directed personally. The installation of every piece of machinery has been superintended by him. Every engineering problem which has turned up in the work of construction has been solved by him, with practically no outside assistance. The whole plant, like the business itself, has practically been built by him, and he takes pride in pointing out all that he has done.

"Our business was originated at Rockland in 1868," he said, "by myself and the late James Woods. We were joined in 1871 by my brother, J. C. Edwards, and John A. Cameron, of Cameron & Edwards, of Thurso, with whom I learned the business. Cameron and Edwards were among the first saw mill men at Thurso, in the early sixties. They afterwards bought out Gilmour & Co. at the Nation Mills, and we finally bought them all out. We did a steadily-growing business at Rockland, and this business is still carried on, on a large scale. About eighteen years ago we bought out the property at Ottawa from the estate of the late James McLaren. The mill on the Ottawa side of the river was burned down soon after and was replaced by a more modern one. We bought the New Edinboro mills about a year later.

A Story of Continual Progress

Fires were unfortunately of frequent occurrence with the company, but they did not interfere much with its progress. The Rockland mills were burned with all the lumber in 1907. The company suffered very heavy losses in each case. Profiting by these experiences Senator Edwards decided that any new buildings he put up would be fireproof, and the new planing mill, built entirely of fireproof material, with its fire-proof storage sheds, was the result. Not only are these buildings believed to be unquestionably fire-proof, but they are so well protected with automatic sprinkler systems that if any of the lumber stored therein were to catch fire, it would be almost an impossibility for the fire to destroy more than a few dollars worth of the lumber. Just to be fashionable, however, Senator Edwards carries a fair amount of insurance on the buildings and contents. He does not intend in future to be worried about fire losses.

The plants at Ottawa and Rockland are pretty large institutions, but they do not represent by a long way all the interests which this company possess. They are interested in Burlington, Vermont, where Robinson Edwards Company have a planing mill and a distributing yard. The Bathurst Lumber Company, at Bathurst, N.B., of which the W. C. Edwards Company are the owners, and of which Senator Edwards is president, owns mills and limits at Bathurst. The company also have mills and limits at Bonaventure and Little Cascapedie in the county of Bonaventure, Quebec.

If one wished for an illustration of the character of Senator Edwards it would be afforded perhaps better than anything else by the arrangement of his business office and the office of his clerks. Walking out to the plant from Ottawa one comes first of all upon a little red brick building which looks as though it might be a foreman's office. Upstairs, however, is a big bright room, with a large flat top desk in the middle, which is the office of the Senator, and in the one or two other rooms which comprise the building are located the few secretaries and clerks necessary for the head office business of this large company. The whole building is unpretentious, and the occupants are as easy to approach as the most timid traveller who wishes an interview could wish. The point about this office which, perhaps, may not be noticed at first, however, is that from its windows a view is obtained of every one who approaches from Ottawa. Every load of lumber which goes toward the city passes the windows. A good view is obtained of much of the plant and from the rear one looks out upon the Ottawa river where the company's barges unload, and across the water to the Laurentian hills over which the sun sets beautifully nearly every evening in the week. The location of the office and its equipment speak of the Senator's arrangement at every turn.

A Branch Office to be Proud of

If a hapless traveller, however, or any other person upon business bent, should chance first of all to call at the company's branch office across the Rideau he would receive a very different first impression. Here is a fine brick building with an imposing stone doorway and with the interior handsomely finished in mahogany. "They're proud over here," remarked the Senator, by way of apology, when showing the Canada Lumberman representative over the building. They have much to be proud of, however, for a finer and more pleasant office to work in would be hard to name. The mahogany finish is one of the most noticeable features of the interior, and there is one particular piece, in one of the private offices which generally attracts the admiration of the visitor. The grain and the color are both very choice, and many a connoiseur walks up to inspect it closely, with delight written upon his face. If he taps the surface with his knuckles, however, there is a surprise in store for him, because this particular piece is not mahogany at all, but cement finished to match the rest of the woodwork in the office. On account of this wall being an outside wall, it was necessary to finish it in cement instead of wood. If the advocates of cement could only secure a good illustration of this particular piece of wall it would be one of the best advertisements they could find.

All this about the W. C. Edwards Company is somewhat aside from the story of the square timber industry of the Ottawa Valley, but it is interesting as giving an idea of what has developed out of the lumber industry. Old Philemon Wright, in his day, would never have dreamed of the changes which were to come over the industry when the people of the valley should discover that shipping square timber was not a business-like proposition. The whole development of the Ottawa Valley lumber industy has been a vindication of the principle which has built up every great industry the world over. It shows that progress depends more than anything else upon the careful utilization of every atom of raw material. Where there is such a combination of raw material and power as in the Ottawa Valley, the only thing wanting for the creation of a prosperous industry is the presence of brains and energy. The early pioneers of the valley possessed both of these, and in the square timber industry they laid foundations for a future industrial greatness which, in its way, contains more of all that goes to the upbuilding of a great and prosperous people, than almost any other that could be instanced. Fortunately these men transmitted to their children in large measure the same characteristics which enabled them to hew their own fortunes out of the forests. There is something about the life of a lumberman which assists him to grow up into a broad-minded and capable business man. The lumber industry of the Ottawa Valley is remarkable for many things. First of all it has made a few millionaires. Secondly it has supported, in comparative comfort, a large working population, and third it has been unique for the fact that the descendants of the wealthy men whom it produced, have in every instance been men of business capacity and energy sufficient to carry on and develop the great undertakings to which they have succeeded.

Liability for Forest Fire Losses

Railway Representatives Alarmed at Proposed Legislation—Real Situation Misunderstood—Co-operation Needed

The recent announcement by Hon. Clifford Sifton, chairman of the Conservation Commission, that the Dominion Government would be asked to introduce legislation making the railroads liable to a penalty for fires starting from their right of way, unless they can prove that they have taken all necessary precautions to prevent them has led to a vigorous assertion by a prominent Ottawa railway official that the railways are not the causes of forest fires, and that the lumbermen are the responsible parties. The article, which appeared in the Ottawa Citizen, was as follows:—

Railway Companies Disclaim Responsibility

A high official said to-day that evidently Mr. Sifton had not informed himself of what the railways had done for the protection of the forests of the country from fire. They co-operated warmly with the forest rangers. The utmost care was exercised in the stoking of the engines, and screens of the best and most approved type were used to suppress sparks from rising out of the chimney stacks.

"It would be a monstrous thing," said this official, "to hold the railways responsible for all forest fires adjacent to their lines. The majority of fires for which the railways have been blamed were caused by tramps who trespassed on railway properties and kept themselves warm at camp fires which they left burning and were thus a source of forest conflagration.

"Lumbermen, too, often build their camp fires near the railways and leave the embers unextinguished, with the result that when a gust of wind arises they are blown into the forest and in an instant the dry brushwood and withered grass are aflame and a fire which may extend for miles and last for weeks is raging.

"Many such fires are laid to the charge of the railways for the lumbermen who are the real cuplrits, screen themselves and their assistants and the so-called official reports are thus packed with misleading statistics. A series of reports from which Mr. Sifton quoted as justification for the bill which he is to introduce into parliament appear to be of this character, as regards the information from Ontario and the Western provinces.

"Not only is the return incomplete inasmuch as it does not deal with Quebec and the eastern provinces, but the information it does give is drawn from sources that, to put it in the mildest terms, are open to question and unreliable."

The incorrectness of the above interview is exposed in a letter which was published in a subsequent issue of the Ottawa Citizen, written by Mr. Frank Hawkins, secretary of the Canadian Lumbermen's Association. Mr. Hawkins' letter was as follows:—

The Necessity for Co-operation

Editor Citizen: In your issue of Friday, December 23, under the heading "They disclaim responsibility," appear statements to which this Association (Canadian Lumbermen's Association) take serious objection. The interests which I have the honor to represent are not concerned with criticism of contemplated or pending legislation, nor in an attempt to prejudice public opinion against any measure which has for its object the preservation and perpetuation of Canada's forest wealth.

It may fairly be assumed that the railways are deeply interested in this matter, apart entirely from mere sentiment. Lumber and products of the forest gave the railways of Canada over 17½ per cent. of their gross tonnage during the year ended June 30, 1910. If lumbering in Canada ever comes to an end the railways will be deprived of their most profitable business. It therefore should be the part of the railways to join in any movement which will preserve for all time such a vitally important national asset. Lumbermen fully appreciate this and the statement that they leave embers unextinguished in their camp fires is really so palpably silly and untrue that it hardly needs contradiction. It would be just as reasonable to accuse the railways of burning up their property. The inference, too, that lumbermen pack official reports with misleading statistics is also quite gratuitous and is unworthy of so vast an interest as the railways.

May I be permitted to add also that it would be in the interest of journalism and the public welfare if, before making such outrageous charges against so important an industry as lumbering, that facts only be ascertained and published. Such statements might possibly be ignored if they appeared in a newspaper of lesser influence than The Citizen. So far as the accusations against the lumbermen are concerned, a flat, specific and emphatic denial is given thereto.

The position taken by Mr. Hawkins is substantiated also by an interview with Mr. M. J. Patton, acting secretary of the Conservation Commission, which was published in the same paper. Mr. Pattons' remarks were as follows:—

"The railway man who gave that interview was not informed of the facts. Statistics respecting fires set by railways as given by Mr. Sifton in his recent address are from the most authentic source. hen it was known early in the season that forest fire losses this year would likely be heavy, the commission of conservation despatched expert officials to visit the scenes of the various fires and investigate the causes. The reports of these men have been made, and show that over 30 per cent. of the forest fires for which definite causes could be assigned were caused by railway locomotives. This information was gathered by thoroughly experienced men, and is of the most reliable sort. The conservation commission in advising legislation to prevent the enormous annual fire losses from this cause made sure that their recommendations should be backed home with facts that were in no wise open to question.

"Then there is a most inexcusable ignorance displayed regarding the legislation the commission is asking the Government to pass. The statement that the enactment of the legislation recommended would hold the railways responsible for all fires adjacent to their lines is not true. Nothing of the kind has ever been proposed. What the commission did recommend was that railways should be liable to a penalty for all fires actually caused by sparks from their locomotives, and for all fires which were allowed to spread from their right of way to adjacent lands. They will not be held liable for fires if they can show that they had on their locomotives the best modern appliances to prevent the emission of sparks; that their employees had shown no negligence in conducing to the starting or spreading of fires; and that they had a properly equipped fire fighting staff to check fires once started. In other words, the railways are to be liable to a penalty for fires they start unless they can show that they have used every reasonable precaution to prevent damage from that source. No fair-minded man can say that such legislation would be unreasonable."

The Late Peter McArthur

On Friday, December 30, 1910, there died at Detroit, Michigan, Mr. Peter McArthur, the last surviving member of the well-known lumbering firm, The McArthur Bros. Company, Limited.

In the early days in Glengarry county, one of the leading lumbermen there was John McArthur, and about 45 years ago his eldest son, bearing the same name, established himself in the lumbering business in Toronto. A few years later he was joined by his two younger brothers, Alexander and Peter. The industry and application of the three brothers eventually developed one of the largest lumbering businesses in America, their specialty being square timber. The firm's operations were carried on extensively in Quebec, Ontario and Michigan, and in later years in the Western and Southern States. Shortly before the death of John McArthur, the senior member of the firm, they formed themselves into a joint stock company with head office at Toronto and branch offices in Quebec and Detroit, with agencies overseas at London, Liverpool, Glasgow and Belfast.

The reputation of the firm both at home and abroad was excelled by none of their competitors and their trademark "M. A B." was a guarantee of quality in all the European lumber marts. Shortly after the conversion of the partnership business into a joint stock company in 1886, Mr. John McArthur died and was succeeded in the presidency of the company by his brother Alexander, who continued as head of the company until his death in 1895 at Ashville, North Carolina.

Mr. Peter McArthur was the resident manager of the firm in the United States, residing for many years at Saginaw, Mich., and subsequently moving to Detroit in 1893. On his brother Alexander's death he became president of the company in 1895. Mr. Peter McArthur was a typical specimen of the Glengarry Highlander, of splendid physique and unwearying energy, devoting all his ability and native shrewdness to the development of the business. Few lumbermen were as well known throughout the United States and Canada and his judgment upon timber limits, their qualities and quantities was accepted without reserve.

Under the presidency of Mr. Peter McArthur the operations of the company were extended even to Idaho, California and Mexico, and the holdings of the company assumed unusually large proportions in Canada and in the United States. Notwithstanding his extended residence in the United States, Mr. McArthur did not lose touch with his old home, and during his later years he always spent a few of the summer months with his family at the old homestead at Glengarry, of which he retained ownership to the last.

Mr. McArthur is survived by three sons, Percy, at present attending Ann Arbor University, Peter at home, and Robert, attending McGill University. The well-known Chicago physician, Dr. R. D. McArthur, is the only surviving brother.

Shingle manufacturers on the Pacific coast have decided to incerase the price of shingles. At a recent meeting it was agreed that the prevailing prices were too low for any profit. The result was an increase of 20 cents. The prices at Toronto, according to the new schedule, are as follows: 4x, $3.20 to $3.30; 3x, $3 to $3.10.

Forest Rangers Must Be Capable

Ontario Government Introduce Radical Changes In Appointment—To Go Into Effect Immediately

The Ontario Department of Lands, Forests and Mines has decided, following the investigations of Hon. Frank Cochrane, which have covered several years, to make radical changes in the regulations covering the selection and duties of Ontario fire-rangers. The staff of rangers this year will be required to qualify according to the new standards, and the prevalent idea that the post of fire-ranger is provided as a holiday convenience for a number of inexperienced students is to receive its quietus.

The new regulations, which have been approved by the Government, have been made public. The season ordinarily lasts from May 1 until September 30, but may open earlier and close later. The rangers will be paid $2.50 a day for seven days in the week. The department will supply canoes, tents, cooking utensils, etc., and the rangers pay their own railway fare and supply their own foodstuffs. The list will close on March 31 to allow time for selection and organization.

Applicants who are students requiring to take examinations must be exact in the information as to when they are available. In the spring of 1910 a number who said they were free from May 1 were appointed at that time. It was then found that many would not be free until the middle of the month or even as late as the 24th. As a result the service was thrown into confusion in the early stages, and in many cases this lack of accuracy on the part of the applicant resulted in the loss of the position. This year any applicant who is not immediately available when appointed will forfeit all claim to consideration. A number of students also put the department to inconvenience last year by having to leave their work before the end of the season to take supplementary examinations. Where this occurs in future any expense incident to sending another man to fill the vacancy will be deducted from the ranger's pay and he will also have difficulty in securing re-engagement.

Practical Woodsmen Required

Rangers must be prepared to swing an axe in cutting portages, building shelter huts, etc., when not actively engaged in fighting fire. Bush experience of that sort is essential. In their anxiety to secure appointment many declare their ability to handle a canoe when they are better adapted for work along the railways. The department requires as many men for one class of work as the other, and it would save confusion and annoyance, the loss of the position and possibly the loss of life if applicant would bear this in mind. Applicants who are not strong physically should not apply. Anyone found to be in ill-health or not physically fit on reporting or who, after trial, is found to be deficient for any reason whatever will be dismissed and will thus lose the money spent in travelling.

The aim of the department is to have the staff, as far as possible, composed of experienced men, and preference will be given applicants with experience whose record with the department has been satisfactory. Sound judgment is necessary, and obedience to the instructions and directions of the Chief Rangers is expected. Lack of judgment, foolhardiness and disobedience of orders resulted in the death of five rangers last season. In no instance was the loss of life incidental to the discharge of duty as rangers, and hereafter the department will decline to bear the expense of searching for bodies or meeting, in whole or in part, funeral expenses where death has resulted other than from the discharge of duty.

Persons whose hunting instincts are stronger than their sense of duty need not apply. In view of the loss of life last year through the careless handling of firearms, and the temptation to kill game for food, rangers will hereafter not be permitted to carry arms of any kind nor to have them in possession. Ranges must remember that they are ex-officio game wardens as well as fire rangers, and it is their business to thoroughly enforce the fish and game regulations. Any ranger found deficient in this respect will not only be dismissed, but will be made a public example.

Devote Full Time To Duty

Rangers must not undertake other employment while employed by the department. This applies particularly to rangers stationed near railway construction work and mining operations. Nor may rangers who are local men leave their beats to work on their homesteads. Any infaction of this regulation will entail summary dismissal and loss of pay. Chief rangers have been somewhat slow to exercise the power of dismissal vested in them by the department. In future any failure to dismiss an incompetent ranger after fair trial will be visited upon the chief responsible. Rangers must understand that the power to dismiss is vested in the chief and govern themselves accordingly.

Personal News of Interest to Lumbermen

Mr. M. P. Kinsella

Mr. M. P. Kinsella, formerly manager for the Skillings, Whitneys and Barnes Lumber Co., of Ogdensburg, N.Y., has been appointed manager of their New York office at 1 Madison avenue, to fill the vacancy caused by the death of the late J. D. McLaurin. Although he has been in charge of the New York office for a short time, he will not take up his residence in New York until about May 1.

Mr. Kinsella's advancement will be recognized by all in the lumber business as having been thoroughly earned by faithful and successful work. Mr. Kinsella was born in Trenton, Ont., and early in life entered the lumber business with Messrs. Gilmour & Co., of Trenton, filling various important positions with that firm. In 1902 he became Canadian salesman for the Skillings, Whitneys and Barnes Lumber Company, and in 1905 was appointed Ottawa manager, which position he occupied until his recent appointment to the managership of the New York office.

Mr. Kensella is also a stockholder in the Skillings, Whitneys and Barnes Company, a stockholder and director of the Cavendish Lumber Company, Lakefield, Ont., and a stockholder in the following companies: The Strong Lumber Company, Orillia, Ont., The George Gordon Co., Ltd., Cache Bay, Ont.; the Campbell-MacLaurin Lumber Company, Ltd., Montreal; The Gordon Development Company, British Columbia, and the Marine Transportation Company, Ogdensburg, N.Y.

Charles R. Shaw, formerly Canadian manager of the Herman H. Hetler Lumber Company, Chicago, Ill., has resigned his position to engage in business with Edward L. Casey, who was until recently secretary of the same company. The new company will be known as The Casey-Shaw Lumber Co., Ltd., and will have its headquarters at Toronto and mills at Sudbury. The capital of the company will be $50,000 and the incorporators, as given in the announcement in the Ontario Gazette, are E. L. Casey, Chicago, Charles McCrea and George J. Valin, Barristers, Sudbury.

Read Bros. is the title of a new firm of wholesale lumbermen who are doing business at 18 Toronto street, Toronto. Alfred E. Read was in business at the above address up to January 1st, when he was joined by his brother Alex. P. Read formerly in the employ of John H. Eyer. Both are progressive business men and have a big connection in the lumber industry.

On the occasion of the departure of Mr. G. L. Keeling from Warren, Ont., the citizens made him the recipient of an address and a gold-headed cane.

Mr. Donald Ross, of the Woods and Forests Branch of the Department of Lands, Forests and Mines of the Province of Ontario, died recently at the age of 74.

Mr. John Tod, former senior clerk in the Dominion Crown Timber Office at Winnipeg, has been made assistant Crown Timber Agent.

Necessity may be the mother of many inventions, but there are others that are evidently fathered by the same desire that begets the sale and purchase of gold bricks.

The official returns for the winter port trade of St. John, N.B., show a falling off of half a million dollars as compared with the corresponding period last year. The total Canadian exports for sixteen liners amounted to $1,785,267 as compared with $2,355,476 in 1909. There is also a decrease of nearly $43,000 in foreign exports through this port. The decrease is due almost entirely to the poor condition of the lumber markets in Great Britain. Deal shipments this winter have been light, while last year they were very heavy. Lumbermen report that the unsettled state of British politics is to blame for the poor markets on the other side and they hope for recovery before spring comes. There is a great quantity of deals at the port ready to be sent across as prices pick up.

No man is indispensable, but it's a good idea to strive to be as nearly so as possible.

Railroads' Interests in Forests

The Greatest Single Consumhes of Timber — Their Share in Cost of Marketing — An Enlightened Railway Policy

At the recent Lake States Forest Fire Conference, R. H. Aishton, vice-president of the Chicago & North-Western Railway Company, delivered an interesting address upon "The Interest of The Railroads in Forest Protection." After dealing with the forests and railways of the Lake States in a statistical manner, Mr. Aishton made the following general and practical remarks:

It is hardly necessary for me to call your attention to the fact that the railways are, and will be for years to come, the greatest single consumer of the products of this timber country, and furnish a ready market for the settlers, lumbermen, and for other interests, and they realize fully, I think, the benefits accruing to them through conservation of the remaining forest areas in these States lying right at their doors, and they also fully realize that for every dollar they pay for piling, posts, lumber or ties throughout this district a certain portion of it comes back to them necessarily through the cleaning up and cultivation of the country; the additional number of people who are capable of earning a livelihood and for whom they must transport the necessaries of life and to whom they must look for their support.

From another standpoint: Minnesota, Northern Wisconsin and Michigan forest country is to-day the most attractive fishing, hunting and summer resort territory left in this great country of ours and tributary to the geatest centres of population in the country with the single exception of the Atlantic Seaboard. The railways, more than anybody else, appreciate the possibilities of the proper conservation, care and development of these areas, and that where they now carry people by the hundreds to these resorts they will soon be carrying them by the thousands with resutling benefits both to themselves and to the communities residing within these districts.

There is another interest which might be mentioned. Some of our railways are among the largest owners of timber lands within the boundaries of these states, and while we have heard a good deal about conservation of the forests I believe you gentlemen who are familiar with the Forestry Department, and in charge of them for your states, will bear me out in saying that the railways do, and are doing, as much in the actual work of conservation and protection of the forests as any other interest.

If we measure the interests of the railways by dollars I do not think there is any question in the minds of anybody here that their interests are equal at least, if not outweighing any others. The destruction, or partial destruction, of the timber area in any one of these three states, means to the railways deprivation of revenue for a long term of years, and perhaps forever. Other interests, when such calamities occur, can pull up, transfer their interests and move away. Not so the railways—they are compelled to operate no matter what the conditions may be.

We have heard a great deal lately about the cost of living. With the wiping out of the tie, post and lumber supply through this northern lumber country, the effect on the maintenance cost to the railways, about which we have heard so much in the rate hearings lately, would be particularly disastrous.

We all remember the day when the northern limit of agriculture was about at Green Bay, Wis. To-day we find bordering the lakes, successful agriculture carried on right up to and beyond Lake Superior, and where formerly the forest held sway we find to-day prosperous and contented settlers improving the land, raising crops, and sustaining not only themselves but the large communities incident to that territory. Had this territory been deforested through fires the ability to get settlers to go in there would have been limited as, in a great many cases, even the soil itself is destroyed or rendered unfertile through fires passing over it, and the ability therefore to develop agriculturally is gone.

The question now occurs, what, with all their varied interests in the prevention of forest fires, have the railways done to prevent them? I know what the general practice has been.

First.—Maintenance of a clean right of way, free from brush, stumps and rubbish.

Second.—Co-operation with the fire wardens in keeping the right of way thoroughly cleaned up and burned off.

Third.—Absolutely prohibiting the setting of fires by sectionmen, or other employees, except during the winter months or under the direction or order of the fire warden.

Fourth.—Installation of the very best and most approved netting in the front ends of locomotives, and constant investigation and experimenting into every new appliance that promises any relief from fire.

In connection with this a very thorough system of inspection at terminals and records of the condition of netting, and arrangements for repairs of same when defective.

Fifth.—During particularly dry periods the abondonment of freight service during daylight hours.

Sixth.—When dry conditions prevail, the establishment of patrol, either behind trains moving through the disrtict, or at points in close enough proximity to each other, to guard against fires starting on the right of way.

Seventh.—By instructing train crews and engine crews on the importance of avoiding every possibility of setting fires, and directing them when fire is found on the right of way, to stop their trains wherever practical and put it out. Or in case where their own, or any other, train would be endangered by such steps by leaving word with the first agent or section crew and having them start back all the help possible to put out the fire.

What further can the railways do? I am very frank to say that I do not know, other than this.

They believe that the protection of the forest, now, conserves the revenues of the railways in the future, and to many of the railways it means their future life and property.

They believe that the protection of the forests may be bettered by more efficient control by the officers of the states over all the interests engaged in business in the timber areas.

They believe in taxation that will enable a well trained and efficient force to be organized and maintained in each state, and endowed with police powers, for the protection of the forests.

They believe the interests are so great and so identical that settlers, lumbermen, manufacturers and railways, and every other interest should unite in a plan to which all can work, which would be harmful to no interest but beneficial to all.

Questions and Answers

The object of the Canada Lumberman and Wood Worker is to give information to its readers, both of a general and a news character, upon all matters of interest to the manufacturers, consumers and users of lumber. The editor will be pleased to receive questions from readers upon any subject and will endeavor to give early answers to them. Readers will also be conferring a benefit upon other readers if they will send in any comment which they consider of value upon questions which appear in these columns. Following are a few questions which have recently been received:—

An Ontario dealer in hardwoods writes to know the meaning of the term "common and better." He has had a disagreement with a customer to whom he made a sale of "common and better" at a low price, believing that it would include all three grades of common. The purchaser, however, claims that it should include only the number one common and all above.

According to the rules of the National Hardwood Lumber Association, which are the accepted rules in Ontario, "common and better" includes only the number one common and all better. The number two and three common could not be included unless they were definitely specified.

A correspondent asks whether it would be right to use the following rule in connection with the Scribner log rule, to find the feet board measure of logs of the following lengths:—

For a 4-foot log, 4" diameter and up; to take one-third of the measure of a 12-foot log or one-half of an eight-foot log. For a 6-foot log, 4" diameter and up; to take one-half of a 12-foot log. For a 8-foot log, 4" diameter and up; to take one-half of a 16-foot log. For a 10-foot log, 4" diameter and up; to take one-half of a 20-foot log. Also the writer wishes to know the contents of logs 4" and 5" in diameter and 4', 6'. 8', 10'. 12', 13'. 14'. 15', 16'. and 17'. long.

In regard to the first question it would not be technically correct to use a fraction of a larger log measurement to find the measure of a smaller one, but in practice the result will work out fairly close. As to the second question the contents of the logs are given in the various tables for the longer lengths. According to the International Rule, which is the closest to the actual mill results, the following would be the contents of the logs from 8 feet up:—

Length of Log in Feet

Diam. in inches	8 ft.	10 ft.	12 ft.	13 ft.	14 ft.	15 ft.	16 ft.	17 ft.
4	—	5	5	5	5	5	5	10
5	5	5	10	10	10	10	15	15

For the 4-foot and 6-foot logs the only way to arrive at a measure would be by taking a fraction of a large log, or by depending upon actual mill tests.

The Alberta retail lumbermen will organize into an association similar to that existing in the other prairie provinces. It will be based upon broad lines and will not combine with other similar organizations. The objects are mutual protection and insurance and friendly intercourse at semi-annual conventions. The semi-annual convention of the Western Retail Lumbermen's Association of Saskatchewan and Manitoba will be held in Winnipeg city during the week of February 13.

THE WOODWORKER

Shaper Work

Shaper work is so seldom mentioned in the Wood-Worker, says a correspondent, that it almost seems a duty for some one to take up the subject and enlighten the youngsters who intend to do much work on this machine. This data is not meant for the ones older and wiser than myself, for I know it is a hard matter to teach an old dog new tricks, but it will probably be of some use to the beginner.

There is a diversity of opinion as to which are the best shaper cutters to do good work with. Although in some instances I favor the reversible cutter, of which very good ones are certainly made, yet to do all kinds of work, straight or bent, give me the common flat cutter every time. However, I do not mean just any kind of an old piece of flat iron filed to the required shape, but to do good work two cutters should always be made alike, with exactly the same shape to each one, so that they both do the work; and they should be exactly of the same bevel and size, so that they fit very nicely into the washers, as shown in Fig. 1. If they are not even in width and the bevel not alike, then they will not fit the washers, and on that account spring the spindle, or perhaps only one will become tight and the other one will fly out and probably do some damage; but if these cutters are made right and tempered well, they will positively do good and smooth work on straight or bent work. The thickness of the bits may vary with the size, but a piece of flat steel 5-16 in. thick will do for all ordinary work. I have found worn-out flat files make very excellent bits; especially will they work well if some of the temper is drawn out. We always have shaper bit steel on hand, ready beveled and of different widths.

Shaper Details

There are no doubt many champions of the reversible cutters (we have them in our shop), but after seeing them work and raising a smoke by burning the stock or trying to enter hardwood to make a plow, it is a wonder they should continue to use the bits. I know perfectly well that if a reversible bit is made right and kept in trim by an expert filer, it will do passably good work, but the trouble is, when the bits are not filed by a very good filer they will get too short on one side and consequently do poor work, and you cannot use them both ways, for they will burn when reversed. Again, I say, that is not the fault of the bit as much as it is the poor filing. In the time that a man will spend trying to make a plow in the above manner, I can take an ordinary flat bit and do my work quickly and without danger of "cussing my soul to perdition."

The first important thing is to have bits of the same width and well balanced. Next and more important is to fasten them very securely so that there is no danger of them flying out; especially is this necessary when using a shingle shaper, which can be reversed, and there is danger of the nut coming loose. Next, take a firm hold of your stock and feed as indicated by the arrows in Fig. 5. Never start to feed by putting the stock directly against the cutter, as shown in sketch. I have seen many a piece of work spoiled by this method of starting. I remember the case of a man who was to use the shaper for the first time. He was shown how to hold his stock and how to feed. I had no more than turned my back when he started to use his own method, and the result was a crippled hand for life. He quit the shaper from that day. By being fearless and careful, a man may work at the shaper every day without danger of being hurt, but if he is afraid of the machine and absent-minded he should stay away from the shaper. It is always a good plan to clamp a piece to the table and slide the stock along the edge; this will also serve as a chipbreaker. However, in the case of bent moldings it is best to put pins into the table and proceed as shown in Fig. 4, the pins acting as a stop.

The shaper is, in fact, a universal machine, and can be used for many purposes. In a mill where there is a great variety of molding work done, the shaper is indispensable. I have worked at it for years without getting seriously hurt at any time. This is not intended to run down the reversible cutter, but "many men, many minds." For my part, give me the flat cutter every time, and I will shape a way for myself.

Setting Up and Machining Problems

Setting up and machining problems are dealt with in an article by M. Carl in the Wood-Worker. We will assume, he says, that the machine man has a template or sticker man's rule, as shown in Fig. 1, in which the parallel lines represent knife projection measurements, each space indicating 1-8 inch.

Taking O. G. stop for example, of 1-2 inch thickness, and 1 3-8 inch wide: Begin at the cross-section "a" and measure 1 3-8 inches on the fifth line (do not count line "b", as that is the cutting knife line) at "c". Lay the cutter on and mark the cutting portion as shown. As explained in a former chapter, a knife projecting 5-8 inch cuts just 1-2 inch deep. But the O. G. knife should cut through the bed; and allowing 1-32 inch for bottom head cut, the knife must extend full that much below the line, as shown. All O. G. stop cutters should be spikes, and put on with caps.

And right now we will dispose of the question of double-cutters. I use them in but few instances. If I have to run quite a lot of rabbeted door jambs I use two rabbeting knives. Also, when running curtain pole stock, as I have had to run carload after carload of it. And where the work is unusually heavy, as running gutter, knives should run in pairs as much as possible, as it is much easier on the machine. Balance the O. G. knife againt a straight one, put them on the cutterhead, and bring the machine bed up until the O. G. knife will pass without striking when turned by hand, and you are ready to put in a piece of stock. Feed it through until the end almost reaches the bottom head.

Next comes the pressure bar problem, which is no mean thing to grapple with (or, rather, a very mean thing). There is only one way to do it right: When there is a pressure bar to make, make a good one. Then don't spoil it by changing it to suit some other pattern. As a great many moldings have one or more members that will make good bars for some other pattern, bear it in mind, and when machining one of this kind, take two or three strips of the kind of wood you make pressures of, and run them for future use. Any O. G. stop will reverse and fit, at least good enough for a pressure.

Then for this pattern take a piece and rip it as shown at "a", Fig. 2, and tack it to a piece of s.4s. of proper size, as at "b". Place the front end as near the top head as the cutters will allow, first beveling the end so it will go farther under the head, which insures smooth work to the very end of the strip. The square edge of the stop must be finished with the rail side head, and the guide on the opposite edge cannot be set against the edge of the work without spoiling it, hence the strip "a." Set the guide snugly against the edge of the pressure bar, and the work is firmly held in place, coming out smooth, clean and regular.

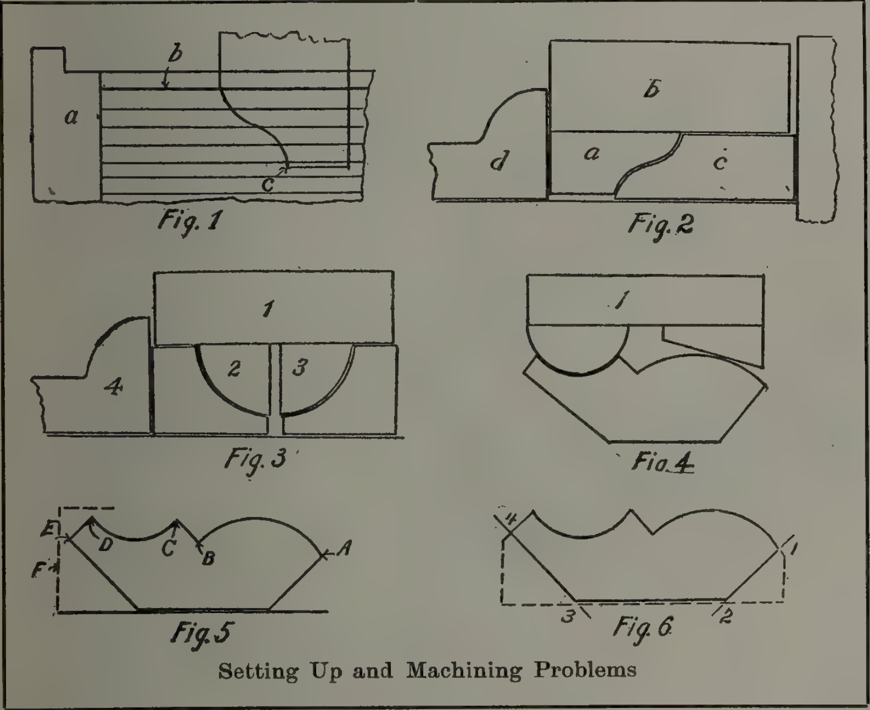
This bar is suitable for a number of widths of stop. When running quarter-rounds, half-rounds and scotias, run several good pieces of the different sizes, and lay away for pressures. They serve a multitude of purposes. When running quarter-rounds, a piece of scotia put on a heavy strip makes a good pressure, just as the quarter-round answers the same purpose for the scotia.

Some months ago "Jerry" said he was at a loss to know how to put a pressure on two strips of scotia when running them as shown in Fig. 3. Take a 1-inch strips, as 1, and two pieces of quarter-round, 2 and 3, Fig. 3, driving the brads from the top as shown, and you will have no trouble, "Jerry." Set the guide 4 against the edge which holds the strip opposite the guide 4 against the edge which holds the strip opposite the rail in place. Never drive nails from the under side of a bar as it will invariably cause it to scratch. And right there is where the sticker man "gets his." If the bar is put down too tightly, it will gather lumps and spoil the stock. And to get the proper adjustment, the stock should be passing through the machine. It requires some practice to do this properly, but the operator will soon learn what we may call the touch.

I do not know how it occurs to others, but to me there is an indescribable touch or feeling that tells me when to stop putting it down. But the conditions to be met and overcome are too numerous to cover here, and after I had told all I knew about it, you would have something occur in fifteen minutes, probably, that neither of us ever heard of.

For running the "head and cove" beds, as shown in Fig. 4, the pressure shown gives better satisfaction than any other I have used. In putting the bar on the work, it should not rest heavier on one edge than the other. To avoid this, lay the bar in place, loosen the shoes entirely, so they will set flat on the bar, then tighten them just that way. All that remains is to set them down properly. I have seen oil put on bars to keep them from scoring the work. Don't do it. In most instances it only aggravates the trouble. Tallow is allowable, but give me clean hardwood. Hard slash-grain yellow pine makes a good bar. So much for pressures at this time.

Now, suppose you were going to set to run the bed shown in Fig. 5. Measure from Ato B, and lay it off on line ",'' Fig. 1; then from B to C and C to D, extending them also on the same line. Of course, you are using sectional knives. Then one knife does the work from A to C, another section from C to D, and a stock angle knife the chamfer. Lay each section on the template corresponding with the measurements, marking around the cutting edges with a sharp pencil. This is for beginners only, as one with even a few months' experience will need only the points of measurement, and not the marks around the cutters.) The under chamfers are made with the lower head, the side heads not being used, and should not be in making beds and crowns. The stock must be held to a certain and fixed line of travel past the bottom head, in order that the chamfers do not vary. This duty should not be left entirely to the pressure bar, and a thoroughly reliable and positive remedy is by putting on a side knife and size the width on the dotted line F, so the side guide may be set up firmly, holidng the stock firm and true.



Setting Up and Machining Problems

Begin by balancing the knife cutting from A to C against cove cutter from C to D. Balance the angle knife against the side knife, and, when putting the angle knife on, drop the point E a scant 1-16 inch farther below the line "b" on the template than the actual distance in the detail. As 13-16 inch is the proper thickness for this class of stuff, project the side knife 1 1-32 inch, then bring the machine bed up, or lower the head, as required, until the side knife will pass and not strike. Now start the machine and feed a strip about 2 inches past the top head. Stop the machine, raise the feed rolls, withdraw the strip, and saw off a piece about 1 inch long. Extend the lower chamfer lines on the details as shown in Fig. 6, and fit the piece sawed off, on the detail. You will not always get the cutters just right the first trial, but the changes necessary should be so slight that a light "tap" here and there will put them in proper place. The dotted lines show the unfinished part of the piece. Hold the piece down firmly, and make a pencil dot on the block at 1, 2, 3, and 4, close down to the detail. Reverse the piece, and with the rule and pencil connect 1 and 2, and 3 and 4 across the end. Then, with a knife or chisel, trim the outer corners off true to these lines. Replace the piece against the ends from which it was sawed, mark the chamfer lines on the end, and with a hand saw rip back 1 1-2 or 2 inches true to the lines for a pattern. Feed the strip through until the end is directly over the bottom head. Set up the side guide, place the pressure bar on properly and set it down snugly, and the chamfer or angle knives can be put on quickly, so as to require no corrections, and the set is complete. The whole thing can be done in much less time than it takes to tell how it is done. I have had men to say, "Why not make a pattern, put it on a stick, and set by it?" Well, I can do all above work before he can make his pattern. He must then make his set while I am pushing good molding out of my machine.

Now, all this work is quite easy to one having a little experience, yet it requires enough of the real principle to put him on the right track for the more difficult patterns. And it is not always the big stuff that is the most difficult! Take, for instance, that old corner head No. 5086, or those return heads. They are small, but—troublesome, if you want to do a good job.

There are some patterns of hand rail that are rather tedious on account of most of the members being made with the side heads. In cases of that kind a pattern does not come amiss. When the work is the same on each edge, and templates are used, the best way to get the first set is to put knives on the first head, make a cut of 2-in. or 3-in., take a template of it, and extend member points across to the opposite edge of template with a square, and mark the kinves on for the other head.

Balancing knives is a part that requires judgment and true principles of mechanics, and to treat of it fully would require much time and space. First, one must know that a static, or standing balance is not always a running balance. If you were putting a straight knife against one that projected 1-2 inch or 1 inch, a perfect balance on the scales would be far from a running balance, so the straight knife must be enough heavier to make up for the difference in centrifugal force between the two knives; and as centrifugal force equals the continued product of .00034, the weight of the body in pounds, the radius in feet, and the square of the number of r.p.m., it is evident that a difference of 1 in. projection of knives is considerable. Knowing how much allowance to make, comes only by practice.

Another point to watch closely is getting the knives on the cutterhead so as to revolve in the same line. If they must be "dodged," counterbalances must be used to equalize the forces. For instance, if you were going to run a 4-inch crown, and put the angle knives on the bottom head, they would not come in the same line; one knife would go on almost on a line with the rail. Then turning the head half over and putting the other one on 4-inch to one side, would give bad results. Two head bolts crossed opposite to that of the knives are usually sufficient. If not, something heavier must be used.

Rip Saw Accidents

All too often we hear of deplorable and not infrequently fatal accidents in connection with rip saws. One came to the writer's attention recently, one of several of the same class that have proven fatal. A rip saw drove a piece of lumber through a man's stomach. The rip saw has quite a record of similar accidents piled up against it. They have been happening ever since the introduction of power-driven rip saws. No one man will be able to tabulate the list of fatal accidents, to say nothing of the minor ones.

There are really two general classes of rip saw accidents. In one class is the man who accidentally comes in contact with the saw with his fingers or some part of his body, and this is probably the most prolific source of minor accidents. The other general class of accidents come from saws catching strips, blocks and pieces of lumber and throwing them back at the operator. These accidents, while not so frequent, are often more serious, and not infrequently are fatal.

It is almost impossible to devise a mechanical safeguard against the carelessness that leads a man into accidentally bringing his hand or some part of his body in contact with the rip saw, but it is both possible and practical to devise a mechanical safeguard to prevent the more serious accidents caused by the saw throwing pieces back at the sawyer. There are guards that go over the saw, and where these are not available it is generally comparatively easy to suspend a board from overhead and let it hang down to the top of the saw so that it will furnish a buffer for anything thrown back, and will also prevent a stock climbing up on the saw and being thrown back.

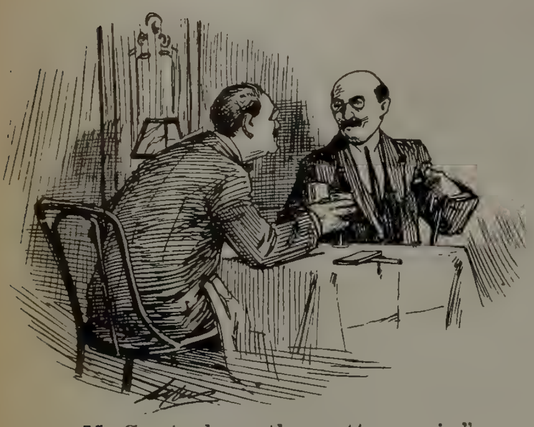
There have been enough serious accidents from this source that it looks like there would be no need to urge to-day the necessity for using safeguards. It looks like that first law of nature, self-preservation, would lead every sawyer to use them himself. The trouble is, the average sawyer feels like these things are a little bit in his way and more trouble than they are worth. He takes chances on them for a while, without accident, perhaps, then continues to take chances until he has an accident. Then there is trouble, both for the man and for the employer.

It is time for a campaign of reform in connection with rip saw practice, time to insist on such safeguards at least as will prevent them from throwing stock back. Whoever is to blame for the lack of these safeguards, employer or employe, should be given a shaking up until he comes to realize their importance and keeps them on the machines and in order all the time.—The Wood-Worker.

The Retail Dealer and His Problems

Competitive Yard Troubles A Few Samples

Jones, He Writes About Retailers.



"Mr S— took up the matter again"

Once in a while I run across a man who keeps you talking until lunch time and then directs you to the hotel, or says he has got to go to dinner and asks you to drop in later in the afternoon, but Mr. S— is not that sort. He is more apt to look at his watch and almost shout as though the flight of time was a great surprise:

"Great Scott! It's time to feed. Come, get on your hat and we'll go over to the ——— House."

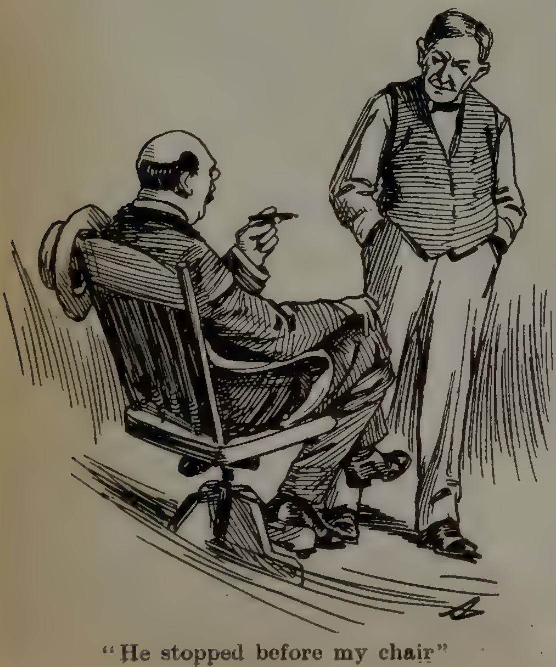
It's no use trying to get ahead of him by getting your invitation in first. When you're in his town, you're his guest. I've tried to beat him, but always lost out. Tricks that work on others don't feaze him one bit. He's simply in a class by himself when it comes to cutting in ahead on the invitation game. Of course I succumbed to the delightful inevitable and we started out. No sooner had we "named our poison" as he euphemistically termed the decoction served by the gentleman with the white apron, than he brought up a matter I had aired at some length recently. It was the personal order blank idea, but as this was likely to occupy us some little time, I suggested that we get to the table and talk it over. When we had attended to the preliminaries and were awaiting the results, Mr. S—— took up the matter again.

"That order blank stuff you put in the Lumberman a while ago was bully. I'd have been up against it good and proper if I hadn't used my own blank for a car of flooring a few weeks ago."

"Is that so? What was there to it?"

"I wanted some flooring for a job we had and it had to be very nice. A salesman happened in the very day I wanted to order it, so I wrote out the order on my own blank and put in 'steam kiln-dried.' The salesman said they could furnish it that way, and told me I could depend on getting just what I called for. Well, in a short time the car came, but I was disappointed. It was not what I had ordered, although it was nice-looking stock. I wrote the shippers and they replied that the flooring was all right and were not inclined to do anything. In my next letter to them I called their attention to my order and to the specifications for 'steam kiln-dried.' Of course there was nothing they could say. Now the point is, if I had let the salesman put the order down on his blank and merely taken his word that it would be what I wanted, I could not have held them to it. The best I could have done would have been to ask for an inspector and this would have put me to some expense."

"That's a good point for the personal order blank. How long have you used them?"



"He stopped before my chair"

"Quite a few years, and we have never had a dispute that could not be settled easily. I am careful to put in an order just what I want, and insist on getting it. You can't always get just what you want and if there is only a little that is off, I don't file a kick."

We then talked over rejected cars and I asked him what his idea was when a car is rejected.

"Here in our town, if I reject a car, the other dealers won't take it. We thing it is best to stand together on this."

"What is the wholesaler going to do with such a car on his hands?"

"That is his business. In the first place, as I said before, we don't turn a car down unless it deserves to be turned down, and the best way to teach a wholesaler a lesson is not to touch it. If he can make an allowance so that we can handle it, we might take it in, but I don't like to do that either. A rejecte dcar is a bad thing. Most every wholesaler knows of towns where they do not care so much about grades as we do and he can use it there."

"Don't you think when you all turn a car down that way it makes a man a scalper whether he wants to be one or not? My idea has always been to do all you can to help the salesman get rid of the car, and in some cases have advocated his selling it to any one who will take it."

"No, I think you are dead wrong there."

"Well, maybe I am, but there is one other thing I want to ask you about. What is your experience in taking in a car that you do not like and adjusting it afterwards?"

"All wrong. Don't touch it. Get it on your yard, and it's a mighty hard thing to get it off. I hold that its the business of the shipper to send what I order, and if he doesn't do it, it's his lookout and not mine. If he can't get stock his customers want, he had better quit. The great trouble with many wholesalers is that they don't know what the retailer is up against. If a load goes out that doesn't suit, back she comes, and we have to make it right. Our customers are right here on the ground and we can't shove any old thing off on them."

While I did not fully agree with Mr. S—— in all things, there is considerable truth in what he said. I hear of any number of cars that are not right, but am coming to believe that it is largely the retailer's fault. Business is not a charitable institution, and taking in a poor car because you hate to see a wholesaler lose on it, is not doing him any good at all. It's a common complaint that there are too many retailers, and the same can be said with equal truthfulness of the wholesalers. There are some who have no right to go into the wholesale business, and it's these fellows with not sufficient capital and lacking in knowledge of what the trade can use that create the disturbances, but so long as retailers are swayed by a concession in price, sometimes ridiculously small, the wholesaler who can't qualify will be in the trade. To be sure, the best wholesalers at times have a bad car, but take it year in and year out, the high grade wholesaler gives the best satisfaction, even if his price is not always a little under the market. The retailers, some of them at least, discourage a wholesaler by showing absolutely no appreciation of good service. When you turn such a concern down and buy of a man with his office in his hat because he cuts the price, you are gambling on getting what you want. Maybe some think they can get a greater allowance from such a man because he is usually up against a hard proposition when a car is thrown back on him, and will take almost anything. But to be perfectly frank; the wholesaler has no corner on sharp practice. Some retailers are adepts at finding fault and making demands for allowances. It is this class who refuse to arbitrate. Only a few weeks ago a salesman told me of a case with such man. They don't like to sue him because it would come before a local court and no amount of evidence that the wholesaler could produce would overcome the testimony of the people the retailer could bring in as witnesses, to bear out his contention. Some seem to be aware of this and make their claims just large enough to sting, but not large enough to warrant legal proceedings. The retailers ought to co-operate to spot the unscrupulous wholesaler, and, on the other hand, the wholesalers ought to list each one of these chaps who won't arbitrate and when they want anything more, just throw their order away. It would teach them a lesson that might bring them to their senses.

"The other thing happened only yesterday—"

The other day I stumbled onto the makings of as nice a local scrap as I often run across. I was scouting over some new territory and stopped off at D—— and called on Mr. Bryant. We slid over the usual greetings all right and then I started out to learn something of local conditions.

"I suppose you've had a good year, Mr. Bryant?"

"Oh, about so-so. Business ain't what it ought to be, but I can't complain."

"How about outside competition. You've got it all your own way here in D——, but we passed a little town back a few miles and I noticed quite a stock of lumber. Do they come in here much?"

When you begin to interview a man, you always watch to see how he takes a question. If he answers it in a matter of fact way, you won't strike pay dirt there, but at my reference to this other yard, I saw a change come over Mr. Bryant's face and felt I was following up a good lead. I will be honest and admit at the start that I am toning down his comments, but I think the gist of what he said remains.

"Only lately. Up to this fall we got along fine, but a couple of deals have come up this month that I don't like."

"What's got into them? Maybe business is dull and they have got to get out and hustle."

"It ain't that. The trouble's right here. Mr. W——, who owns the yard, is getting along in years and this fall turned the business over to his son-in-law. The old man and I never had any trouble. Mr. D——, that's the son-in-law, wants to make good, and thinks the only way to do it is to sell all the lumber in the county."

By this time Mr. Bryant was getting warmed up and walked around the office to work off some of his feeling. I sat tight and smoked, feeling sure I would not have to wait long. After a few turns around the room, he stopped before my chair.

"I don't mind telling you about it, and maybe you can tell me the way to handle him. I hate to get into a scrap. I've lived too long to think there's any money in scrapping, and won't do it if it can be helped, but I ain't going to sit still and see my trade going over to S——. We have as good a stock as they have and only myself to get a living out of the business, while they have two, so if it comes to a show-down, I can stand it as long as they can."

"Why don't you drive over to S—— and have it out? See the old man and its dollars to doughnuts he will fix it up."

Mr. Bryant paid no attention to my remark, but went right on.

"The son-in-law is a nice sort of a fellow. One day he came in here. Said he wanted to get acquainted and see if we couldn't work together because his yard was so near mine. I told him that was the way Mr. W—— and I always got along and I saw no reason why he and I couldn't do the same. The long and short of it was that we agreed to telephone each other whenever our customers went to the other fellow's yard. Well, the very next day he did telephone me about a little order that did not amount to anything, but I thought he meant to tote fair, and was glad to see it. A couple of weeks went by when one of our contractors came to me about a job he was figuring on—it was for three houses. I knew the party so went to see him, and I know if I had not done so, this contractor wouldn't have got the job. I felt as sure of selling the lumber as if I had the order already booked, but did not hear from him. One day I met him and said, 'Dan, how about that order? We'd better get it placed so there won't be any delay.' He told me I was out of it, for the yard at S—— had beat me nearly five hundred dollars. This riled me for I had figured close. I had to, for the contractor had not made his bid high. The other thing happened only yesterday. I was down the street and saw one of my customers, a farmer, out on the other side of the town, driving by with a load of shingles and some roof boards. He had gone right by me without even asking for a price, but they never telephoned me at all. Now, it stands to reason that a man won't drive ten miles if he don't get a pretty good price. You know how the farmers are—they won't keep still about a thing like that, but it will be all over the county in less than a week, and every mother's son of them will go to S——. Now, I haven't solicited any trade from his customers, and have always kept about half way from there. How did the farmer know about them if he had not been seen, or got a circular? It looks to me as if that fellow means to bamboozle me by telephoning about little orders that don't amount to anything, and go right after the big ones, but he can't fool me. I'm onto his game."

"You are right about not wanting to start a scrap, but it is a hard case just the same. I'd go over and see them, anyway. It won't do any harm, and if he knows you're onto his curves he may come to his senses. You know it's hard when a man drives in and planks down the money to tell him to go back to his own town and buy. If you do that, he will begin shouting about a lumber trust and all that tommyrot, so sometimes it is better to say nothing and take your medicine, but don't forget to go and see them. I once knew of a man of this sort who was converted by getting up a local organization and making him president. It sounds fishy, but it's true. There were only about ten dealers interested, but they filled him as full of good fellowship and the idea of co-operation that he flopped right over and is the best kind of competitor now."

I'm going to watch that case and possibly may learn something worth telling the readers of the "Lumberman." It may set some thinking who are inclined to stir up a neighborhood row just to know the incidents I have given, for they are only too true. I wish they were wholly imaginery.—The Southern Lumberman.

Birch c.i.f. values at Liverpool are firmer and spot values are following suit. There is an especially good demand for logs, especially Quebec and St. John shipments, which are readily sold ex quay. Further advance, however, might interfere considerably with trade. Planks are in fair demand but present prices are rather stiff for consumers and the trade is, accordingly, largely of a hand-to-mouth order. The favorite thicknesses are very scarce. Stocks of birch are depleted and spot prices are likely to increase.

The c.i.f. market for Quebec pine is very firm and advances are expected for next season's goods. It is certain that the better qualities will at least hold their own at higher prices. The spot market prices are steady with a tendency towards advance for the higher qualities. It would be difficult, however, to advance the lower grades. Quebec red pine is firmer with a steady demand. In this case, however, further advances are not to be expected without interfering with trade. Stocks are reported to be ample for present requirements. Softwood shipments of late have been light.

At Manchester, the outlook for trade is fairly promising. Floorings, however, are going rather slowly and there is difficulty in obtaining £10 2s. 6d., c.i.f., for unassorted. Unless trade improves, a decline is more probable than an advance. The timber trade in the west of Scotland showed quite a strenuous movement during the closing days of 1910, which indicates that buyers are expecting an improvement in business during the new year.

Lumber Trade Calenders

Wistar, Underhill & Company, wholesale lumber dealers, Real Estate Trust Building, Philadelphia, Pa., have favored their friends with a very useful calendar, upon the pad of which are separate sheets for each week of the year. Each business day of the week has a large white square, upon which business engagements may be handily jotted down. The pad is mounted upon a tastefully designed red board with a white border.

John Donogh & Co., Traders Bank Chambers, Toronto, have used for their 1911 calendar the interesting decorative scheme which they adopted last year. This consists of a number of colored reproductions of photographs, which gives a graphic illustration of the story of a tree from the time when the woodsmen commence to saw it until it arrives at the mill to be turned into lumber. The calendar pad is a large one, with an attractive border design. Those who are fortunate enough to be among the company's friends will welcome the arrival of this annual visitor.

A splendidly colored illustration of a forest fire adorns the calendar issued by the Campbell-Maclaurin Lumber Company, Board of Trade Building, Montreal. The scene is extremely realistic and gives an awe-inspiring idea of the incalculable damage done by the great enemy of the forest. As to the calendar itself, it is welcome, not only on account of the illustration, but because of the very large calendar pad which it contains. The Campbell-McLaurin Lumber Company deals in "Everything in Spruce."

The Thomas Nagle Lumber Company, Limited, Globe-Atlantic Building, St. John, N.B., and 180 St. James street, Montreal, Que., have distributed among their friends a calendar, which for its artistic design will rank among the most succesful of the new year. The decoration consists of a reproduction of a painting of a lady's head by Altson, an Australian artist. It would be folly to try to describe this beautiful picture, in order to appreciate it, one must see the calendar itself. The picture is surrounded by an attractive design in a relief effect, and the color scheme in both calendar and picture is very pleasing.

John Dulweber & Co., dealers in hardwood lumber, Cincinnati, Ohio, have favored the CANADA LUMBERMAN with one of the most attractive calendars that have been issued for the year 1911. The design of the calendar is a colored picture of a girl's head, a reproduction of a painting by the well-known artist, Mr. Harrison Fisher. The title of the picture is "Miss Aristocrat," and it is said to be one of the very best pieces of work that this famous artist has produced. The picture is handsomely mounted on a light blue card, and the mount is covered with white art paper giving the effect of a white frame with a blue border. The calendar pad is attractively printed and hung beneath the picture. The John Dulweber & Co. are to be congratulated upon their fine souvenir.

The firm heretofore carrying on business at Penetanguishene and Sarnia, Ont., under the name of F. McGibbon & Sons has been dissolved. The Penetanguishene business will be continued by Mr. Charles McGibbon under the firm name of the McGibbon Lumber Company.

The death occurred on December 24 at Sherbrooke, P.Q., of Mr. Charles P. Charlton, superintendent of the Iberville Lumber Company. Mr. Charlton was only ill for a very short time and his death was unexpected.

CAMP DEPARTMENT

Keeping Fire Out of The Limits

The lumbermen's interest in forest legislation was the title of a practical address by T. A. Green, of Ontanogon, Michigan, at the Lakes States Forest Fire Conference. Mr. Green's remarks were in part as follows:—

A brief description of how a lumberman makes money from our forests may not be without interest. Assume he has paid fifteen thousand dollars for a group of timber, and upon cutting it and after paying all the bills and selling his lumber he has seventeen thousand dollars. Then he finds he needs more timber. He tries to replace the acreage he has cut, and is compelled to pay seventeen thousand dollars for it, just what he took out of the first tract. This performance is repeated year after year in the hope that future manufacturing pofits may be larger. He rarely makes a dollar sawing lumber and often loses. If he manages to wind up his operation with about as much timber as he started with, he makes money, because of the natural increase in timber values. If some of the timber land left has been burned over, the operation will likely show a loss and not a gain. The lumber business is largely one of book profits to-day. Cash dividends do not come with regularity.

These are some of the reasons why the lumbermen are interested in laws for the protection of forests, but I do not mean to imply that they alone are interested. The entire country is aroused to the necessity for action. It has been difficult, in the past, to convince the residents of the unforested parts of the Lake States that they have a common interest with the lumbermen in the protection of the forests. They are beginning to understand that the lumbermen are less interested in protecting the remaining forests than they are. The owners have an average value in their stumpage of about two dollars and a half a thousand, and they disburse, in the process of reducing the tree to a marketable product, about four times that amount.

The public, realizing, at last, that the wanton destruction of the forests means a distinct loss to every one, demands that something be done. Such vast resources have been destroyed by fire in recent years, coupled with a heavy loss of life, that the people will not be denied. There is only one way open to them—the law. New laws and amendments to existing laws are proposed on every hand. Some of them single out the lumbermen as the scapegoats, a few place the burden upon the railroads. The records of Forester Griffith, of Wisconsin, show that 60 per cent. of all the fires in the five years preceding 1910 were set by homesteaders, 15 per cent. by railroads, and 25 per cent. by campers, careless hunters and others, including the lumbermen. It seems probable that the number of fires for which the lumber companies are directly responsible are not many. Few people respect the forests as they should. Some abuse the railroads for setting fires, and then throw lighted cigars and cigarettes from car windows in dry seasons. There is altogether too much carelessness. Fire is a terrible scourge. It is not to be played with.

The experience and training of average lumbermen should enable them to be the best judges of what is practical legislation for the protection of forests from fire, while the people in general are not well informed on these matters.

The Minnesota law passed at the last session of the legislature that provided for the burning of the slashings left by the lumbermen has proved to be impractical, in fact, very dangerous. An attempt to burn slashings by a large operator during the past season resulted in the burning of two hundred million feet of white pine.

Men have said in public that the lumbermen should not be allowed to make any slashings. While such a demand is ridiculous it is no more so than a general slash burning law would be. Advocates of such a law surely do not realize what they propose to make the lumbermen do. They have not stopped to think that very few people own solid blocks of timber, that there may be neighbors who may be completely surrounded by slashings. The days when slashings of that kind, in most timber, could be fired without damage to the adjoining stumpage would be few and far between. In fact, at no time during the summer months is it safe to set large fires, for when once started they creep into the roots and moss and smoulder for weeks, so that a high wind may fan them to a blaze at any time. These ground fires have been known to last from mid-summer until snow-fall, and even through the winter. Some will suggest waiting until winter to burn cut-over land. The early part of the winter finds the fuel too wet and later the snow too deep, in many parts of the Lake States.

In mixed timber there are many small trees and defective matured trees left after logging. In a few localities the immature trees may become valuable timber stands if allowed to grow. Nearly all the timber remaining standing is valuable for wood, and is the chief source of survival of the settlers during the first years they occupy their farms. My own personal experience leads to the belief that this valuable remainder can not be saved where slashings are burned.

In the hemlock forests the bark must be peeled in June, July and August and often a year's supply of logs is cut then. Long before winter comes those slashings are as dry and dangerous as any. Where the hemlock and hardwood timber stands thick upon the ground, a great deal of small timber will be killed by the heat when the land is burned over. Even where great care is exercised such will be the result. In a very large number of cases there is more fuel for fires a second year than there was at the first burning. This is not true of solid pine stands, but Michigan and Wisconsin have very little of that kind of timber left. The burning of slashings in any case only relieves the situation temporarily, for no one fire will take the stumps and old wet logs, which, when rotted, burn like tinder, and these, together with the brakes, wintergreens and other vegetation that naturally springs up in all burned districts finds a fire as quickly and as surely as the original slashing. Many remedies considered impractical might be of value if the average labor that can be found for the work could be relied upon to use judgment and care. That class of labor seems to have almost disappeared from the earth. The cost of burning the slashings must not be lost sight of, because any added expense will prove ruinous to a large number of lumber manufacturers at this time.

Without question, the only cheap way to burn slashings in general is to set fires to large areas and allow the fire to run before the wind. Any one making a practice of burning that way will hardly be regarded as a good neighbor. If slashings are to be burned they must be burned with great care. In heavy mixed timber the cost will then be prohibitive.

But we will all admit that something must be done and at once. In the first place the timber owners must help themselves, after that they may expect some help from others.

A thorough private patrol backed by a law like that proposed for Wisconsin, under which teh state would provide a regular patrolman for every forty thousand acres or less of forest land, will go a long way towards eliminating fires. The only laws that will be of any avail will be those that will help the state and private owners do that work.

There should be no rigid laws providing that certain things must be done regardless of locality. The conditions are often very different in adjoining geographical townships. What is feasible in one county may prove otherwise in the next. It would seem as though able comsions, as far as possible non-political, clothed with the necessary authority could best handle this matter.

Experience has taught the forester that the best way to prevent fires from spreading is by clearing out paths or fire lines. It is possible that the clearing up of a strip of land a few rods wide between the slashings and the timber may help to keep fires within small areas. If that plan was adopted and the lumbermen were compelled to cut the tall dead timber of any variety for a certain distance back from the fire lines, at the same time that they cut the sound trees, and a good system of patrol was put in force, I feel quite certain that large fires would be a thing of the past. The cleared lanes around slashings would make access to fires much easier than it is to-day. Fires are more easily prevented than stopped. If they do start get to them as soon as possible and put them out when they are small.

The meat of the nut is an active campaign on the part of every one to prevent fires and quick action if they start. In this matter an ounce of prevention is worth a pound of cure.

Hon. J. K. Fleming, provincial secretary of New Brunswick, reports that the lumbermen of the province are at present in a bad way owing to the scarcity of snow. Unless there is a heavy fall within the very near future he expects operations to be tied up. Everything was in readiness for yarding and this could not be carried on without snow.

The Dominion Land Department has seized and will sell by public auction, the timber cut along the right-of-way of the Alberta & Great Waterways Railway, on which 80 per cent. of the timber dues for permits still remain unpaid. The majority of the permits are held by the Empire Supply Company, of which the head is Dr. McInnis, of Edmonton, but the larger part of the actual work has been done by small jobbers. None of the permits have been paid in full, nor any steps taken to use the timber, and it still lies where it was piled early last year.

The ninth annual meeting of the Hardwood Manufacturers' Association of the United States will be held at The Hotel Sinton, Cincinnati, Ohio, on January 31 and February 1. In order to keep all the members mindful of the date, the association has sent out blooting paper calendars for the month of January with the date plainly marked in red ink.

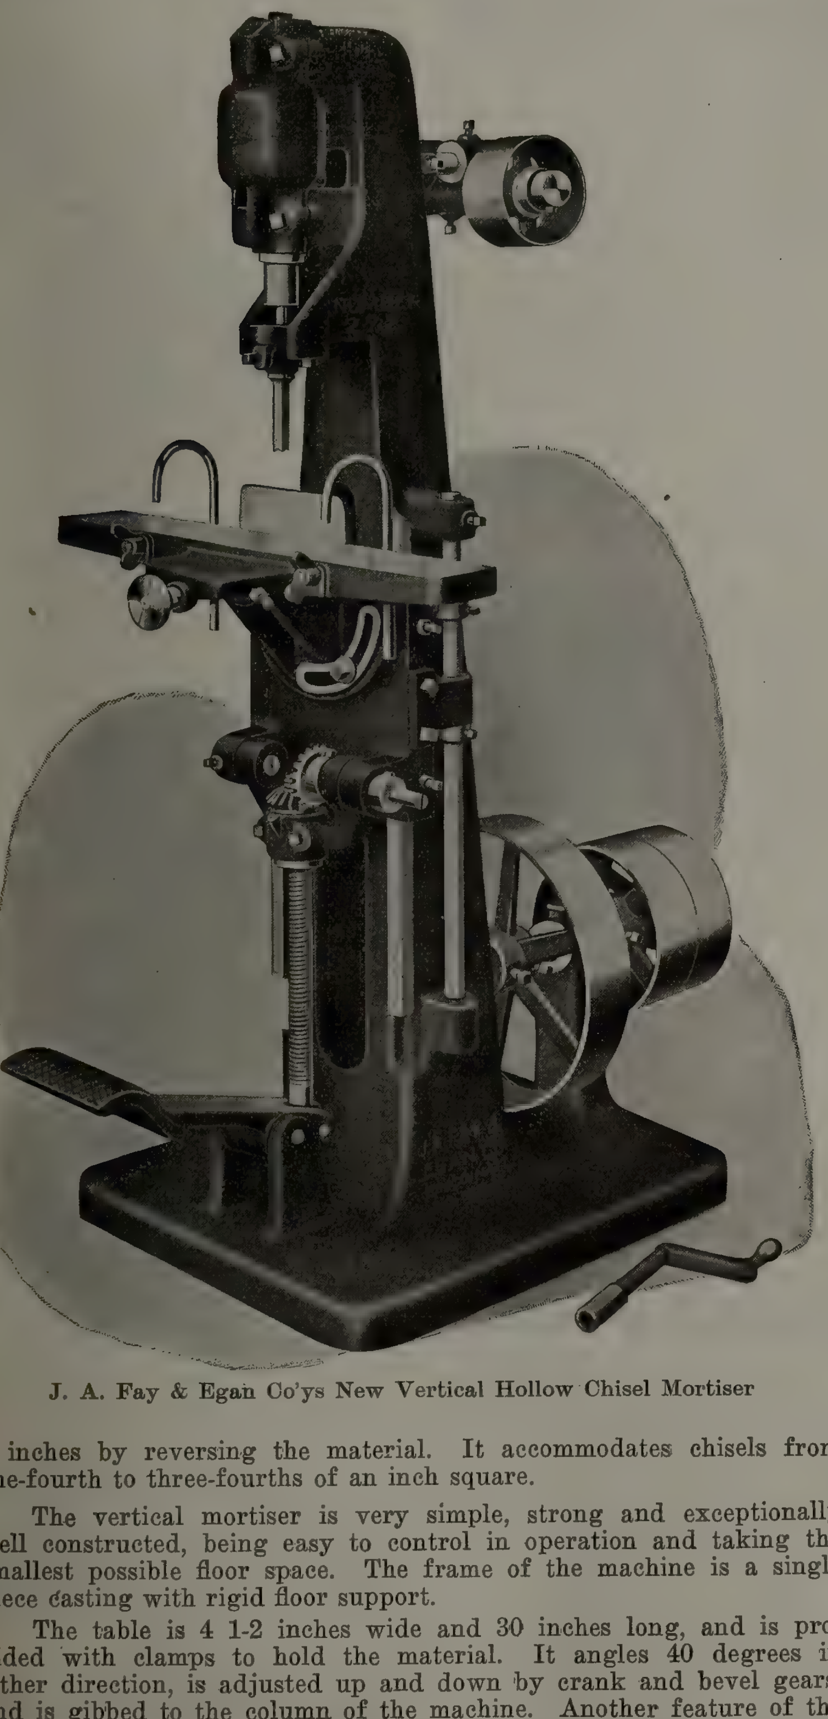
Machinery and Equipment

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

A Handy Tool

We take pleasure in illustrating a new vertical hollow chisel mortiser, manufactured by the well-known firm, J. A Fay & Egan Co., 465-485 West Front street, Cincinnati, Ohio.

This machine is described as being very handy and capable, for the class of work intended. It will mortise to a depth of 3 inches or 6 inches by reversing the material. It accommodates chisels from one-fourth to three-fourths of an inch square.



J. A. Fay & Egan Co'ys New Vertical Hollow Chisel Mortiser

The vertical mortiser is very simple, strong and exceptionally well constructed, being easy to control in operation and taking the smallest possible floor space. The frame of the machine is a single piece casting with rigid floor support.

The table is 4 1-2 inches wide and 30 inches long, and is provided with clamps to hold the material. It angles 40 degrees in either direction, is adjusted up and down by crank and bevel gears, and is gibbed to the column of the machine. Another feature of the table is that it is provided with a check rod to regulate the depth of mortise. The material is brought up to the chisel by foot power. The chisel mandrel is made of the best grade of crucible steel, it is claimed, and runs in self oiling bearings lined with babbitt.

This vertical hollow chisel mortiser is only one of the many woodworking machines made by this company, and, like the others, is an important factor in the woodworking industries. Readers are invited by the manufacturers to write for their large illustrated circular.

Catalogue of New Defiance Machines

The Defiance Machine Works, Defiance, Ohio, have issued an illustrated and descriptive catalogue, No. 200, covering their complete line of modern American woodworking machines. The book is designed to be of the utmost possible value to users of woodworking machinery and to all who are interested in the development of the woodworking industry. Its illustrations in every case afford a splendid idea of the machines, and the descriptive matter gives one a clear appreciation of the varied uses to which the machines can be put. The catalogue consists of over 500 pages. It is substantially bound so as to withstand continued and hard usage. The company have also issued a domestic price list, No. 200, to accompany the catalogue, giving prices of all the machines described therein. Taking the catalogue and the price list together they provide an ideal equipment for the salesman and also will be found an indispensible adjunct to every user and dealer in woodworking machinery.

Henry Disston & Sons Issue Valuable Catalogue

Henry Disston & Sons, Incorporated, Philadelphia, Pa., have commenced the New Year by issuing a very complete and valuable catalogue of their products. This publication is one of the handsomest and most thorough catalogues that one could imagine. Every page contains a number of illustrations splendidly arranged, and descriptive matter relating to the articles shown. As an indication of the excellent quality of everything produced by this company, the catalogue in itself will be an excellent advertisement. For seventy-one years the Disston Company have been in the habit of conducting all their business in just such a manner as this catalogue indicates, and the result is that they have stood prominently before the world as exponents of the value of turning out products of the highest quality. The "Hardware" edition of this catalogue covers their full line. For the mill trade they have issued a separate catalogue covering about the first half of the Hardware edition and dealing with circular, band and cross-cut saws, tools for the mill, files, etc. In addition to this they will shortly be distributing a pocket edition of their Hardware catalogue which will be a fac-simile of the former in every respect.

The A. K. Williams Machinery Company of Toronto have opened a branch at St John, N.B., to meet the demand of their increasing trade in woodworking machinery of all kinds in the Maritime Provinces. Mr. M. Doherty formerly of the Sussex Machinery Company, will be in charge.

The death occurred recently at his home at South Nyack-on-Hudson, N.Y., of Joshua Oldham, the founder of the widely-known firm of saw manufacturers, Joshua Oldham & Sons, of Brooklyn, N.Y. Death resulted from pneumonia, following an operation. Mr. Oldham's six sons, all of whom are connected with the company, will carry on its business as formerly.

The Rothfus-Howard Iron Works of Williamsport Pa. have selected a very dainty design for their January calendar. The illustration represents a young lady in a bowling alley and is very tastefully designed both as to color effect and drawing.

The B. Greening Wire Co., Hamilton, Ont., have favored the CANADA LUMBERMAN with a copy of their annual calendar. In design this calendar is similar to those for which the company have become so well known in the past, but there is an additional interesting feature to the 1911 calendar, in the fact that it now contains portraits of four generations of the Greening family. The latest addition is H. B. Greening, who occupies the position of managing director. Mr. S. O. Greening, president of the company, has occupied this position since its incorporation in 1889.

It is often a pleasure, to one who is so inclined, to tinker with an old machine and make it do good work but he shouldn't delude himself with the idea that he is working, when he is only playing.

Don't abuse the man that made the machine till you know it's his fault; even then it won't help matters.

WANTED & FOR SALE DEPARTMENT

PUBLISHERS' NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Employment Wanted" will be inserted at the rate of one cent a word. net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies.

Advertisements of "Employees Wanted" will be inserted at the rate of two cents a word net. Cash must accompany the order.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

WANTED—LUMBER, ETC.

WANTED

THREE CARS 2" TAMARAC LARGELY 6" & 8" wide & 14 & 16 ft. long. Box 183 CANADA LUMBERMAN, Toronto, Ont. 2-2

Wanted to Buy for Cash

WOOD SLABS AND EDGINGS, IN ANY quantity. C. E. FIZETTE, 265 Davenport Road, Toronto. 1-4

Logs Wanted

WANTED CORRESPONDENCE WITH parties having saw logs of all kinds for sale on the shores of Georgian Bay. ADDRESS Box 182 CANADA LUMBERMAN, Toronto, Ont. 2-2

Lumber Wanted

SHORT LUMBER WANTED CUT TO SIZE ex waste, also long lumber of all kinds. Send samples and prices JENNINGS & Co., Timber Importers, Pennywell Road, Bristol, England. 2-t. f.

Lumber Wanted

WISH TO BUY OR CONTRACT FOR Spruce and Hemlock lumber, Pine and Spruce Lath and Cedar Shingles. Send full particulars to Box 180 CANADA LUMBERMAN, Toronto, Ont. 2-5

Cedar Posts Wanted

WANTED FROM TWO TO FOUR CARS Cedar Posts from 3 to 5 inches top end. Name best cash price and point of Shipment. Apply Box 195, Jordan, Ont. f.

Pump Squares Wanted

WE REQUIRE 5" x 5" AND 6" x 6" QUARTER cut White Pine Pump Squares Good price for the right material. ONTARIO WIND ENGINE AND PUMP CO., LIMITED, Toronto, Ont. 1-4

WANTED

ONE TO TWO MILLION FEET OF BASSwood, Elm, Ash. Pine and Cedar logs and ties delivered to Georgian Bay, on North Shore or Manitoulin Island. State price and quality expected. Box 177, CANADA LUMBERMAM, Toronto, Ont. 1-tf.

Logs Wanted

WE WANT LOGS FOR EARLY SPRING sawing in our Penetang Mill, capacity 120 m. feet per day, lowest insurance rate on Bay, best results as to grade sawing, and economy of material. THE FIRSTBROOK BOX CO., LIMITED, Toronto, Ont. 1-4

Wanted
Two Million Hard Maple Lumber

1 INCH TO 4 INCH THICK FOR SHIPMENT soon as dry or can accept quantity soon as sawn. Spot cash. Inspection at mill. Apply for further particulars to Box 164, CANADA LUMBERMAN, Toronto, Ont. 4

Wanted Birch, Spruce, Basswood

WE DESIRE TO CONTRACT FOR THE whole output of your mill in good Birch, Spruce and Basswood lumber sawn to our order. Let us know what you have and if quantities are reasonably large we will send our man to look over your logs and mill. BARTRAM BROS. Limited, Ottawa, Ont. 2-7

WE WANT TO PURCHASE DRY SOFT Elm, black Ash, Basswood and Birch in car lots of each. Also a few cars of 6/4 and 8/4 Birch, No. 1 and 2 Common, for immediate shipment.

Will also contract for present winter cut of all kinds. Give full particulars, and address, THE LONDON LUMBER CO., London, Ont. 2

SIX HUNDRED ACRES, WELL COVERED with Spruce and other Pulpwoods, also in a promising Mineral Belt.

Being held in fee simple; there are no restrictions as to export, and being close to Lake Superior and intersected by the Canadian Pacific Railway it offers great convenience for shipping. For quick Sale to close an estate. Special price quoted.

tf. WILLIAMSON, Publisher, Toronto.

The Working Qualities of Mahogany

There has existed for many years a general impression that mahogany is about the most difficult wood to work there is, since it is so heavy and hard. In connection with the early history of this beautiful wood has always been related the story of how the English doctor wished to use mahogany in decorating his house, but the workmen refused to cut the lumber, saying that it was so hard that it ruined their tools. People have learned since, however, that this was a mistaken idea, and they know now that plain mahogany is about as easy to work as any of the plain hardwoods. When the wood is old and thoroughly dry it gets hard and heavy after being treated with finish. Plain mahogany, however, is fairly easy to work, and it has an advantage which is greatly appreciated by users—it gives little trouble from swelling and shrinking. The wood takes an excellent finish. It is not inclined to split and sliver and is really easier to work on machines or even with plain tools than hard dry oak.

There are so many different species of mahogany that even an expert finds difficulty in recognizing them. Certain varieties blend so closely with Spanish cedar that it is often difficult to tell whether a piece of lumber is the cedar seen in cigar boxes or mahogany. This species is the kind that is easiest to work, as it has a plain straight grain and texture like Spanish cedar. Of course the wood of the variety which is a deeper red in color is curly, with burls and involved figure and often much cross-grain, and is more difficult to work, but this is no harder than the same kind of figure or grain in oak or maple and really not so hard, as it is less liable to split. More care is needed and more time must be taken in working a piece of curly or figured mahogany than the plain stock, because of the cross grain, and also for the reason that as a general thing wood of this sort is intended for a higher grade of polish. Crotch mahogany, the figure in which frequently presents practically an end wood for the face, is often a trying proposition to the worker, but it would be just as difficult to handle oak or maple which presented end wood in this way. Since mahogany is such a beautiful wood and its tones are enhanced with age, the difficulties it presents in working are entirely offset by these advantages.

Teak for Interior Furnishings

For a thousand years or more in China, as well as other parts of the Orient, teak has been the highest-prized wood for furniture, shrines and religious objects. The famous blackwood furniture of that part of the world is made of Siam or Java teak. In Europe, more especially in England, the highest class of bank fixtures have been invariably made of teak wood. In the southern part of California, in Los Angeles, San Diego, Pasadena, and thereabouts, teak is now being used in a large number of the magnificent mansions erected by wealthy eastern people in that section, so aptly termed the millionaire's playground. In the majority of these palaces teak wood is used for interior finishings, staircases, etc., with artistic specially designed teak furniture to match. One beautiful new residence is being fitted up with doors, wainscotting, beamed ceilings and floors of teak, and hand-carved furniture of the same wood. One of the San Francisco furniture makers is busy at the present time on a large order of special designs in teakwood furniture for one of the wealthiest and best known families. The members of this family have always possessed the most correct taste in matters of art, and a number of the designs were drawn by the two talented young daughters of the house.

Australian Lumber Ties for America

A shipment of 70,000 railways ties of "stringy bark" (Eucalptus obliqua), sometimes termed Tasmanian oak, left Hobart for the United States at the end of October. Two similar shipments will follow, probably in March and June of 1911, making a total of 210,000 sleepers of Tasmanian timber for the United States.

Stringy bark is much in demand for railway sleepers, being nearly everlasting. Some forest tramways in use by Tasmanian sawmills were laid with stringy-bark sleepers more than fifty years ago, and they are still perfectly sound, after withstanding an enormous heavy timber traffic daily. The average use of these sleepers resting on gravel ballast and subjected to a rainfall varying between 20 and 60 inches per annum is about fifteen years, but they have been taken up after twenty years of use and found perfectly sound. The wood, being practically non-inflammable, makes a valuable safeguard against conflagrations in tunnels, and is especially suitable for underground railways. Stringy bark is marvelously non-absorbent and resistant of damp, making some of the finest railway sleepers in the world, and is comparatively immune from the ravages of white ants and other land insects.

The Tasmanian wood being hard, bedplates are not required under the rails of the Vignoles section of rail. The holding for spikes is good and the splitting of a sleeper is a rare occurrence. On the Tasmanian main line (3-foot 6-inch gauge) stringy bark sleepers are used. The alignment of the track is very sinuous, many of the curves being only 330 radius, and yet even on these sharp curves so great is the holding power of the spikes in the sleepers that no bearing plates or re-enforcing braces are used.

Stringy bark is especially suitable for harbor construction, being one of the densest timbers in the world and immune from the attacks of marine insects. It is one of the few kinds which can be obtained in great lengths and contains a resinous substance which resists the Xylophages. There is an essential oil in the wood which prevents it rotting under exposure to moisture, and at the same time acts as a preservative to iron. It stands great exposure to heat and damp, besides possessing the valuable property of repelling the white ant and teredo worm.

This timber is of great value in building breakwaters, docks, etc., as its high specific gravity is such that it is unnecessary to weight the piles to get them into position when in deep water, thus saving a great expense. As an instance of the durability of stringy bark when used for piles, a sample of this wood was recently taken from a Hobart pier. It was certified to by the engineer of the Hobart marine board; after being under the water for thirty to forty years it was still perfectly sound.

Review of Current Trade Conditions

Ontario

Although there is very little business in actual progress at present the indications are considered satisfactory by most of the manufacturers and wholesalers. In the first place the stocks in the retail yards throughout Ontario are smaller than is usual at this time of year and there are indications that the retailers will, in the near future, be coming into the market with fair sized orders for their spring trade. From the United States side of the line the indications are also fairly promising. Enquiries which have been received so far give an impression that there will soon be a fair amount of business under way. The clearing of the political atmosphere on the other side has gone some way towards giving dealers a better idea of where they are at, so that there is already appearing a tendency to place orders. Enquiries from the other side are already making their appearance.

The mills in Ontario are also in fairly good condition to handle trade. The year which has passed, though not any too good from the profit point of view, has been one in which most of the mills were able to make good progress in the matter of clearing up stocks. They are therefore much better able than usual to figure on the business for the coming year.

There is, even at present, a fair amount of trade filtering through, which is coming along without any drumming up. The recent advance in the price of shingles is being maintained, but the amount of business is very small, as is usual at this time of year. Fir timbers have recently been advanced a dollar a thousand.

The hardwood business is in much the same condition as the other branches. There has been a little business in progress throughout the last fortnight, but generally speaking the trade has been of a strictly holiday nature. Wholesalers are devoting their time to purchases for the future and are not giving much attention to selling. Trade is generally believed to be improving, however, and quite a number of enquiries are reported. Usually enquiries do not commence until the middle of January at the earliest, so that the arrival of enquiries early in the year is looked upon as a favorable sign. A traveller who has been visiting the Western Ontario trade, reports that enquiries from that section are quite numerous. As to the American situation very little is known as yet. There is, however, some reason to expect that it will shortly commence to show life.

In Northern Ontario, operators report that in most localities the winter has been a favorable one so far, for woods operations. There was plenty of frost and a good quantity of snow during the early part of the winter, and the roads are in good condition for hauling.

Eastern Canada

The spruce situation at Boston, U.S.A., shows a little change and not much life, as retail merchants have been paying atention to stock taking. Several buyers, however, state that as soon as they have figured on their stocks they will place orders for several cars. Offerings are light. Frames are selling in some cases at $23 but the general price is $22.50. Random is quiet and prices show a tendency towards being easier. Offerings are fairly plentiful. The demand for hemlock at Boston has been lifeless of late. Buyers' stocks seem to be plentiful and manufacturers are not pressing sales. Eastern random is quiet at $18 to $18.50 and for eastern clipped some are asking $19. The demand for shingles at Boston is slow. Dealers are keeping prices steady. A few of the manufacturers are still asking $3.40 for cedar extras, but actual prices are more in the neighborhood of $3.15 to $3.25. There is a moderate demand for clears. Very little new business in lath is reported and prices are a shade easier. For 1 5-8-inch the price quoted ranges from $3.85 to $3.90, and for 1 1-2-inch from $3.45 to $3.50. At New York, the demand for eastern spruce is dull and arrivals are plentiful. There is a fair demand for hemlock and the prospects are more encouraging.

Great Britain

No change has taken place of late in c.i.f. values of spruce deals at west coast points, nor are there any indications of an important change in the near future. Usually, at this time of year, a sharp decline occurs on account of the difficulty of placing liner parcels on consignment. Arrivals of this nature have, however, been lighter than usual and prices have held their own. Importers indeed seem to have considerable faith regarding the market for the next few months, if contracts already made for liner shipments are a good indication. The holiday season interfered considerably with trade. A good many of the wholesalers at Liverpool, in fact, decided not to send out their travellers until the second week in January. Recent arrivals of spruce deal parcels at Liverpool were still on the quay at last reports, with the sellers holding out for higher prices. Wholesale buyers, however, are anxious to have a better idea of their stocks on hand before increasing their purchases. They are fully aware, however, that the cost of production in Nova Scotia and New Brunswick has increased extensively of late and that these conditions justify higher prices. The indications are that prices will at least be firm if not higher during the coming season, although a good deal depends upon the competition of Riga whitewood deals. A factor in favor of the Canadian product, however, is the unfailing regularity with which engagements are fulfilled. The spot spruce market was as usual very quiet during the holidays. If the c.i.f. market continues strong, however, spot prices will advance slightly as recent quotations show no workable profit for the importer. Stocks are slightly over the average, which interferes to some extent with the disposal of shipments ex quay.

United States

The conclusion of the inventory season leads wholesalers and retailers generally in the northern states to expect that business will shortly become much more active. During the past year trade has been fairly extensive and profits small. Country trade already shows signs of improving and retailers' stocks are reported in many quarters to be badly broken. Receipts of lumber at Chicago for the last week of December amounted to nearly 28 million feet as against nearly 36 million for the corresponding week of 1909. The total receipts for the year showed a decrease of 65 million feet from those of 1909, aggregating 962,776,000 feet.

There is no change to record in the situation of northern pine at Chicago. The demand is quiet and orders for straight cars are very scarce. Prices are being well maintained, especially for the upper grades. There has been a fairly good call for hemlock at Chicago from retailers who are laying in a good assortment for spring trade. The demand seems to continue pretty active and a steady market is expected during the opening months of the year. The indication is that the output of logs this winter will be very heavy and that stocks of dry lumber will be well cleaned up before the new cut is ready. Pacific coast woods at Chicago are very quiet, there being only a light call for spruce and cedar. The enquiry for fir is improving. Southern pine representatives at Chicago are feeling more confident. Retailers are reported to be increasing their demand for this wood. Retailers and car-building plants are also coming to the front with their wants. Prices, however, are still unsatisfactory on many items. On the whole the yellow pine market is more promising than it has been for some months. Red cedar shingles at Chicago are quiet, with very little demand for immediate delivery. The sales in progress are at a price a little below what the mills are asking. White cedar shingles are steady with no indication of an advance. Higher grades of lath are also steady and there is still a scarcity of white pine, Norway and hemlock lath. The cooperage situation shows no improvement. All kinds of staves and heading are cheap and the prospects are not encouraging.

The outlook for northern pine at New York is rather better and wholesalers are expecting considerable improvement in trade. Yard assortments are unusually low. Prices are well maintained. The yellow pine trade is dull but the offerings are not very numerous. There are indications, however, that trade is improving slightly. The large local stocks have been fairly well reduced and few of the yards have any more than they actually need. Prices continue unchanged.

At Buffalo, both enquiries and actual trade in northern pine are small. Prices, however, continue steady on the better grades. There is a good outlook for local business. Low grade pine shows practically no improvement. Hemlock is quiet, as the demand for building matreial has fallen off with the winter weather. Prices are not very strong, but stocks in the hands of buyers are light and improvement is looked for. The demand for shingles at Buffalo is light with prices unchanged. There is a good prospect for a fair amount of business in the near future as dealers' stocks are somewhat light. Sales are largely confined to red cedars but there is some business in redwoods and white cedars, the latter coming from Canada.

A stronger situation is reported in hardwoods at Chicago. This applies to practically all stocks. Buyers who have recently been in the south report that there is scarcely enough stock available to make it worth while travelling. Dry oak is in strong demand and scarce, and prices of 1sts and 2nds, plain sawed red oak, will probably advance. In the northern woods there is a fair trade. Maple and birch are the strongest and the upper grades of basswood have shown some improvement. The demand for hardwoods at New York is dull but prices are unchanged, as a result of the scarcity of high grade stocks. Beech, birch, maple, chestnut, ash and good grades of oak are difficult to secure. Lower grades are plentiful. At Buffalo there is a good demand for plain oak and prices are strong. Quartered oak is holding its own. Birch, maple and chestnut are strong with a tendency to advance.

Mason, Gordon & Company, wholesale dealers in lumber and timber, Montreal have remembered their friends in practical fashion at the beginning of the year by sending out a useful steel paper knife.

Market Correspondence

Ottawa Trade Much Improved

Ottawa, January 11.—There is a much better feeling about the cheaper lumber just now and a greater demand for it. J. R. Booth Company sold their entire stock of mill culls of last year's cut, ranging between 5,000,000 and 6,000,000 feet, the greater part of which is to be exported to the United States. The removing of this large stock off the market, as far as the manufacturers are concerned, is good news, as there is considerable of this quality of lumber in stock. Other firms are reported to have also disposed of their mill culls. The price paid for J. R. Booth's stock was a very slight decrease from what the similar stock was sold for a year ago, but a good price as compared with the sales during the summer. It will all be shipped out before summer.

The Old Country market seems to be pretty good. Number one deals, it is reported, have sold as high as 15 per cent. above last year's contracts. However, the average is about 10 per cent. advance for the first three classes and no change at all in No. 4.

The market is also better for red pine of all classes. One firm reported that while red pine was very slow during the summer it has been steadily getting better this fall. For some 3-inch, for which only $18.50 was offered last summer, the firm has an offer now at $22.50 per M. The advance, however, is not quite $4, because the specifications in the two offers were somewhat different and it really indicates an advance of about $3 per M. There is also a good demand for 2-inch No. 2, and, in fact, for nearly all thicknesses. Better prices are being offered for birch.

The conditions in the camps are very favorable and highly satisfactory to all the manufacturers. J. R. Booth ha sabout 400 teams upriver now. The cold weather put the roads in excellent condition.

Gilmour and Hughson are making some changes in their sawmill at Hull. The are substituting band saws for circular saws in some cases.

Booth's pulp mill was closed down for about 24 hours owing to inability to get the pulpwood. The railway commission ordered the Grand Trunk to remove its line running into the mill, which crossed Wellington street on the level, and, instead, to cross under the viaduct. The railway company and the C.P.R. could not come to an agreement as to the conditions under which the G.T.R. should go under the viaduct on of employment in Ottawa and Madawaska as a result until a temporary arrangement was reached between the two companies pending a final settlement.

Two new planing mills will be ready for operation next summer in the city. Cummings Company, of Kazaubazua, will erect a mill in the outskirts at Westboro. The siding has been constructed and the mill, it is expected, will be built very soon. J. E. Wilson has also begun the construction of his planing mill in Ottawa South.

Most of the local planing mills took advantage of the quietness at Christmas time to make necessary repairs. Jas. Davidson's mill was shut down for two weeks while repairs were going on. In most cases these repairs were chiefly strengthening parts of the factory and some enlargings.

A Flurry in Pulp Circles

Montreal, January 9th.—Considerable speculation and curiosity has been in the air as to the meaning of a sudden jump in the price of shares of the Laurentide Pulp & Paper Company, which in twelve hours went from 185 to 195, and were expected to go to 200. The Montreal "Star" said that "interests" were endeavoring to control the famous paper company, hinting that the interests were Messrs. Greenshields, Greenshields and Lanqueduct. Mr. Greenshields, according to this report, had been offering 200 for blocks of Laurentide and was anxious to get control, owing to the success he had had in launching the Wayakamite Company. Leading brokers, however, when interviewed said that a controlling interest in Laurentide could not be obtained for 250; "nor even for 300," said one of them.

As a matter of fact, what actually set the street guessing, was the activity of Wayakamite Company in other directions. The company had just been floated for $5,000,000 fully paid up, the chief interests being Mr. Charles Greenshields, of Montreal, and Mr. C. R. Whitehead, of Three Rivers; Mr. Whitehead being the big cotton mill proprietor in the eastern city. Six per cent. bonds to the value of $3,000,000, redeemable in forty years, were quickly disposed of and the company negotiated for and purchased the extensive timber limits, and saw and pulp mills of the Baptist family at Quebec, Mr. Alexander Baptist being the active representative.

For some time these limits have not been worked to their full advantage and the new company is determined to remedy this state of affairs. Mr. T. Pringle, of the Coristine Building, Montreal, has received instructions to prepare plans for a 100-ton pulp mill, and other large improvements and developments are to be started directly the snow lifts.

The Canada Lumberman is assured on the best authority that the Wayakamite Company are not after the Laurentide.

Dull Market at Montreal

Montreal, January 11.—The quietness incidental to stocktaking and the closed port continues, and although lumbermen claim to be optimistic as to the coming season, they are still waiting to see which way the cat will jump. "December," said a prominent man, "was the slowest I remember in many years, and January has not shown signs of any improvement. Everything is quiet everywhere." Another lumberman claimed that "things were beginning to move, but was unable to designate the "things." Along the harbor front only one office was open yesterday morning and that was occupied by one representative of a firm which generally has many clerks busy. "Trade?" said he, in response to a question. "Spell it. I've forgotten how."

Good news filters through from the lumber camps where it is reported that heavy falls of snow are helping matters along and work is proceeding briskly.

Birch is reported steady at $55 to $60, spruce scantlings $18 to $20, whilst there is a good market for lathe at from $2.50 to $4.

An Opening for Lumbering Supplies

The Canadian Trade and Commerce Department reports, referring to British Guiana, say:—

With the advance in lumbering has come a larger demand for axes and saw mill necessaries. Supplies have been purchased from the United States and Great Britain; Canadian goods, in these lines, are unknown and inquiries concerning them reaching this office, evidence a desire to give them a trial. Canadian manufacturers should at once place samples in Georgetown as the trade is growing and will still further expand. Lumber operations will require a large number of axes and other tools suited to the industry. The cutlass used in British Guiana in clearing land comes from Great Britain chiefly. The axes and other cutting tools are represented as being of the highest quality of steel, though sold at a low price. Canadian firms intending to show samples would do well to remember this.

The importation of staves, shooks, etc., which are required for the sugar industry, runs up each year into large figures. Hoops come from the United Kingdom, the staves and shooks from the United States. Reference has been made in other reports to the fact that some effort might be made by Canadian firms to obtain part of this import. As Canada has native woods of strength and durability equal to oak, it would seem that experiments ought to be undertaken with a view to making a cask of such woods, to replace the oak ones now supplied by the United States. The importation of staves, shooks and hoops is given in the following statement for 1909 and 1910:—

	1909 Packages	1910 Packages
Wooden hoops	1,860	23,580
Shooks	6,171	859
Staves, oak	945,305	592,153
Staves, other	92,420	7,200

Though a considerable cut of native wood is on the market for local purposes, the amount of foreign lumber is on the increase. The largest part comes from the United States and only in spruce lumber does Canada appear in the statistics. The table given for 1909 includes all undressed lumber "other than pitch pine."

	Feet.
Canada	894,502
United States	1,052,179
British West Indies	18,500
Others	5,278
Total	1,970,459

For 1910 the corresponding total was 2,680,830 feet.

A recent report issued by the Institute of Mines and Forests mentions that capital is being invested in timber limits in the colony by firms in the United States and on that country they must depend for the future export of their lumber. However that may be, at present most of the lumber goes to the West India Islands and Great Britain; Canada takes to the value of $16,642, chiefly in crabwood and greenheart. Considering the large forest area and the value of the timber contained in the forests, the cut is remarkably small. Last year the total value of the lumber got out for export was only about $120,000. An earnest effort, however, is being made to accomplish something in putting more of this wood on the market and one leading firm is advertising and pushing greenheart and crabwood. The lumber camps of this firm are now assuming some importance in the colony. The Demerara variety of greenheart is of the highest quality. Crabwood, a sort of mahogany, is being exported for the manufacture of furniture and other ornamental work. Of a reddish color, softer than mahogany and not so brittle, with a straight grain not unlike cedar, it is capable of being easily worked and taking a fair finish.

Canadian Wood Goods in England

Building Trade, Mines and Railways Responsible for Large Consumption—Present Prices and Trade Conditions

Liverpool, December 27.—The great field for the employment of yellow pine, and spruce, in the United Kingdom, is that of the building trade. In residential houses, window frames, sashes, shutters, stairs, doors, cupboards and shelves, are, almost without exception, made of yellow pine. Floors are of white pine, and very much of the wood used for this purpose comes in dressed and tongued-and-grooved. In late sales, 1 in. x 7 in.; ⅞ in. x 6, and for more special uses 1¼ in. x 6, are sizes which have sold readily. Purlius and rafters, used in general house-building, are usually of white pine, and for these, any quality of timber which is fairly sound, is suitable. Purlius ought to be sound as they have to carry much weight, but apart from this, almost any quality of wood will serve for them. Through the year, building has been moderately active, but since the middle of November it has been quietening down. English builders like to bring building work to an end, as far as possible, before the dark mornings and nights, and the rain and frost of the winter come on. At present building operations are quiet, so that the consumption of yellow and white pine in arch work is not now on a large scale. Trade generally is good and improving, and everything points to its being active in the coming spring. The building trade is almost certain to be busy then, so that a good demand for building timber in the coming spring seems assured.

Quebec Spruce.—In the market the outlook for Quebec spruce is good, and prices have an upward tendency. Third Quebec, 13 feet of 3 3 in. x 9 in. has lately sold at £$10 to $£9 15s. 0d. per standard. St. John's cut, 3 x 11, has sold at £10; 3 x 9 at £9 10s. 0d. and £9 5s. 0d.; 3 x 8 at £8 5s. 0d. to £8 0s. 0d.; 3 x 7 at £7 15s. 0d. and 3 x 6 at £8 0s. 0d. and £7 15s. 0d. Montreal pine, 12 feet and up, of 3 x 11, has averaged £27 15s. 0d.; 2nds, £20 15s. 0d. and 3rds, £15. Montreal, dry 3rds, 3 x 7, have brought £9 0s. 0d. to £9 10s. 0d. per standard.

Mining Timber.—The coal mining industry of the United Kingdom maintains a large consumption of timber suitable for pit uses. The kind chiefly used is known as pit-wood or pit "props," and consists of round fir-wood 3 inches or 4 inches in diameter. Wood of the kind of practically any length can be worked up, as it is used as props for the main roads, drifts and headings in the coal mines. Large quantities of props of the kind are in continuous use, and the arrivals of pit-wood are on a large scale, and are received at ports near the great coalfields. Cardiff, Swansea, Nelcastle, Hull, Whitehaven, North Shields and Liverpool are the principal ports of entry for pit props, as being the ports for one or another of the larger coalfields. The wood arrives in all sorts of quantities, odd lots, small lots or almost cargoes, and can, practically all be used up for work in or about the mines. The prices of pit-wood are consequently more or less nominal. Three-inch props, in short lengths, bring 2d. or 3d. per yard, while the longer lengths—poles, as they are termed—are sold by the running foot; or at so much per 72 running feet. Three-inch poles have recently sold at 3s. 6d to 4s. 3d. per 72 running feet, and four-inch at 4s. 6d. to 6s. 6d. per 72 running feet. Heavier timber for mine uses, above ground, is in steady and fair consumption, for general construction work, mainly for the building, extending or repairing of sheds, stages, "staithes" or other structures of a strong and rough class, which are largely required at collieries or points of shipment. Mining timber of this heavier class is quoted at 10d. to 1s. 1d. per cubic foot. For head stocks and main timbers of sheds and other buildings on structures at collieries which have to carry weight, strong pitch-pine log timber, cut to sizes wanted for the work on hand is used. A good deal of timber of this kind is used up in the course of a year.

Hewn Pine.—The consumption of hewn pitch pine of first-class quality has improved of late and Canadian square pine has also been in more request, though the consumption of both kinds, through the year, has been on a smaller scale than in 1909 or 1908. Quebec square white pine is quoted at 1s. 9d. to 3s. 6d. per cubic foot; Quebec red pine at 2s. to 2s. 5d., and St. John's, averaging 18 inches, at 2s. 4d. to 3s. 3d. per cubic faat. United States hewn pitch pine sells at 1s. 9d. to 2s. 3d. per cubic foot; sawn at 1s. 4d. to 1s. 7d., and stowage planks at 1s. to 1s. 2d. per cubic foot.

Railway Wood.—The railways of the United Kingdom form one of the more extensive and valuable fields of consumption of timber in the country and maintain a large and continuous demand for soft woods and hard woods. The railways' use divides itself into three classes. One of the larger uses is common fir; to provide the sleepers required for the permanent way of the different "roads." The demand for suitable wood for sleepers, is large and continuous, as the re-laying of roads is going on continuously. The sizes of the sleepers in use are 9 ft. x 10 in. x 10 in.; 9 ft. x 10 in. x 5 in., and 9 ft. 9 in. x 4½ in. The prices vary from time to time, according to the size, and may be taken as ranging from 7s. for the larger sleepers down to 2s. or 2s. 2d. for the smaller ones. The wagon building and repairing branch represents a second class of consumption, and one which also maintains a large and steady demand for the different kinds of timber used for the purpose. Aak for frames and bottoms, in planks or square, with side wood, as may be, is required, and for this there has been a good inquiry. The large number of different types of trucks, wagons and vans used in the heavy traffic branch, causes the demand for side, end and roof timbers of the conveyances to vary a good deal according to the class of goods for which a wagon or van may have to be used. For the underframes, however, oak is used, and as building or repairing is continually in progress, a steady demand for the different kinds of timber used for the purpose. Oak for sents a third class of consumption, as hardwood is used almost exclusively for this. Oak for the framework and teak and mahogany for filling-in and paneling and for decorative uses, are the timbers required, and for these, as in the wagon branch, there is a good and steady demand. Quebec oak, of first quality, holds a high place in the English market, and brings the top price, being 2s. 10d. to 4s. per cubic foot. Second quality, Quebec, brings 1s. 9d. to 2s. 10d. United States oak planks are 1s. 9d. to 2s. 4d. per cubic foot, and oak timber generally 1s. 6d. to 2s. 4d.

Good Demand in England for Pine Doors

The Department of Trade and Commerce, in their weekly reports, publish the following report from their Manchester office, upon the market for pine doors:

"The British Board of Trade returns do not classify pine doors, but they are included in house frames, fittings and joiner work, and herewith is given the value of these imports:—

Month ending November 30, 1910.

1908	£15,224
1909	16,529
1910	18,758

Eleven months ending November 30, 1910.

1908	£194,358
1909	170,542
1910	186,525

"The following sizes furnished by a large importer of doors are said to be best suited for this market:—

6 ft. 4 in. x 2 ft. 4 in. x 1¼ in.,	square, 2 sides,	four panels.
6 ft. 6 in. x 2 ft. 6 in. x 1¼ in.,	"	"
6 ft. 4 in. x 2 ft. 4 in. x 1½ in.,	"	"
6 ft. 6 in. x 2 ft. 6 in. x 1½ in.,	"	"
6 ft. 8 in. x 2 ft. 8 in. x 1½ in.,	"	"
6 ft. 4 in. x 2 ft. 4 in. x 1¼ in.,	moulded 2 sides,	four panels.
6 ft. 6 in. x 2 ft. 6 in. x 1¼ in.,	"	"
6 ft. 4 in. x 2 ft. 4 in. x 1½ in.,	"	"
6 ft. 6 in. x 2 ft. 6 in. x 1½ in.,	"	"
6 ft. 8 in. x 2 ft. 8 in. x 1½ in.,	"	"
6 ft. 4 in. x 2 ft. 4 in. x 1¼ in.,	moulded 1 side,	four panels.
6 ft. 6 in. x 2 ft. 6 in. x 1¼ in.,	"	"

"The above doors are asked for in third and fourth quality to meet the requirements of the largest customers consisting of building contractors who, obtaining a piece of land on cheap rent proceed to erect 100 or 200 brick tenements chiefly for speculative purposes and renting from 7/6 to 8/6 per week. Nothing can be too cheap in all the fittings of these houses, hence the importer merchant hands are tied as to price. Sweden, Canada and the United States contribute chiefly to the supply, and with such extensive market Canada might be expected to export more than $24,116 of doors, sashes and blinds, the amount stated in Trade and Navigation returns for Canada for the year ending March 31, 1910.

"The importer jealously guards the price he is willing to pay for suitable doors, and no persuasion can extract it from him, hence that feature is perforce eliminated in correspondence with Canadian manufacturers. The doors should be shipped loose and prices quoted f.o.b. Liverpool or Manchester."

Good Opportunities in South Africa Trade

There is much room for improvement in Canada's timber trade with South Africa, says a special report of the Canadian Trade and Commerce Department, and no reason why the Dominion should not have almost the whole of that portion of the business which goes to the United States, except in so far as it is confined to Georgia pitch pine. With the improvement which has commenced in the building trade, the South African imports of timber should show substantial increases during the next three or four years, as compared with last year.

To be successful in this trade, and this applies to all kinds of timber, it is necessary to send out the material absolutely up to specifications. The greatest care should be taken to ensure that the whole of the order is cut to the proper lengths. In fact great attention to detail is teh prime factor in securing a reputation for exporters.

It is a matter of complaint that some mills send out coarse grained stuff, or a part of the order will be coarse grained and part of it fine. However, it is gratifying to know that some mills, and one in particular, have already built up an excellent reputation.

It will be seen that the greater part of the trade goes to the

Baltic, the deals from there being said to be the best. It is stated that Canadian and United States deals do not stand this climate as well as the Baltic; if stacked for very long they are apt to split and warp. It is also said that Canadian exporters cannot supply the same variety of lengths, nearly all of theirs being 16 feet whereas the requirements are from 10 feet to 30 feet length.

Owing to the shortage of other kinds of timber, the imports of spruce are likely to increase, which will be of a decided advantage to Canadian lumbermen.

Timber imports for four years were as follows:—

	1909 £	1908 £	1907 £	1906 £
Teak—				
India	10,028	3,077	9,026	11,362
Total	10,398	3,732	10,467	12,430
Other—				
Canada	21,778	16,299	21,460	20,494
Australia	14,695	11,727	15,494	18,332
Norway	28,809	19,459	25,637	24,214
Sweden	180,194	152,105	117,883	164,504
United States of America	120,230	90,474	104,575	89,006
Total	375,788	300,095	292,144	332,376

The Canadian share of the trade in other than planed and grooved is probably confined almost entirely to what is classed as shelving. While some excellent material has come out to this market from the Dominion, there has also been much that is of very poor quality. Any mill which would guarantee to ship goods entirely up to specification, could be sure of building up a steady and lucrative trade.

Imports for four years were as follows:—

	1909 £	1908 £	1907 £	1906 £
Canada	6,442	4,940	9,000	7,903
Sweden	1,490	2,171	62,917	108,137
United States of America	8,950	12,220	17,240	27,585
Total	18,038	20,546	117,720	165,855

Canada does not seem to be able to do anything in flooring and ceiling, practically the whole of the material coming from the Baltic. It is possible that later on, a little business may be done in maple flooring in some of the better class buildings, but this would have to be worked up through a commission merchant rather than through an importer of timber, as it probably would be too small a line to be taken up by the latter.

Imports for four years were as follows:—

	1909 £	1908 £	1907 £	1906 £
Norway	15,445	14,830	......	......
Sweden	74,118	64,832	......	......
United States of America	2,819	5,244	......	......
Total	95,078	85,453	(Included in planed and grooved.	

The trade in boxes is almost certain to be an increasing one, as there is very little material in this country suitable for this article. The reason for the increase is due to the number of new industries established and growing, which required boxes for the shipment of their goods, notably those devoted to fruit, jam, dynamite, candles and soap. The demand for butter boxes is also expanding. Up to the present it has been almost impossible to get quotations for boxes of any kind from Canada. As spruce is so eminently suited for butter boxes, it seems unfortunate that none of the mills seem inclined to cater for this class of trade. It would be necessary to secure this business to land a box here under the Australians, whose c.i.f. price is about 1s. 9d. a piece.

Many trade inquiries for boxes of all kinds have been sent in to the Weekly Report. In most cases specifications as to size have accompanied them. The greater number of these were published about the middle of last year.

Imports for four years were as follows:—

	1909 £	1908 £	1907 £	1906 £
United Kingdom	6,013	6,567	7,185	9,879
Australia	1,371	623	42	172
Sweden	33,481	34,655	28,190	36,324
United States of America	472	418	650	995
Total	45,947	46,385	40,157	56,238

The demand for pulpwood cut from private lands has become so great in Eastern Canada (on account of the Quebec law prohibiting the export of wood cut from Crown lands) that quite an extensive development of the pulpwood business is taking place in the Island of Anticosti. It is believed that a permanent production of 300,000 cords per annum can be maintained by the Island. This winter there are from 500 to 600 laborers employed in cutting wood. Mr. Menier, who expects to visit Anticosti next summer, is spending half a million dollars at present in building mills and a railway. There are already ten miles built of the latter, leading from the scene of operations in the woods to the new mills at Ellis Bay, which will have a capacity for sawing and peeling 400 cords of pulpwood per day. Twenty miles will be added to the railway next year, and probably as much more each year until it runs the whole length of the island.

A Successful Man's Suggestions

C. A. Smith, the well-known Minneapolis lumberman, who is also the operator of one of the largest plants on the Pacific coast, which is located at Marshfield, Oregon, has been making some valuable comments on lumber conditions prevailing on the coast. From these suggestions the following pertinent thoughts are selected:

"Present prices paid for lumber do not warrant the awful expenditure of human physical effort, the operation of costly machinery, the large outlay of money, the exercise of the best mental skill and the denuding of the forests of this coast necessary to bring the logs to the mills. The manufacture of lumber in the mills is mere play to the much more strenuous work in the woods. I contend that it is almost sinful that a product should be sold at such poor prices as lumber is sold to-day, when the securing of raw material from which it is made requires such enormous sacrifice, not in money alone, but of human muscle, brains, and even life, as well as the sacrifice of the greatest resource of the coast—our forests. It is difficult to impress the importance of these facts upon the mind of a man who is unacquainted with the facts in logging. Loggers of the East know little of the hard work required on the coast if they have not seen it for themselves. With a view of impressing upon their minds in the most forcible manner the hardships of the logging end of the business, I intend within the next sixty days to have our salesmen in the different parts of the country visit Coos county and see for themselves the processes necessary to make possible the manufacture of the product which they are selling. I believe that the salesmen, when thus enlightened, will hold lumber more dearly and will not sell it for less than it is worth merely to meet a bearish market. Seven separate powers are necessary to get the logs from the woods to the mill, but still greater sacrifice is the other power used in these operations—the power of human strength represented in the men employed on the logging crew. At times the work becomes more severe than the moment before, and then these remarkable specimens of human endurance must strain the utmost muscular strength and apply all the force in their power, however exhausting it may be. The unfortunate will happen and some fearless logger will be frightfully injured or pay the toll of his life for the sake of commerce and the lumber industry.

"Of course, the loggers are paid well for their work. Fifteen years ago the average wage in the woods was $15 and board. Eight years ago, $30 and board; and now the wages paid in the camps of the coast, at least in Oregon, average for all classes, $60 a month and board.

"I truly believe that if the proprietors and salesmen could realize and see the conditions and operations of the coast logging camps, they would know the cost, human and financial, and would hold lumber at a higher rate, which the product deserves should be paid by the consuming world.

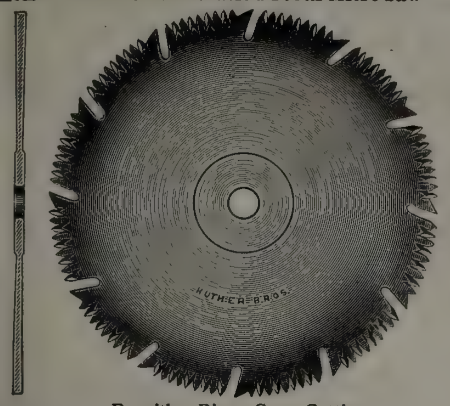
"I wish to urge upon the operators of the coast to give this matter their consideration and to endeavor to impress upon their salesmen the expense and labor necessary to create the lumber. In making this appeal to the operators, I am convinced that a trial of this system would result in a better price being secured by those who handle the sales of the lumber."

Forestry Convention Arrangements

The Dominion Forestry Convention in the city of Quebec January 18-20 will be one of the largest gatherings of the kind in Canada since the Ottawa convention of 1906. Mr. Lawler, secretary of the Canadian Forestry Association, was recently in Quebec attending a meeting of the local committee, of which Mr. H. M. Price, the well-known limit holder, is chairman. Through the kindness of the Premier of Quebec and Hon. A. Tourgeon, president of the Council, the Legislative Council Chamber, in the Parliament Buildings, will be used for the convention. It is expected that Sir Wilfred Laurier, who called the convention, will preside on the opening day, and at as many other sessions as his engagements permit. In the event of his absence from any session the chair will be occupied by Senator Edwards, president of the Canadian Forestry Association. His Excellency the Governor-General will open the convention, and among those who will attend the opening are: Mgr. Roy, auxiliary bishop, representing His Grace Archbishop Begin, Right Rev. Hunter Dunn, Anglican bishop of Quebec, the Mayor and the representatives of churches, universities, public bodies, etc. It is reported also that practically every large lumbering firm in Quebec will be represented. The Government of Quebec will entertain the leading delegates at a banquet and another social function will be held for the ladies in the form of an excursion to Montmorency Falls on Friday afternoon. The programme includes many practical papers.

HUTHER BROS.

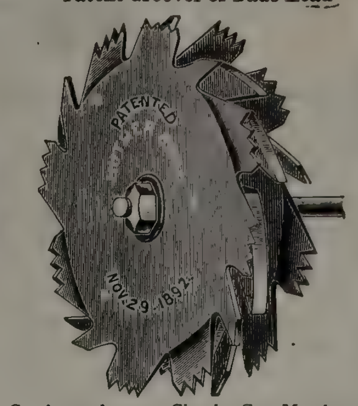
Hollow Ground Combination Tooth Mitre Saw



For either Rip or Cross Cutting

Will cut equally as smooth in either Ripping Cross-cutting or cutting at an angle of 45 degrees, with grain of wood.

Patent Groover or Dado Head



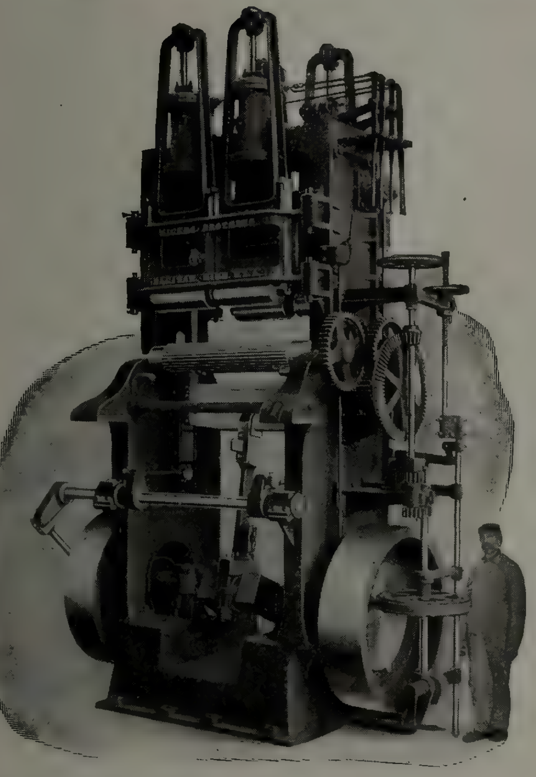
Can be used on any Circular Saw Mandrel

For cutting any width groove from 1/8″ to 2″ wide. Will cut either with or across the grain (Sent on approval).

Allow us to quote Prices on Saws for any special work that you wish to do.

HUTHER BROS. SAW MFG. CO., Inc., - ROCHESTER, N. Y.

Wickes Gangs



cut the thinnest board which will dress to Standard, using 18 to 14 gauge saws and removing 3/32″ to 9/64″ kerf, depending upon class of timber and amount of output desired.

With the installation of a **Wickes Gang,** the output of a mill can be largely increased with very little additional cost of labor and the product will be of perfect manufacture insuring higher prices.

EDGINGS

Ontario

J. Findlay & Son, Norwood, Ont., have recently taken up the manufacture of hardwood flooring, handles, etc.

Between August 1 and December 10, at No. 6, McCoshen's, camp on the Rouge river Limit of the E. B. Eddy Company, Limited, 105,000 pieces were cut and piled ready for hauling. In addition to this, the camp was also built during the same period. The men were still going ahead when last heard from, and were confidently expecting to break all records.

The Fesserton Timber Company, Limited, who recently took over the lumber business of W. W. Carter at Fesserton, Ont., have erected a modern double-cut band mill and will continue to manufacture lumber and cooperage stock. They have now a considerable stock of lumber and cooperage on hand and are taking out a good stock. They therefore expect a good season this year.

The Chatsworth sash and door factory has been contemplating moving into Owen Sound, Ont., for some time, and a recent change in the management has resulted in a definite move being made. The mill has been operated by Manager Galbraith and Dr. J. Airth. The latter's interest has been purchased by Mr. Walter Bumstead, of Owen Sound, and Mr. Wm. Arthur, of Woodford, who are now preparing to move the mill. They will commence the erection of a modern mill building immediately. The site has not been selected yet. The firm employ about 25 hands and manufacture all kinds of interior woodwork.

A tie-up of the J. R. Booth lumber business at Ottawa for two days resulted from a delay on the part of the C.P.R. in allowing the G.T.R. to use a quarter of a mile of track at the Chaudiere terminal. The Railway Commission ordered the G.T.R. off a viaduct, and to get in on the level the C.P.R. line was necessary. A temporary agreement, however, was made and work was started and continued till the last of the waiting cars had been sent on its way. Specially augmented crews worked all night to do this, the railway sparing no effort to relieve the congestion. One hundred and seventy-five flat lumber cars had lain idle and forty of the Booth's teams stood in the stable while the dispute lasted.

The McDonald-Rowland Lumber Company, who have been in business at Owen Sound, Ont., for a number of years, are changing into a joint stock company and have made application for charter. The new company will be known as the Great Lakes Lumber Company, Limited, having an authorized capital stock of $40,000, divided into shares of the par value of $100 each. The company own and operate two stationery sawmills situated in good timber regions. As they have a large stock of logs to take out this winter, in order to provide additional funds for the operation they are offering for investment an opportunity to purchase shares. The directors will include the Hon. A. G. Mackay, Mr. W. H. Merritt, of the National Table Company, and Mr. W. A. Rowland, manager of the McDonald-Rowland Lumber Company.

Eastern Canada

Narcisse Desjardins, lumber merchant, Montreal, is reported to have assigned.

J. P. Dupuis, lumber merchant, Verdun, Que., has registered under the names of Dupuis & Monty.

A winding-up order has been made for the Talbot-Allard Lumber Company, Limited, of Montreal.

Napoleon Leblanc, lumber merchant, St. Pierre de Wakefield, Que., is stated to have sold his assets.

Messrs. Reed, McRae, McNerny & Robinson will erect and operate a sash and door mill at North Hatley, Que. Cost, about $25,000.

W. B. Snowball, of Chatham, N.B., and A. H. Hanington, have been appointed permanent liquidators to wind up the Miramichi Pulp & Paper Company.

The Montreal Paper Company, Limited, Portneuf, have been incorporated with capital of $100,000. The incorporators are: Thomas P. Bishop and G. W. Bishop, both of Notre Dame de Portneuf.

Negotiations are under way for the purchase of the mills and timber limits of the Scott Lumber Company at Magaguadavic, N.B., by an American syndicate. The price, which is under consideration, is said to be in the neighborhood of $150,000.

The contractors on the National Transcontinental Railway in Quebec, north of the St. Lawrence, have opened up large new areas of pulpwood country, and it is reported from Price Bros., are already actively engaged securing sites for the erection of mills in this district.

Thomas Robinson, M.P.P., has purchased a large tract of land at Acton, N.B., and has a large number of men employed thereon getting out pulp wood to be shipped from Harvey's Station. It is said that some 2,000 cords will be taken off this tract in a short while.

The customs revenue of Newfoundland for the season of 1910 showed an increase over 1909 of $90,000 in spite of the fact that a very poor fishing season was experienced. The increase is due to the development of the pulpwood, railway and mining interests of the colony.

A timber property containing 175 acres in the parish of Wexford, Kings County, N.B., formerly held by George McKean, lumber merchant, of St. John, has been sold at auction, the new purchaser being Mr. Golding, of Hampton. Two other lots of 200 acres and 100 acres were also sold at the same time.

At Bathurst, N.B., the work of dredging the harbor is suspended, but will be vigorously prosecuted next year. The work already accomplished has had the effect of drawing the attention of capitalists to the resources of the locality. A corps of engineers was recently at work locating sites for the construction of a large pulp and paper concern, financed by American capital, which, it is announced, will be commenced next year and completed as rapidly as possible.

The Crowe Lumber Company, Limited, of Brooklyn, Hants County, N.S., have now a fine new double cut band saw mill which will cut during the summer of 1911 some 6,000,000 feet. This company have 18,000 acres of timber lands of splendid quality, well wooded and of easy approach. The streams are good for driving without much expense and the company have an enormous quantity of water impounded 25 miles from the mill, with a head of some 13 feet. There is unlimited power to drive the mill. The owners are Messrs. C. E. Crowe and Ira Crowe, of Colchester.

Considerable alterations and extensions to the large saw mill of the J. B. Snowball Company, Chatham, N.B., are in course of being carried out, the effect of which will be to add very considerably to its capacity. The present buildings have been added to by the erection of an extension 32 feet in length, and another piece has been built on the south side of the skylight to make a filing room. At present there are three gang saws in the mill. Two of these will shortly be taken out, and in their place, an eight-inch band mill, a seven-inch resaw band and a twin rotary slabber will be installed, leaving only one live gang saw for future use. The trimming and survey tables will stand in the new part of the buildings, and the rearrangement of the plant will materially facilitate the carrying out of the operations of them all. The alterations will be finished in time for the opening of the next season's operations.

Western Canada

The B. C. Gazette gives notice of the incorporation of the Koksilah Lumber Company, Limited, with a capital stock of $35,000.

In the fire which recently destroyed the business portion of the town of Bradwardine, Man., one of the heaviest losers was the Beaver Lumber Company, which lost its office and a quantity of lumber.

Mr. Jenkins, as president of the H. L. Jenkins Lumber Company of Seattle, has just organized a new company, to be called the North America Lumber Company, Limited, and will have a capitalization of $3,000,000.

The Western Manufacturing Company, of Regina, have purchased the Saskatchewan Sash & Door Company, of Moose Jaw, and intend to erect a modern plant. They state that they will employ 50 hands the year round.

The town of Penticton, B.C., has passed a by-law ratifying the agreement with the Penticton Lumber Syndicate, under which the syndicate will establish a saw milling business. The mill is to have a capacity of 30,000 feet per day, and a plant will also be installed for making wooden pipes, fruit boxes, sash and door, and other builders' materials.

Only one bid, from R. McNair, of Vancouver, was received at the auction of a timber berth at the Crown timber office, New Westminster, recently. The upset price was $2,570 and the price paid was $2,750. The limit, which consists of 640 acres, comprising section 28 of township 29, was put up for auction at the request of Ross Speers, of Vancouver.

The Canyon City Lumber Company, of Canyon City, B.C., have developed a plan for converting their cut over lands into fruit farms. They have limits covering 12,500 acres and expect to log from 300 to 400 acres a year. The land will be immediately cleared and planted. The company will not place the land on the market until the trees are bearing fruit.

The British Columbia Log Brokerage Company, at its annual meeting, quoted the following prices for logs: No. 1, $12 per thousand; No. 2, $9 per thousand; No. 3, $6.50 per thousand feet. The following directors were elected to serve for the current year: President, Mr. John O'Brien; vice-president, Capt. Theodore Magneson; secretary-treasurer, Mr. Fred H. Parks; directors, Messrs, H. D. Blackford, John A. Smith, T. E. Hiland, J. S. Pallen, D. J. O'Brien and J. M. Dempsey.

The interests of the Vancouver Timber & Trading Company have been purchased from Mr. H. L. Jenkins, of Vancouver, by Alvo von Alvensleben, Ltd., of Vancouver, the price reported being $1,000,000. The business of the concern includes six large logging camps, over 20,000 acres of timber land and some 20,000,000 feet of logs in Burrard Inlet. Mr. Joseph Beech, secretary of the Vancouver Timber & Trading Company, will continue in office under the new control.

The Pigeon Lake Lumber Company, of Millet, Alta., is taking over the interests of the O'Brien Lumber Company at Strathcona, Alta. Mr. P. J. Mullen, of Millet, is the controlling stockholder and manager of the Pigeon Lake Company. The warehouses and workshop of the company at Strathcona will be enlarged. Mr. S. Q. O'Brien, the retiring manager, will still retain an interest in the business. The sawmills of the company are located at Pigeon Lake in the midst of valuable timber limits and their output is in the neighborhood of three million feet per annum.

Galbraith & Sons intend erecting a large sawmill and factory on Lulu Island, B.C., within the New Westminster city limits, and have asked the city council for a twenty-five year lease of the water lots where it is proposed to build with the option of an additional twenty-five years' lease at the expiration of the time. The sawmill of the proposed new plant is to be 40 by 225 by 60 feet. The plant is to be a most up-to-date one in every respect and will have a large dry lumber shed 45 by 65 feet, dry house 30 by 120 feet, and a loading plant 30 by 40 feet. The mill will be a three-storey one. This is only one of several industries that are planning to build on Lulu Island.

Trade Enquiries

The Dominion Government Trade and Commerce reports contain the following trade enquiries. Readers of the "Canada Lumberman" may obtain the names of enquirers by writing us, enclosing stamped envelope, and stating number of enquiry.

1941. Agency abroad.—A Yorkshire correspondnet stated to have a market for Canadian hardwood paving blocks, would like to secure the agency of manufacturers in the Dominion.

1947. Agency abroad.—A north of England correspondent is open to act as agent on commission for the sale of Canadian deal lumber properties.

1950. Maple blocks.—A London firm makes enquiry for the names of Ontario manufacturers able to supply maple blocks suitable for mangle rollers, sizes 18 inches to 26 inches by 7 inches, octagan shape, or rough-turned and bored.

11. Lumber.—A American broker in Havana, representing shippers of southern pine, wishes to sell Canadian white pine and spruce and box-shooks in the Cuban market.

THE

Standard Automatic Brush

does your painting work in a new way, better, quicker, cheaper, eliminating all waste of paint. An equal flow at all times; thickness of coat can be accurately adjusted. Absolutely clean and fireproof.

THE STANDARD AUTOMATIC SYSTEM

does away with the paint can. It eliminates the dip and is far superior to the spray, but it does rub it in. No air pressure is needed. Will work with any kind of paint. Get next to this new method. Made especially for manufacturers of automobiles, automobile bodies and wheels, all kinds of vehicles, carriages, etc. It is most useful for manufacturers of furniture. It will also save a lot of time in painting structural work, such as bridges, elevated roads, etc. House and sign painting can be done effectively and quick.

Wherever duplication of work exists, this device will increase your output and reduce the cost. Buy just one outfit to-day and be convinced. We are sure that we will have to epuip your entire plant. Special equipments can be made to suit your purpose.

Complete outfit consisting of a large paint tank, either stationary or movable, with automatic valve and six feet of flexible tubing together with the automatic adjustable brush made of aluminum, costs $7.50, and it is still cheaper than the ordinary brush.

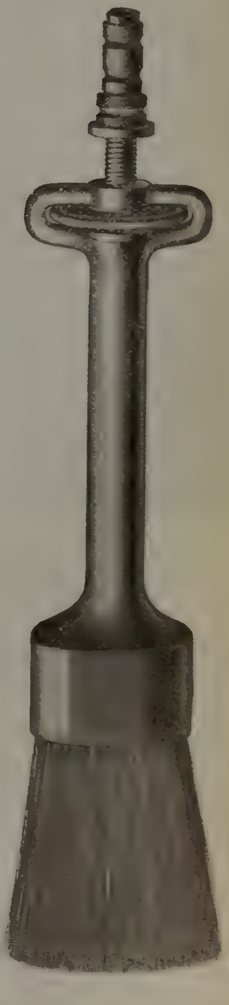
The outfit is also made with a tank to be strapped on the back which will cost $2.50 extra.

Our booklet will tell you why. Write for one to-day. Send in your order. Your outlay will only be once. Apparatus will last a life-time. Let us know to-day what you are manufacturing and we will effect a saving for you.

Jobbers and Dealers wanted everywhere.

Standard Automatic Manufacturing Co.

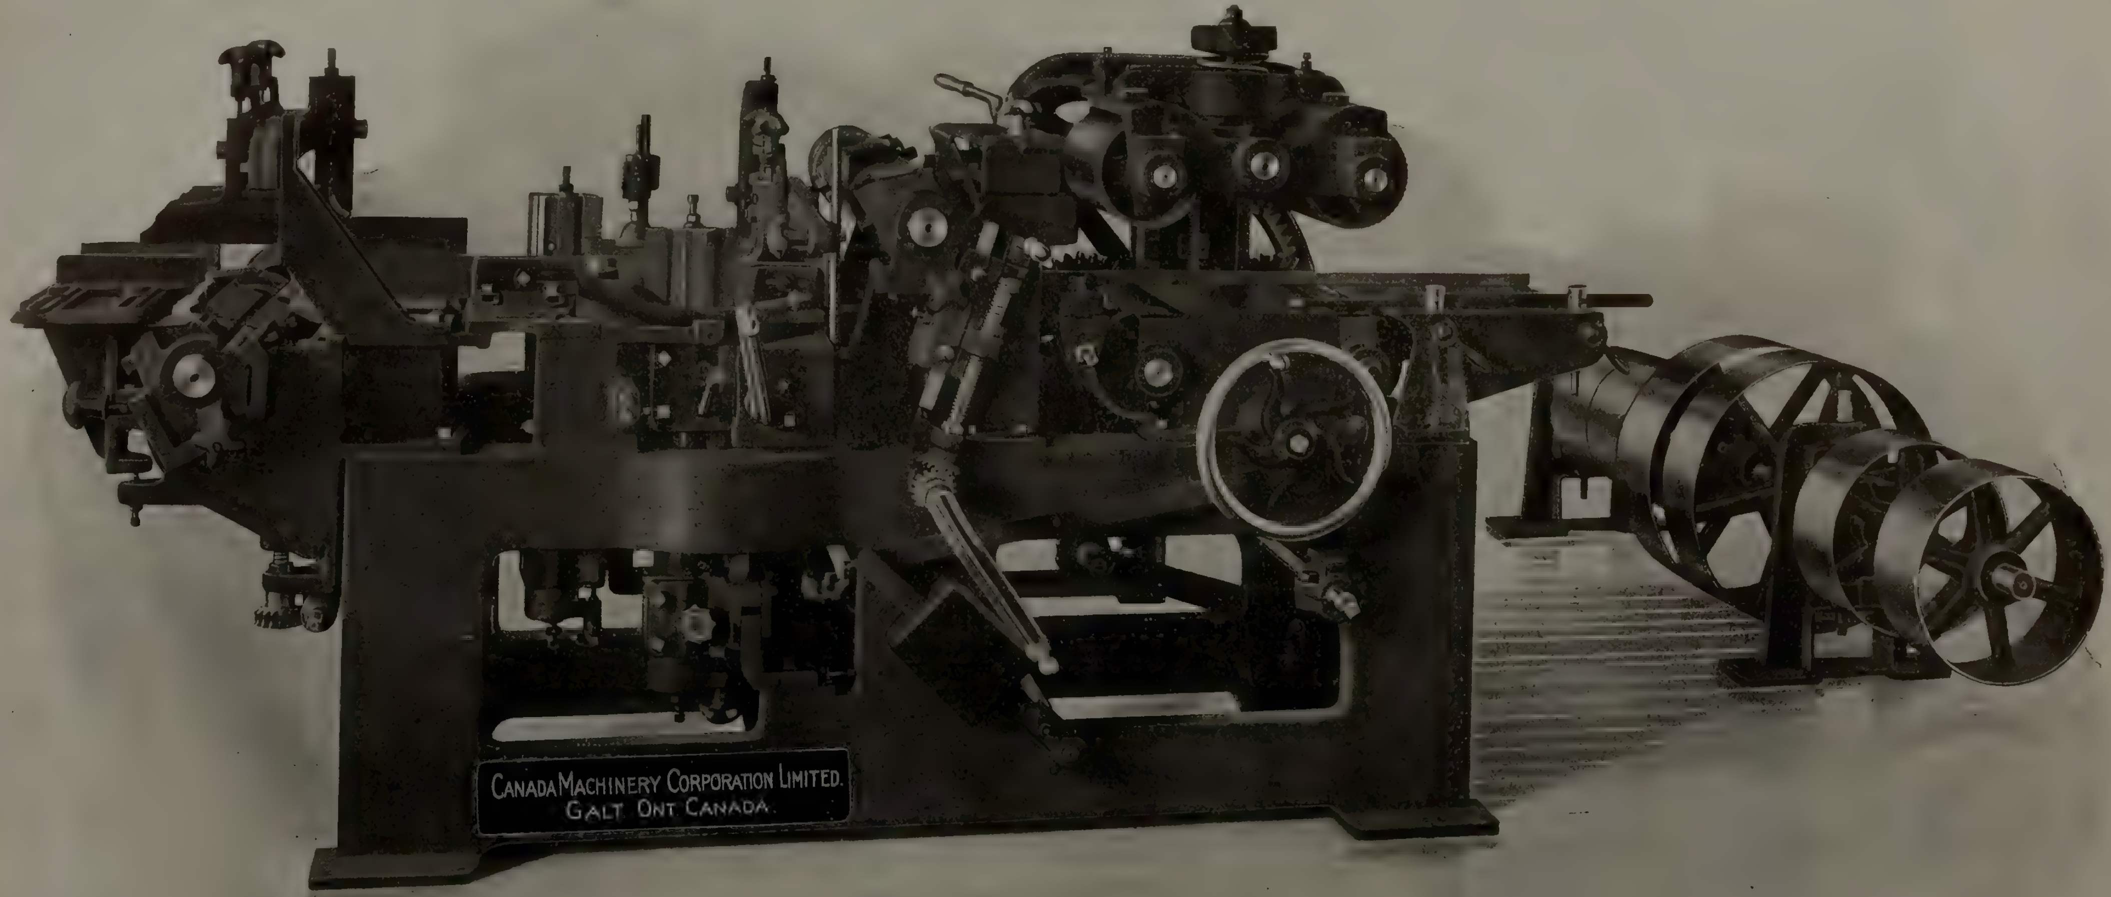
50 Church Street NEW YORK



Number 303 Open Side Moulder

Are you making a profit on your mouldings?
May be YES! May be NO!

It is worth your while to look into this question
We can probably DOUBLE your OUTPUT



Does Excellent work at **75 feet** per Minute

- Frame cast in one piece
- Working parts free of access
- Large feed Rolls driven with Cut Gear

- Frame has no vibration from Countershaft
- Cutter Head Spindles of large diameter
- Combines all good points of an inside and outside Moulder

Let us give you further particulars

Canada Machinery Corporation Limited, - Galt, Ontario

There are more DISSTON Brand Band and Circular Saws used than any other make and by a large majority

WHY?

Because millmen and sawyers recognize by the use of the Disston Saws they obtain the greatest results for the least cost

We make this statement without fear of successful contradiction

Points of Merit

Material	Disston Crucible Steel	Uniformity. Toughness. Greatest Tensile Strength and Elasticity.
Hardening AND Tempering	Disston Method	Being manufacturers of our own steel, and thoroughly familiar with its make-up, we are able to absolutely adjust the hardening and tempering processes to the degree giving that perfect combination of hardness and toughness that produces the "edge, tension-holding and standing-up qualities" for which the DISSTON SAWS are renowned.
Grinding	Disston Method	By the DISSTON METHOD all Band Saws are ground perfectly flat and uniform in thickness, thus making possible a very close adjustment of the guides without creating any friction or heat when in operation at the highest rate of feed; and all Circular Saws whether tapered or of even thickness are perfectly flat ground on the surface, thus insuring in all saws perfect clearance and true balance.
Tensioning	Disston Method	The uniformity of the material, temper and grinding is a large factor in the proper adjustment of tension; and this, together with the Disston process of tensioning is the reason why the DISSTON SAWS will manufacture more lumber, under the same conditions than any other brand of saw.

In the DISSTON BRAND OF SAWS you have the advantages of the product of a progressive, up-to-date saw factory, the LARGEST IN THE WORLD, and where saws are made throughout, from the making of the steel itself —the superiority of which has been demonstrated for the past fifty-five years—to the finishing operation, each process being performed by mechanics of long experience and highest order of skill.

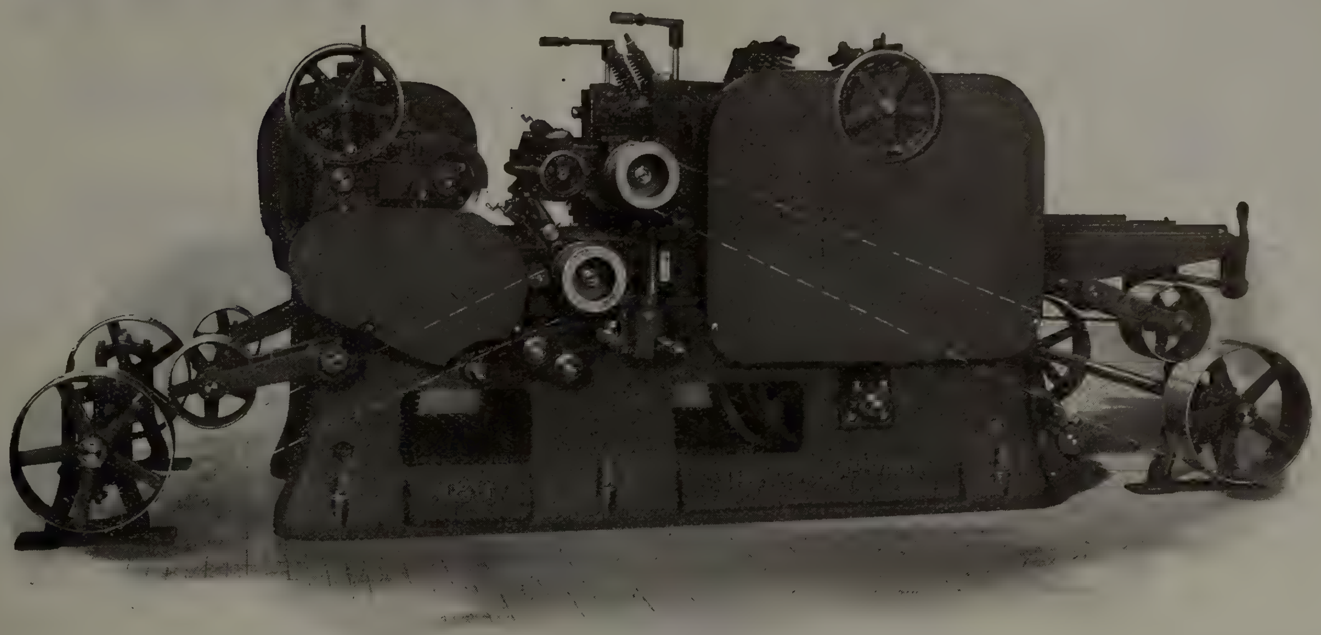
"Berlin" Surfacers



Berlin Surfacers are built for the use of thin knives. A few years ago the significance of such a statement would hardly have been appreciated. To-day, the man who turns out the most lumber in the shortest time, who gets the most from his lumber and his machines, who gets the finest finish, is the man who uses thin knives.

Pyts Steel, used exclusively on Berlin machines, is the one self-hardening steel made to-day which possesses the requisite toughness combined with the right amount of hardness, for the successful use of thin knives.

Thin knives are set at a greater angle than the ordinary thick knives, consequently more of a "scrape" is secured. This is further effected by back-bevelling to suit the nature of the wood being worked.

With Berlin thin knife heads, devices are used which grind the knives without disturbing the setting. The heads are then set in motion and jointed or brought to a perfect cutting circle so that each knife does its share of the work.

Thin knives actually make better work possible and will raise the grade from ten to twenty per cent.

The No. 186 is a fast feed matcher with the side-head spindles left out. It is also short-coupled and has six large feed rolls. Belt tighteners are provided for both top and bottom heads—no chance to "stall" them no matter how heavy the cut.

The No. 186 has the capacity of four ordinary surfacers and will produce a finish at 150 feet per minute that cannot be equalled short of a cabinet surfacer at 30 feet per minute. It is built in two sizes—20 in. or 30 in. wide with a 6 in. opening.

The top and bottom heads are very close together—warped and crooked stock can be better and more easily surfaced.

This surfacer gives the satisfaction which prompts the purchase of other Berlin machines.

Order Your GANG SAWS Early

This is the time of year when mill men begin their repair work for the coming season. Better order your Gang Saws right away and order them from us because

We specialize in the Manufacture of GANG SAWS

The **Steel** that is used in our GANG SAWS is manufactured especially for these Saws on account of its **Toughness, Durability** and the length of time it keeps its **Keen Cutting Edge.**

By using our GANG SAWS you will NEVER have any trouble with the corners of the teeth breaking off when swaying.

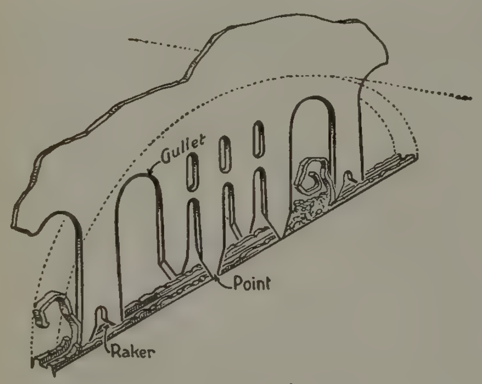
The above qualities are the most essential points in GANG SAWS.

Before placing your orders write us for further information and prices.

We manufacture all kinds of Saws, and solicit your enquiries.

R. H. Smith Company Limited

St. Catharines, Ont.



Why Atkins Sterling Saws Run Free and Easy

Saws that depend on "set" for clearance have to tear their way through the timber, like the picture to the left. The teeth are sprawled out on either side and chatter and stick and bind and tear. That's why wood sawing is sometimes considered such hard work. That's why commonly ground saws can NOT run fast or pull easy.

ATKINS SEGMENT-GROUND CROSS-CUT SAW BLADES are ground thinnest on the center of the back. The teeth are the widest part, and the blade drops easily into the smooth cut which is made by the saw teeth. Very little set makes the teeth cut clean and the rakers clear the center. See the picture to the right. These Saws merely require enough power to pull them back and forth. That's why they run so easily.

ATKINS STERLING CROSS-CUT SAWS are the only Saws that are Segment-Ground, and for this reason are guaranteed to run easier and cut faster than any other Saws. Write us for free information, or order through your jobber or dealer. If they won't supply you, let us know.

With the Spindles running 9000 revolutions per minute in Phosphor Bronze Bearings with continuous Oil Flow, the best results on our

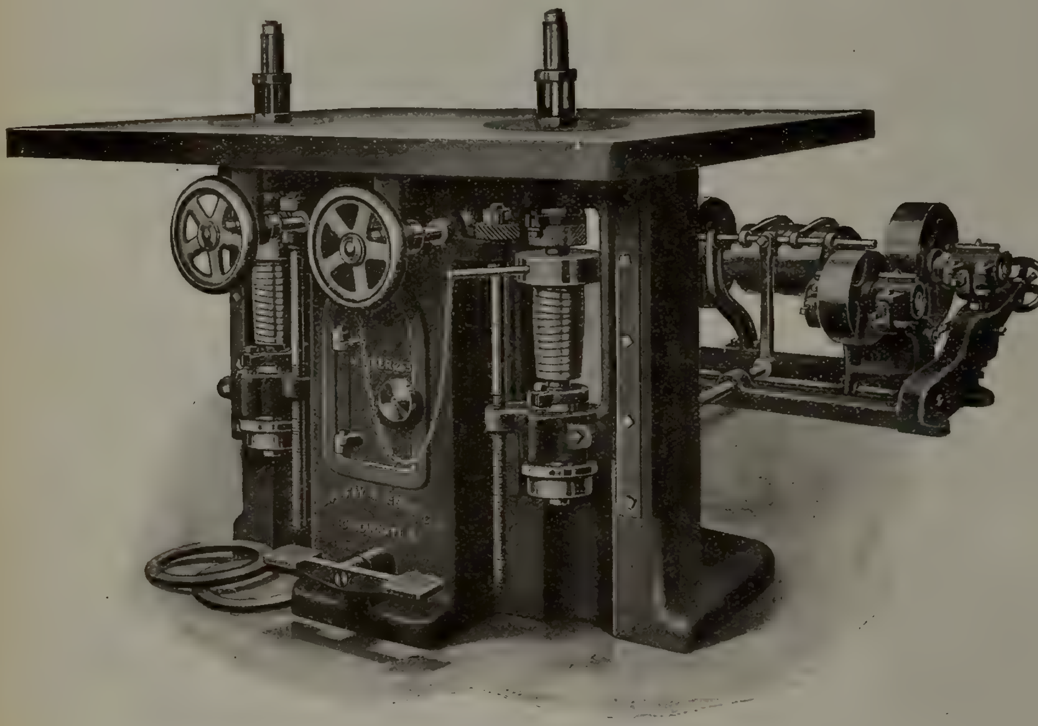
No. 265 Double Spindle Shaper

are attainable

It takes high speed to make a good shaper, and it takes a good machine—good material—good workmanship and good principles of construction to stand a speed of 9000 revolutions per minute.

We have a book called "Section L" which shows our machine in detail. Copy sent free to you gladly.

An item of great value in the construction of our Shaper is the countershaft. It's made like the machine itself—heavy, universally adjustable and with double pulleys to insure perfect tracking of belts—very necessary on a high speed machine.



No. 265 Double Spindle Shaper

Referring to our book again—get it please—it only costs a postal to bring it. State where you saw the ad, so we will make no mistake by sending you the wrong book. **"Section L"** is the one.

Isn't it Better to Investigate

"The HOWARD" Vulcanizing Process

than to wish you had

Positively the quickest and most economical system known for drying and Preserving Lumber, Railroad Ties, etc.

POINTS IN ITS FAVOR:

Does away with all kilns
Improves quality of all lumber
Increases the crushing strength
Increases the transverse strength
Reduces the weight 30 per cent to 45 per cent
It materially prolongs the life of wood
Eliminates shrinking, swelling and warping
Emphasizes and beautifies natural grain of the wood
Makes fit for commercial use woods not otherwise merchantable
Does away with necessity of maintaining heavy stock of lumber in yards
By this process green lumber taken from the log can be used for building purposes in 2 or 3 days

---

We invite Lumbermen and Owners of Woodworking establishments to see a practical demonstration of the process at our plant in Toronto

4-SAW LATH BOLTER

Lath Bolter

4-Saws

Here are a few of the important features:

The frame of this machine is made solid in one piece and all bearings for mandrel and feed roll shafts are cast solid in frame, with the exception of the mandrel bearing outside of saws, which is removable for taking out saws. This bridge, when in place, is held securely in alignment on planed surfaces by large cap screws with wrench handles. Frame is supported by two stands with planed surfaces, and securely bolted.

The front and rear pressure rollers are power driven.

The front pressure roller raises towards the saws and being power driven, prevents any pieces from flying back out of the machine.

The end bearing may be easily removed, which permits the saws being taken off the mandrel for filing. This does not disturb the mandrel.

Manufacturers of

Saw Mill, Shingle and Lath Machinery and Accessories.

Engines, Boilers and Steam Pumps, Transmission Machinery.

Full Particulars Given on Application.

Heavy Duty Lath Machine

This machine is built very strong and substantial, and will suit any mill, large or small where a large output of lath is required. The top or main frame is made in one casting, and is supported by two heavy iron stands, well braced, which makes a very rigid machine.

The bearings on either side of drive pulley are solid in frame, while the third one is so arranged as to be easily removed for the taking out of saws. This bearing, or bridge, when in place is kept in perfect alignment on planed surface, by large cap screws with wrench handles.

"No Heat - No Work - No Lost Motion"

THE TROUT POWER SETWORKS

Positively the Most Powerful, Accurate and Efficient Setworks Built.

The Trout Power Setworks is rope-driven. It combines a set and receding works in one machine and will turn out more lumber and better lumber than any other setworks on the market.

JUST FOR THESE REASONS:—

¶ There are only two levers to operate.

Setting is accomplished without stooping or bending.

There is no heat from the steam cylinder.

¶ There is nothing to tire the setter.

He can give his undivided attention to the sawyer's signals and cut as much lumber at the end of his shift as at the beginning.

¶ Working parts throughout are of finest selected steel.

The operation is without rack or jar, eliminating any destructive wear.

No lost motion can possibly develop.

¶ The setworks will set by 1-32 inch up to 6 inches at one manipulation of the lever.

The size of the logs does not affect the speed or the accuracy of the set.

¶ Further, the machine is entirely self contained.

It requires no change in the carriage frame.

Can be attached to any size of carriage, Rack or Screw movement.

¶ We are the sole builders of this machine. Perhaps you have seen it at work. If not the best thing to do is to visit us or to write for a fuller description than we can give here.

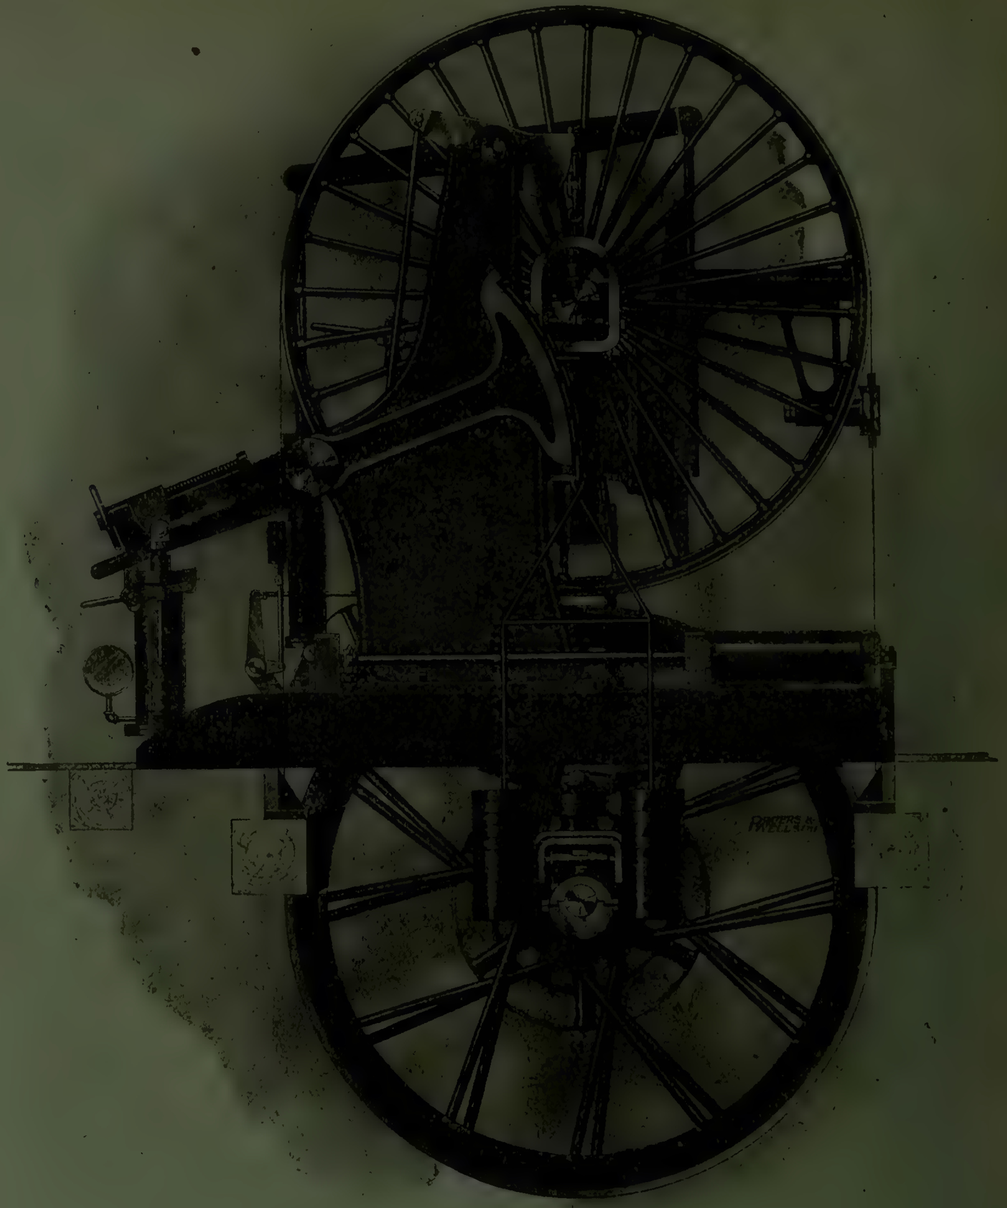
B. J. COGHLIN & CO., Limited ∵ ∴ **MONTREAL**

Annual Review Number

The
Steam Tension
Band Mill



is made with 8 foot, 9 foot and 10 foot wheels. As you know, the top wheel and upper guide are operated by separate steam cylinders.

Some obvious advantages of this are, the great speed with which the guide can be raised and lowered, the extremely sensitive tension on the saw, and the quick time with which saws can be changed.

You will see at once that considerable time is saved in one day, over the usual weight tension mill.

And no tensioning system has yet been made, that is as sensitive as our steam tension; so that your saw is more easily kept in perfect shape and at the right tension at all times — which means better lumber.

Any mill which will increase your cut, and probably improve its quality is worth your while looking into; and besides, there are other special features which increase its value to you.

Shall we send our catalogue?

William Hamilton Company, Limited

PETERBOROUGH - ONTARIO

RED and WHITE PINE

Saw Mill at Cache Bay, Ont.

Right in the heart of Northern Ontario's pine forests

our lumber camps are busily engaged taking out the finest

White and Red Pine Timber

for next season's cut.

Dealers who appreciate good lumber, the kind that makes customers and holds them, should lose no time in letting us know their requirements.

Our lumber is noted for being perfectly milled and properly graded.

Always write us when in the market for White or Red Pine, rough or dressed

440 Square Miles Timber Limits

on Georgian Bay

To be Sold by Private Sale in Large or Small Blocks.

On account of their President and Principal shareholders being engaged in other large enterprises, and not having the time to give to them all, THE PARRY SOUND LUMBER COMPANY, Limited, offer for Sale all of the timber lands, mills and town property situated in the Town of Parry Sound; also Tug Scow and full Camp Equipment for five camps, including boom chains, snow plows, sleighs, etc.

THE LIMITS TO BE SOLD

comprise some 440 square miles of licensed and deeded Pine, Hemlock, Spruce, Birch and other timber. The licenses from the Ontario Government include all timbers and are not restricted for time. Government dues are as follows: Saw Logs, White Pine, $1.50 per M. ft., B.M. Saw Logs, Hemlock, Tamarac and other woods 75c. per M. ft. The timber is situated in the Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street. The Canadian Pacific, Canadian Northern aud Grand Trunk Railways run through the limits, which makes some of the parcels offered for sale particularly desirable for small mill owners.

A circular giving full information, maps, terms and conditions of sale will be furnished upon application to

Pine Doors

We have long appreciated the fact that price is not the only requisite a dealer must seek in placing his order for doors. Poorly manufactured doors can scarcely be considered a bargain at any price.

Door Making is our Specialty

We have equipped our plant with the best door machinery made, and we are turning out doors that **are right in quality and right in price.**

Our doors need no commendation. They prove themselves. They are business builders for every dealer who handles them.

If you have not received our latest quotations on Doors, Sash, and Interior Trim, write us to put you on our mailing list. It will be mutually advantageous.

Why Atkins Sterling Saws Run Free and Easy

Saws that depend on "set" for clearance have to tear their way through the timber, like the picture to the left. The teeth are sprawled out on either side and chatter and stick and bind and tear. That's why wood sawing is sometimes considered such hard work. That's why commonly ground saws can NOT run fast or pull easy.

ATKINS SEGMENT-GROUND CROSS-CUT SAW BLADES are ground thinnest on the center of the back. The teeth are the widest part, and the blade drops easily into the smooth cut which is made by the saw teeth. Very little set makes the teeth cut clean and the rakers clear the center. See the picture to the right. These Saws merely require enough power to pull them back and forth. That's why they run so easily.

ATKINS STERLING CROSS-CUT SAWS are the only Saws that are Segment-Ground, and for this reason are guaranteed to run easier and cut faster than any other Saws. Write us for free information, or order through your jobber or dealer. If they won't supply you, let us know.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 31 Toronto, February 1, 1911 No. 3

The Tariff Proposals—Free Lumber

It is yet too early to draw any definite conclusions about the tariff changes which are included in the treaty which has just been arranged at Washington between representatives of Canada and the United States. Although the agreement has been reached, past experience teaches us that there is still a long road to be travelled before the completed agreement can be definitely put into operation. The Parliament of Canada and the Congress of the United States have each to add their sanction to the agreement.

The feature of the treaty arrangement which interests the lumber trade of Canada more than anything else is the placing of rough lumber and timber on the free list. For many years past, Canadian producers of lumber have been laboring under the disadvantage of a tariff on rough lumber entering the United States, while rough lumber manufactured in the latter country has been coming into Canada free of duty. Thus our markets have been invaded by United States lumber whenever trade conditions were dull in that country. Even in times of good business activity the amount of United States lumber which came into Canada was sufficient in a great many cases to keep down the price of our own lumber, and so make the business of manufacturing lumber in Canada much less profitable than it would have been with the imposition of a moderate tariff.

In the face of this condition of affairs, Canadian lumber manufacturers were obliged to face a duty until a year and a half ago of $2 a thousand feet on rough lumber entering the United States. On Aug. 5, 1909, the duty was reduced to $1.25 a thousand feet, at which figure it has stood up to the present. Canadian lumbermen have made frequent representations to the government against the injustice of this one-sided tariff situation, but have been unable to persuade the government that they were entitled to the imposition of a duty on rough lumber entering Canada, equal to that charged against Canadian lumber entering the United States. In most of their arguments for a duty, Canadian lumbermen have intimated that, if the duty on lumber entering the United States from Canada were removed, they would be as well pleased as if a countervailing duty were placed upon United States lumber entering Canada. This is exactly what will come about if the new tariff treaty is put into effect, and it is believed by lumbermen in Canada that it will be a distinct advantage to them.

The increase in the duty on shingles of 20 cents per thousand, which was made in August, 1909, and which has been an important factor in the depression of Canadian shingle markets of late, is to be removed under the new arrangement, and the duty placed again at 30 cents per thousand. A reduction of 10 cents per thousand in the duty on laths entering the United States is also proposed, which will place the duty at 10 cents per thousand.

In regard to paper and pulp, a tentative agreement only has been reached, under which these products will be admitted free across the border, if the provinces of Ontario and Quebec, which at present prohibit the export of pulpwood cut from Crown lands, see fit to withdraw this prohibition. Inasmuch, however, as this prohibition in each province is the result of a well-settled policy for the protection of the natural resources of the country, it is inconceivable that any change will be made, and the duty on pulp and paper will for the present remain unchanged.

The details of the proposed changes so far as they affect the lumber industry of Canada, are published elsewhere in this issue.

Pulp and Paper—A Word of Warning

The extensive development of the pulp and paper manufacturing business in Canada, which is at present in progress, though a matter of satisfaction to all who are interested in the growth of the manufacturing industries of Canada, should cause those who are interested in the country's financial and commercial welfare to consider the situation critically. Almost every day one hears of the proposed erection of new pulp and paper mills, or the formation of new companies to manufacture pulp and paper. Although the Canada Lumberman seeks always to take an optimistic view of business affairs, it becomes a duty at times to sound a note of warning. In the interest of the pulp and paper manufacturing industry, the present situation demands the utmost caution and conservatism.

One of the most important influences which have led to the increase in the number of pulp and paper mills in Canada of late has been the attention which has been given to the growing scarcity of pulp wood in the United States. The same factor contributed largely, also, to the action taken by the government of Quebec, in prohibiting the export of pulp wood cut from Crown lands of the province. With the large pulp wood areas in the province of Quebec, it was to be expected that there would, as a result of these factors, be a considerable awakening of interest in the pulp and paper manufacturing industry. With its splendid water powers, this province is particularly well situated for the production of pulp and paper.

The necessity for caution at present arises out of the multiplicity of companies which have been formed or are under consideration. It is in the news paper section that the greatest caution is called for. To name a few of the largest concerns that have been reported within the last few months is sufficient to indicate the great extent to which capital is being directed towards this industry. It should be borne in mind, moreover, that this list is in no way complete, there being many other mills projected, and even in course of construction, in various parts of Canada—small and unreported—but all acting as factors in the general trade conditions. The list of large new concerns includes the following:

Grand Discharge, Lake St. John; 500-ton mill to be erected by the Mackenzie and Mann interests.

La Tuque, Quebec; 400-ton mill to be erected by St. Maurice Industrial Co.

Three Rivers, Quebec; 100-ton mill to be erected by the Wayakamite Co.

Three Rivers, Quebec; 40-ton mill to be erected by the Union Bag and Paper Co., a branch of a concern at Sandy Hill, N. Y.

Riviere aux Sables, Quebec; Price Bros. erecting a 150-ton mill.

Murray Bay, Quebec; 100-ton mechanical pulp mill to erected by the Eastern Canada Pulp Co.

Grand Falls, N. B.; large mills to be erected by Sir Wm. Van Horne.

Lake Superior; million dollar paper plant proposed.

Powell River, B. C.; 100-ton news mill to be in operation next fall.

Espanola, Ont.; 200-ton news paper mill; four machines being added to their present plant by the Spanish River Pulp Co.

The industry itself, indeed, is not the only thing which is to be considered. The public who subscribe for shares in such companies are the ones in whose behalf it is most important to be cautious. There have been some rich dividends received by shareholders in pulp and paper companies, notable among them being the 20% of the Laurentide Pulp and Paper Co. The investing public have a strongly developed speculative bump, and it is an easy matter, sometimes, to get them to take a flyer in a new company on the strength of big profits which have been made by others in the same line of business. Mention of the numerous oil and wireless stocks which have bitten the public of late is enough to bring this point home.

Timber Trade of Ontario During 1910

An Increase of Seventeen Million Feet Shown in Output—A Year of Uncertainties, and a Better Trade than was Expected

The lumber trade of Ontario, like that of the rest of Canada, passed through several well-marked periods of economic change during the year 1910.

It will be well remembered that the year opened with a fairly hopeful feeling among lumbermen, and affairs progressed at a fair speed until the time arrived when the attitude of the United States had to be determined upon the tariff question. Then there developed a rather unnecessary amount of agitation among Canadians upon that phase of the situation. Taking the year as a whole, it was notable for the great amount of vacillation which was displayed by the various lumber trade interests in different parts of Canada and the United States. There seemed to be recurrent periods of apprehension, for no apparently good reason, as results turned out, but probably at the time for reasons that seemed more or less definite.

Following the unsettled state of the market in the winter and early spring, the trade had scarcely recovered from these conditions when warnings were issued by the banks against over-expansion. Notwithstanding that, business was good right up to midsummer, when the period was reached in which there is inevitably a little lessening up of orders at vacation time. Added pressure was put upon the trade in the shape of these admonitions from the banks. The apprehension thus engendered was, however, safely survived, and the lumber trade met with a fairly good, continued demand. The trade had not been long on its feet, however, when it met with trouble in the United States again, in the shape of the political conditions which preceded the elections in the fall. The possibilities of the political situation in the United States, meaning as much as they did to the lumber trade of Canada, were naturally watched with keen interest. Trade in the United States fell off because people were uncertain as to the future. The elections vindicated the judgment of the rank and file of the common people that certain changes were in order in the political household. These conditions have been reflected in political and business life on this side of the line, but the conviction has been forced upon us that, no matter which party is in power, the normal demand of the country has to be satisfied.

Concurrent with these political upheavals was the decision on the part of the investing interests that returns, particularly in connection with the railroads, demanded close scrutiny. At the same time there appeared a movement among the railroad managers to clearly state their position to the public. This situation undoubtedly influenced the railroads greatly, and persuaded them to adopt a policy of retrenchment and curtailment, as much as possible. The railroads being large consumers of lumber, the trade found itself without the large fall trade whch it looked forward to regularly, and had to shape its course accordingly. In the face, however, of all the apprehensions which were felt on this score, the railways bought more lumber than they had led the trade to expect. The sum total of their business for the year was, in fact, so satisfactory that, when the year rounded off, it was found that the volume of business had not been bad in that respect.

The great competitor of Ontario woods, the yellow pine of the Southern States, continued in an unsatisfactory trade condition all the year through, and gradually brought certain lines of white pine down in price, until they reached the level where they could definitely compete with it and supplant it on its own ground, but beyond clearing the air of these particular items, it is doubtful if this has been of any great value to the trade. Those who are in touch with the southern pine situation to-day believe that it is in a little better condition than it was a year ago. The volume of business in yellow pine is certainly equal to what it was a year ago.

Summing up the year in the lumber trade, it was above all else a year of turmoil and surprise, but the greatest surprise of all was that, in the face of the many bogies that rose up, and of all the clouds that hovered on the horizon, the year rounded off with results that were beyond what might have been expected, if these causes of fear had been as bad as they seemed in advance of the actual experience. The peculiar thing that impressed lumbermen all through the year was that they did not share, in the same degree as other leading lines seemed to share, in the general good business of the country. It seemed to be their lot to meet peculiar exigencies that affected them more than any other lines of business, notably, the special circumstances that arose out of the tariff, the restrictions recommended by the banks because of the close relation of lumber to real estate and construction, and the uncertainties caused by the attitude of the railways. In no other line, perhaps, with the exception of the steel business, has the influence of these factors been so forcibly felt. In other words, the lumber business has been behind other business in prosperity all through the year.

As to the export situation, the Canadian business has always been a large factor in the export of lumber, and for the last two or three years the export market has not been what Canadian exporters would have liked. Contrary to expectations, however, the export trade improved steadily throughout 1910. In some lines, in particular, it was very good. As to the general outlook for the trade, the indications are that it will continue to be good, and that we are in for a better year, in probably every line wherein lumber is affected. The demand in the United States is certainly better than it was, and it is also good in Ontario for this time of year. The hemlock situation is about the only unsatisfactory spot. It is not quite so hopeful as it should be, but there are a good many people in the trade who are finding out what it costs to turn a hemlock tree into lumber and put it into the hands of the consumer. This is a hopeful sign, and it means that there will probably not be so much hemlock put on the market this year as there has been heretofore. This means that the hemlock manufacturers may be enabled to get back a new dollar for an old one, even if they do not make any profit.

The vacillating nature of trade during the year was one of its most noticeable features. The situation to-day, however, compared with that of a year ago, is materially improved. The most important feature of the change is the fact that in a good many lines there has been a steady and satisfactory cleaning up of stocks. But stocks were fairly low a year ago also, and the prospects then were good for the year 1910. At the opening of the year, trade was very active, and it continued so for the first five months of the year. The building trade promised well, and there was a brisk demand for nearly every class of lumber.

The first condition which militated against the continuance of good trade in 1910 was the late and cold spring. This held back the opening of the heavy building season, and practically brought the lumber business to a standstill. It is not going too far, in fact, to say that the business of the year did not entirely recover from the setback which it received in the spring.

In spite of a temporary falling off in business, so far as the quantity was concerned, there was a saving feature in the improved demand for the low grades. Low-grade pine moved pretty rapidly during the latter part of the year, and 1911 opened with no serious surplus of this class of lumber on the market. The better grades of pine were in fairly good demand throughout the year, and were picked up pretty closely during the autumn.

An important feature of the market was the behavior of hemlock. A large amount of hemlock changed hands because of the low prices during the latter part of the year, and as a result the market has been slightly improved. The majority of the firms having hemlock for sale have recently been able to put their prices up, and have been doing a fair business at the advance. An important factor in preventing improvement in hemlock from occurring earlier in the year 1910 was the strong competition of yellow pine, which came into Ontario at low prices and secured a large amount of the business.

Taking 1910 as a whole, it was something of a housecleaning year, so to speak. With a very fair home market, it was possible to dispose of more of the low grades than usual. During the autumn there was also a fair amount of cull lumber shipped to the United States. The box trade on the other side was good, and it consumed a fair share of Ontario lumber. This was an important factor in the improvement of the market for cull lumber in Ontario. Culls to-day are reported to be picked up pretty close, and there is no apparent surplus. Generally speaking, pine lumber to-day is stationary, and is holding its own well. There is at present no indication of a drop.

Norway lumber also improved during 1910. Its prices have advanced several dollars per thousand above the profitable prices which were current a year ago. During the year 1909, Norway pine was being sold at less than the cost of production. Since the improvement in the demand which commenced a year ago, it has practically come into its own, and dealers are inclined to believe that its prospects are encouraging. The improvement is practically the result of the improvement in the home trade, and the active building business has had most to do with it.

Car decking was a line that was picked up well during the last quarter of 1910. The revival of the railroad demand for lumber was a strong feature in the general improvement. Car decking stocks to-day are well bought up, and are largely in the hands of the wholesalers.

The shingle trade had an unsatisfactory year's trade. Shingles started off well enough, at high prices, but towards the middle of the year the manufacturers on the coast commenced cutting prices, and they went very low. During the last month or so, however, there has been a tendency towards improvement, and prices have advanced. It was demonstrated very clearly during 1910 that the market for British Columbia shingles was the most unsatisfactory part of the whole trade. The uncertainty which continually prevailed about the future course of prices frequently demoralized trade. Even when prices improved, as they have been doing lately, this same uncertainty restricted the volume of trade.

Lath during 1910 went along on a pretty even keel, and the prices to-day are practically the same as they were a year ago.

Spruce also went through the year in an uneventful manner. The prices to-day are practically those of a year ago. If there is any difference it is in the nature of a slight advance. Quebec spruce in Ontario is higher than it was a year ago, and the demand is good. The building trade has been using up large quantities of spruce, especially for flooring.

Considering the conservative nature of the trade in 1910, and the indications for no more than an average cut of logs in the woods during the present winter, it looks as though the year 1911 ought to be a good one. The general prosperity of the province, like that of the whole of Canada, is much greater than it has ever been in the past. The expansion in trade and the rapid growth of the country will make a market for an increasing quantity of lumber. Over-expansion alone seems to be all that can interfere with trade conditions in 1911. With the experiences of the last few years as a guide, however, the danger of over-expansion is not great, and so far as the lumber trade in Ontario is concerned, over-production is not to be feared.

The following tables show the production of lumber, lath and shingles in the Georgian Bay and New Ontario districts. The figures show an increase of about 17.000,000 feet of lumber and an increase of about 6.000.000 pieces of lath. Shingles show a decrease of a little over 6,000,000 feet.

Georgian Bay and Northern Ontario Lumber Production.

The lumber production in Ontario, exclusive of the Ottawa Valley, was as follows, during 1910 and 1909:

	1909. Feet.	1910. Feet.
Ahmic Harbor	700,000	500.000
Bellevue	200.000	300,000
Berkeley	2.000,000	2,000,000
Berlin	1,300,000	1,200.000
Biscotasing	5,000.000	6.000,000
Blind River	48,000.000	51,000,000
Bracebridge	12,250,000	14,050.000
Bridgenorth	1,500,000	1,250.000
Bruce Mines	....	5,000,000
Burk's Falls	3,600,000	3,100.000
Burriss	500.000	600,000
Callendar	2,000,000	1,500,000
Chapleau	1,500,000	1,750,000
Chesley	200.000	175,000
Collingwood	750.000	2,600,000
Collins' Inlet	5.600.000	4,800,000
Cutler	28,446,000	38,833,000

Output of Logs During Present Winter.

When the present winter commenced, the indications were that the lumbermen of Ontario would possibly reduce the amount of their woods operations, as compared with last winter. Reports received were to the effect that several of the larger companies had decided to cut a smaller quantity of logs than in the previous winter. In the course of a month this estimate had to be revised somewhat, and it was evident that the operations would be at least as great as the
been in the winter of 1909-1910. Since the operations have

expected in the cut of cordwood by the charcoal manufacturers. Considerable less pulpwood is being cut on Crown land concessions, a decrease of 38,000 cords being looked for. The cut is estimated at 100,000 cords. The growing market for railway ties as a result of increase in construction is shown in the estimate of the cut of timber for railway ties. The output is figured at 4,919,000 pieces, an increase of 1,119,000.

Georgian Bay and Northern Ontario Shingle Production.

The shingle production in Ontario, exclusive of the Ottawa Valley, was as follows, during 1910 and 1909:

Ottawa Valley Lumber Production

Ottawa, Jan. 27.—The output of the Ottawa Valley for the year 1910 was a little over the 540.000,000 mark. While a number of the larger firms dropped a few million feet from their records of the year before, the number of new firms and the increase of J. R. Booth's cut more than made up for it. J. R. Booth cut about 85,000,000 feet during the year just closed. While this was only 5,000,000 more than in 1908, it was very substantially greater than in 1909. The spring freshets of that year interfered materially with the cut of that firm. The W. C. Edwards Co. kept up the same output as the year before, namely, 80 000.000 feet. McLachlin Bros. cut about the usual amount, and the other large firms cut about the same as the year before.

Shepard & Morse were 3,000.000 less than the year before, when they made a marked increase over 1909.

The Fassett Lumber Co., Ltd., increased their output by 4,000,000 feet over 1909, and expect to have a large output this year.

The Riordon Paper Co. absorbed the Perley Lumber Co. during the year, and exceeded the cut of that company by 1,000,000.

An important decrease was in the case of the Colonial Lumber Co. of Pembroke. The Upper Ottawa Improvement Co. failed to deliver logs sufficient to keep up their standard for the year before. The company, however, expect again to come up to their usual production of 20 000,000.

The new firm, A. & F. Fraser of Pembroke, while cutting considerable stock for Fraser & Co., also cut about three and a half million feet for themselves.

The mill of Ferguson & McFadden, of Renfrew, situated at Jocko,
ther about 16,000,000 feet during the year, of which 10,000,-

prices of lumber remained pretty steady.
ced somewhat. but was more than counter-
er varieties. The United States market was
fore. The demand since the new year
much better. There was a considerable
rough the United States in bond during
This trade was good.

The British trade in deals was fair all year, and there is considerable advance in the price of the best qualities in recent contracts.

The local trade remains about the same. R. & T. Fraser, who have for some years back sold their entire output to the Fraser-Bryson Co., have contracted for their output this year at substantially the same prices as the year before.

Sales of shingles were slow, but lath are now growing firmer. The output of these two varieties was about the same as the year before. The output of railway ties was large this year.

Manufacturers announce that as a rule their stocks are pretty well sold out. A number of firms have moved off their mill culls recently.

Reports indicate that the activity this year will be greater than the year before. There has been an excellent logging season in the woods, and the log cut in nearly every case this winter has been as great if not greater than in the winter before.

The following tables show the production of lumber, lath and shingles of the Ottawa Valley for the years 1910 and 1909:

Ottawa Valley Lumber Production.

	1909.	1910.

Elsewhere in this issue will be found the new advertisement of the Imperial Timber and Trading Co., Ltd., of Vancouver, B. C. This firm have one of the largest wholesale and export businesses on the Coast, and have exceptional facilities for handling all classes of lumber and shingles produced in British Columbia. They give especial attention to Eastern Canada trade, and are one of the few firms who can supply very long, heavy fir timbers at short notice. Write this firm when you require British Columbia products.

A movement is on foot to establish a local forestry association, with headquarters in Cranbrook, B.C. The leading lumbermen of the district feel that the time is ripe to organize such an association to watch over and promote the best interests of the lumber industry.

Hardwood Trade Had a Good Year

Furniture And Implement Trades Consumed Large Stocks—Building Trade Taking More Hardwood Than Formerly

The year 1910 in the hardwood trade of Canada opened with the usual lull in the forepart of January, but the trade soon began to feel the beneficial effects of the partial reduction in the United States duty on lumber. The reduction afforded an opportunity to Canadian producers to enter into competition with the producers of Wisconsin and Michigan. An important feature of the trade in the early part of the year was the advance in the price of oak, which created a demand for a considerable quantity of birch. It was then demonstrated pretty thoroughly that the stock of birch was small. Until the new stock commenced to come in, the price of birch was therefore very strong. The difficulties which were experienced in the woods operations last winter caused a considerable shortage in the cut, and this served to maintain the prices of hardwood practically all through the season of 1910.

The furniture trade and the implement trade in Canada were very active all through the year 1910. Consequently they were extensive buyers, cleaning up, in the Canadian woods, large quantities of thick maple, birch, basswood and soft elm; while the very active trade in building lines cleaned up practically all the thin stock in maple and birch, even to the low end, for the manufacture of flooring.

The trade with the United States, so far as the Canadian exporters were concerned, was very strong in the early months of the year, owing to shortage of stock, but as the season advanced, the unsettled political situation in that country caused buying to be largely of a hand-to-mouth character. People who were in the habit of buying en bloc bought car lots for immediate requirements only. This continued to be the feature of the United States trade all through the season. As a result, the shipments to the United States were greatly curtailed for the year. The advance in prices during the year was partially offset as a benefit to the manufacturer, because the cost of making sales was proportionately increased.

The redeeming feature to the Canadian hardwood trade was the strong home market. This was caused largely by the activity of the furniture trade and the implement trade. The improvement in the implement trade can be traced directly, in a large measure, to the opening up of Western Canada, and also to the large amount of building and construction work which was carried on in all parts of the country, making a demand for vehicles for carrying materials. The implement trade was very strong, especially for Western Canada demand. The same applied to the furniture trade. The building trade was strong in all parts of the country, both west and east. The building trade caused a considerable increase in the demand for hardwoods, because it has now come to the point that a building is not considered good unless it is finished in hardwood.

One of the features of the Canadian hardwood market during 1910 was the very considerable increase in the price of maple, in practically all thicknesses. The demand developed to such an extent during 1910 that, at any early date, it was found there would not be anything like the quantity of stock in Canada necessary to take care of the trade. As a consequence, maple in practically all the thick lines advanced as much as $5 or $6 per thousand. This advance was maintained throughout the year, for the reason that there was no surplus, in fact, not enough stock in the country to take care of the demand. The enormous demand for maple was reflected in the market for birch, and a large portion of the manufacturers discovered that, for a great many uses, birch is fully as good as maple. The natural result was a tendency to develop the demand and improve the price situation in the birch lines.

The strong trade in furniture and piano lines throughout 1910 kept the supply of elm well cleaned up, and prices were well maintained accordingly, causing, in fact, a considerable advance in these lines. Good basswood was strong throughout the season, particularly where a man had stock which ran well to grade in good widths. Winter-cut basswood was especially sought after. Toward the end of the season the basswood situation appeared to lag, and in a number of cases concessions were apparently offered. In the majority of cases, however, it would be found that these apparent reductions were really caused by the fact that it was inferior stock which was being sold. Basswood is becoming scarce in Canada, and naturally a certain amount of this low end stock has to be produced, which must be sold cheaply.

The market for ash, wherever good ash was available, was strong. In a large portion of Canadian territory the brown ash tree has been killed by some cause or other, and we are getting very little but low-grade stock, but wherever a man could show stock of good width, growing high, and suitable for finishing, he had no trouble in getting handsome prices. The price of ash, owing to its becoming scarcer each year, is advancing very materially, so that good ash is approaching a footing similar to that of good plain oak.

Taking everything into consideration, there is every indication of a good Canadian trade in hardwood during 1911. The United States situation, however, looks to be very much the same as last year, as though it would be spotty, owing to the unsettled political situation. The tendency, until the tariff situation has been disposed of, will probably be for the United States buyer to hold aloof, and this is certain to have a bad effect upon the situation in Canada for some time. On the whole, however, there is little reason to worry over the situation. There is no reason to anticipate any great advance in prices, and unless there is an over-production this year—which is not to be expected—there is no reason why trade should not be fairly good throughout 1911, without any reduction in prices.

Manufacturers of cooperage in Canada have no great reason to look back upon the last two or three years with much satisfaction. Many adverse circumstances have made their influences felt upon trade conditions. Although there has been a fair volume of business, the trade as a whole has been able to make only scanty profits, and the recovery from the general trade depression which was at its height two years ago has been extremely slow. For the following report upon trade in 1910 we are indebted to the Sutherland, Innes Co., Ltd., of Chatham, Ont.:

A Poor Year for Cooperage Business

The year 1910 was not a very profitable one for the cooperage industry in Canada, for two reasons: First, the smaller consumption of No. 1 Canadian stock, and, secondly, the failure of the apple crop.

The unexplainable ruling of the Minister of Customs, which admits unjointed slack barrel staves into Canada free from duty, while the same staves shipped from Canada to the United States have to pay 10% duty, has resulted in the importation of a quantity of cheap gum staves from the Southern States, and while these staves do not compare favorably with elm staves, in fact, are not used even in Minneapolis to any extent for the flour barrel trade, some of the Canadian millers are using them, and hold the price of these staves as a club over the Canadian manufacturers to keep prices down. Gum stumpage is of little value in the South, negro labor is cheap, and consequently these staves can be put into Canada at a price that manufacturers here cannot compete with. Provided the Government of Canada could arrange reciprocity with the U. S. A. on staves, this situation would right itself, but 10% duty one way and no duty the other is a serious handicap against the Canadian manufacturer.

The output of staves, hoops and heading for 1910 showed little change from 1909. About the same amount of staves and heading was made, but there was a falling off in the quantity of hoops manufactured. Prices were lower than in 1909, especially towards the close of the year, the apple crop failure leaving a surplus of No. 2 stock on hand, a great deal of which was disposed of at low prices for the export trade.

While there was quite a considerable import of gum staves into Canada during the year 1910, there were practically no hoops imported from the United States into Canada. There is a 25% import duty on hoops, and it is only when there is a scarcity of hoops in Canada that they can be brought in here. Prices on hoops in the United States are considerably higher this year than for the previous three years, and the demand is fully equal to the supply, so that as the demand was less than usual, no hoops were imported.

The price of elm lumber is now high, and a number of the cooperage manufacturers are turning a considerable portion of their elm into lumber instead of into staves and hoops. There is quite a large demand for elm lumber for export, and as the quality required is a very high grade, hoop logs, or what would make hoop logs, are used for this trade. This has had an appreciable effect on the production of hoops in Canada. There will be more logs turned into lumber than ever this year, instead of into cooperage stock, consequently, unless prices advance considerably, we look for a diminution in the output for 1911.

As near as we can get at the production, the following was the output in Ontario for the year 1910:

Ninety million staves, 24,000,000 hoops, and 4,000,000 sets of heading. These figures are in round numbers, and we think that about 10% added to this would give, approximately, the aggregate amount of cooperage stock produced in Ontario this year. We have no figures of the production in Quebec, New Brunswick or Nova Scotia, as it is impossible to get anything like correct estimates from these three provinces. We do not believe, however, that the production of staves in these provinces, outside of nail keg staves, would exceed 20,000,000, and heading 1,000,000 sets. There are practically no hoops produced outside of Ontario. There are also a few staves being produced in British Columbia now, but the amount is very small. We do not believe there are over 2,000,000 staves produced in British Columbia at the present time, per annum, and not to exceed 150,000 sets of heading.

Lumber Trade of Quebec During 1910

A Slight Increase In Shipments of Sawn Wood Goods—Spruce Deal Trade Also Growing—Total Exports Nearly Two Hundred and Seventy Million Feet

The lumber trade of the province of Quebec during the year 1910 was in many respects satisfactory. So far as the trade with Great Britain was concerned, although much was left to be wished for, the actual results of the year's business were as good as those of the year before. The quantity of lumber shipped to the Old Country showed, in fact, a good increase. Competition from Norway, Sweden and Russia was very strong. As usual, however, the timber trade showed a continuation of the decrease which it has been experiencing for a number of years. The trade with the United States was good, in spite of the uncertain political situation in that country. The political situation bugbear, in fact, has become so regular an accompaniment of trade conditions in that country, that the lumber trade of Quebec has learned to dispense with its influence to a large extent. The exports to the United States for the year, from the consular district of Quebec, showed an increase in value over those of the previous year of almost $280,000. If it had not been for the competition of southern pine, Quebec's trade with the United States would have been satisfactory in every respect.

Pulp and Paper Business Expanding.

During the year a large amount of English and American capital was invested in Quebec and eastern Canada pulp and lumber areas. This will have the effect of increasing the production and of directing the attention of the world's market to this province as a field for meeting the demand. In addition the conservation policy in the United States undoubtedly will tend to make them conserve their own forests and seek their supplies elsewhere.

The pulp and paper business the last year has been conducted on an extensive scale. Owing to Sir Lomer Gouin's policy of prohibiting the export of pulpwood cut on Crown lands, American paper makers came over in large numbers and bought up as much as they could of the available stock of pulpwood. They also arranged to install mills and bought extensive limits for this purpose.

The Canadian Power & Paper Company, a $10,000,000 concern, financed by English capitalists, was organized by Mackenzie and Mann. It will build a 500-ton mill in the spring in the Lake St. John District in northern Quebec.

The Wayakamite Pulp & Paper Company, of Three Rivers, with a $5,000,000 bond authorization, also was incorporated. Of the bonds $3,000,000 have been issued, the rest being held in reserve. This company has acquired the Baptiste limits on the St. Maurice River, and will erect a mill at Three Rivers, capable of producing 100 tons of newspaper a day and employing 1,000 hands.

Price Bros. made a $6,000,000 stock flotation during the year, for the purpose of extending their plants and acquiring additional limits. They took over the Jonquiere Pulp & Paper Company and have arranged to build a 150-ton paper mill at Riviers Aux Sables. The mill will employ 1,500 hands.

The Brompton Pulp & Paper Company made extensive improvements and additions during the year, acquiring the Champoux limits, the Craig limits and the Emberton Lumber Company's limits. It also acquired the Royal Paper Company's plant at East Angus, to which it has made extensive additions and improvements, making it capable of producing 100 tons a day.

During the year the Bayless Pulp & Paper Company had its title confirmed to large timber areas, about twenty-three miles from Quebec. This had been in dispute for some time, which retarded all development work. The Bayless company plans to begin active operations at an early date.

At Murray Bay, the Eastern Canada Pulp Co. decided to erect a 100-ton mechanical pulp mill.

At La Tuque a 400-ton mill is to be erected by the St. Maurice Industrial Co.

Altogether the year will be remembered as one of the most active in connection with the pulp and lumber industry throughout eastern Canada. Mills being erected or being planned in Quebec will increase the daily output by 1,000 tons of newspaper.

Detailed Review of the Year's Trade.

The annual timber circular issued by J. Bell Forsyth & Co., and published by the Quebec Chronicle Printing Co., contains the following summary of the year's trade:

"A diminution alike in supply, export and stocks shows a decreasing trade in timber. There is no increase except in price. Advanced values, while tending to limit demand and consumption, have had no marked effect in increasing production. As against this, shipments of sawn wood goods from Montreal show some slight advance over last year, and spruce deal shipments from the St. Lawrence continue to become greater in quantity. General trade in the United Kingdom shows continued increase, and the past year will probably show record returns for both imports and exports, while the income and wealth of the country appears to have exceeded all former figures. The recent parliamentary elections were remarkable as showing practically no change within the twelve months in public opinion. The business outlook in the United States leaves much to be desired. The alteration in political feeling shown by recent elections there may have ultimate dsirable results, but meantime it unsettles business by introducing uncertainty and threatening impending change in tariff and other matters.

Exports from St. Lawrence Ports.

The Canadian export trade in wood goods from the St. Lawrence ports for the season was as follows:

Shippers.	Montreal.	East of Montreal.	Total Ft. Bd. Meas.
W. & J. Sharples	11,014,202	50,816,842	61,831,044
Dobell, Beckett & Co., Ltd	3,640,841	18,594,450	22,235,291
J. Burstall & Co	10,501,571	8,835,686	19,337,257
The McArthur Export Co., Ltd	....	846,216	846,216
The Harper Wade Export Co	....	885,384	885,384
Price Bros. & Co., Ltd	....	42,347,014	42,347,014
H. R. Goodday & Co	....	18,556,360	18,556,360

Increase 1909	6,439,446	26,187,035	32,626,481

Supply, Export and Stock.

The following comparative statement shows the supply, export and stock of lumber at Quebec to the first of December for 1909 and 1910:

Articles.	Supply Year ending Dec. 1.		Export Year ending Dec. 1.		Stock on Dec. 1.	
Timber—	1909.	1910.	1909.	1910.	1909.	1910.
Oak, cubic. ft.	568,960	256.680	242.837	342,588	698,097	561,725
Elm	108,080	246.920	214.682	259,233	88,663	78,581
Ash	520	1,400	5.390	1,232	607	683
Birch	189.500	129.191	193,652	129,332	141	....
White pine, square	57,520	10,720			29,455	3,472
Do., waney	738.840	541,440	1,038,750	747.353	220.734	64,981
Red pine	8,680	21,920	6,624	6,653	6,262	16,302

The following is an analysis of the stock of lumber in the port of Quebec on Dec. 1, 1910:

Coves.	White Pine. Square.	White Pine. Waney.	Red Pine.	Oak.	Elm.	Ash.	Hickory.
Sillery—W. J. Sharples	....	11,277	....	119,546	15,541	....	....
Upper Sillery—Dobell, Beckett & Co., Ltd	2,356	25.015	10,862	40.541	17,793	....	....

Union Cove—Jas. Timmony	658	27,489	5,440	118.200	42,600	379	876
New Liv. Cove—M. Wade.	....	....	....	62,795	....	....	....
Total	3,472	64,981	16,302	561,725	78,581	683	985

Analysis of Trade Conditions.

White Pine.—The supply of waney pine is much the smallest recorded; that of square pine is approaching the vanishing point. The export, though the lightest in the history of the trade, leaves a wintering stock of not much over one-quarter of the smallest previous one. The production of the present winter seems quite unlikely to give a supply that would permit of a larger export, and consumers of this wood may shortly have to look for a substitute, which possibly Manchuria may supply.

	Supply.	Export.	Stock.
1910, square	10,720	747,353	3,472
1910, waney	541,440		64,981
1909, square	57,520	1,038,750	29,455
1909, waney	738,840		220,734

Red Pine.—The supply and stock show some increase, while the export remains the same. The business in this wood is inconsiderable, as there is no demand for it, pitch pine having taken its place.

	Supply.	Export.	Stock.
1910	21,920	6,653	16,302
1909	8,680	6,624	6,262

Oak.—The supply is much under the excessive one of last year. The production has ceased and the balance remaining to come forward is not large, so that if the export is maintained at figures of past season and does not fall back to those of the one previous to it, two years should serve to clear up the present visible stock. At the same time it must be remembered that average stocks of this wood are held in the United Kingdom, and sawn oak scantlings from the United States, as well as log oak from Mobile and other Southern States ports, are coming forward freely at much lower prices than anything can be shipped for from Quebec.

	Supply.	Export.	Stock.
1910	256,680	342,588	561,725
1909	568,960	242,837	698,097

Elm.—The stock is somewhat reduced, the supply probably ample, and the export well maintained. The present tendency seems to be towards the consumption again overtaking the supply, and whenever that takes place the price will once more advance.

	Supply.	Export.	Stock.
1910	246,920	259,233	78,581
1909	108,080	214,682	88,663

Ash.—This wood has almost gone out of production and does not appear to be wanted. The supply, export and stock are all trifling in quantity.

	Supply.	Export.	Stock.
1910	1,400	1,232	683
1909	520	5,390	607

Birch.—The reduced production consequent on unsatisfactory results for recent years has left the markets of the United Kingdom bare of this wood, but already winter shipments are being made, or shortly will be. Besides Quebec statistics given below, considerable shipments of birch are made each year from Montreal. The sawn birch planks shipped from Montreal and Quebec are additional, and considerable in quantity.

	Supply.	Export.	Stock.
1910	129,191	129,332	....
1909	189,500	193,652	141

Spruce Deals.—It having been increasingly difficult for some time past, and latterly quite impossible to obtain full and reliable particulars of the St. Lawrence ports, export and stock of spruce deals—no attempt to give these for the past season is now made. The statement of exports from the St. Lawrence indicates an increasing shipment, which now has probably reached unprecedented figures in these goods.

Pine Deals.—The business of the port in these is no longer worth recording. The reduced quantity of pine deals produced is shipped from Montreal, but to some considerable extent their place as an export has been taken by pine sidings and boards.

Sawn Lumber.—Good pine sidings and high grade pine lumber have further advanced and are firm at record figures, probably owing to the limited production and consequent scarcity of first quality boards. Shipping culls and medium grades are without much change and quiet, while low grade and common lmuber, though improving, is still most difficult to place.

Freights.—Have remained at about last year's level. For timber from Quebec 50s. has been the general Manchester rate, though for small quantities for late shipment rather more was paid. 55s. was general rate for Greenock and London, with 60s. for Tyne. 55s. was general Liverpool rate, with 50s. or less for short timber. For deals from Montreal 30s. was general liner rate for Liverpool and Glasgow, with 35s. for London. For sidings 5s. additional if under two inches thick.

Statistics of Vessels and Cargoes.

The following statement shows the number of sailing vessels cleared at the port of Quebec, for sea (lumber laden), from 1895 to 1910, from opening to the close of navigation.

The port of Quebec includes the Saguenay and Lower St. Lawrence.

	Vessels.	Tons.		Vessels.	Tons.
1895	86	70,960	1903	53	25,141
1896	145	113,755	1904	46	19,126
1897	147	90,381	1905	46	9,258
1898	121	70,588	1906	52	19,064
1899	80	50,242	1907	36	9,568
1900	99	43,036	1908	29	11,902
1901	69	37,171	1909	25	8,307
1902	93	33,534	1910	22	7,726

The following statement shows the number of steamers cleared during the last five years, with lumber cargoes:

1906	198	steamers,	669,779	tons,	for part	and entire	cargoes.
1907	170	"	578,604	"	"	"	"
1908	165	"	595,878	"	"	"	"
1909	151	"	519,242	"	"	"	"
1910	130	"	610,172	"	"	"	"

The Quebec and Lake St. John Railway carried the following cars of wood products during the year ending 1st November, 1910: Deals and lumber, 3,293 cars; cordwood, 803 cars; square timber, 531 cars.

Decrease in Square and Waney Timber.

Statistics of square timber measured at the office of the Supervisor of Cullers, Quebec, show that the falling off in shipments has continued. The total shipments during 1910 were 24,994 pieces, against 31,865 in 1909. The total in cubic feet was 1,125,360, against 1,544,040 in 1909.

Totals of the timber measured at the Supervisor of Cullers' office during 1910 and 1909 were as follows:

	—1910.—		—1909.	
	No. of Pieces.	Cu. Ft.	No. of Pieces.	Cu. Ft.
Waney white pine	12,031	541,440	13,287	738,840
Square white pine	353	10,720	1,624	37,520
Square red pine	573	21,920	237	37,520
Square oak	4,477	256,680	10,188	568,960
Square elm	5,181	246,920	2,295	108,080
Waney hickory	12	400	17	520
Waney ash	42	1,400	21	520
Waney birch	2,256	44,400	4,195	60,840
Waney whitewood	10	320	1	80
Waney walnut	59	1,160	....	....
Total	24,994	1,125,360	31,865	1,544,040

Quebec Exports to the United States.

The exports of lumber, pulpwood, pulp, etc., from the United States Consular District of Quebec show a substantial increase for the year 1910 as compared with 1909.

The declared exports from the United States Consular District of Quebec for the years 1910 and 1909 were as follows:

March Quarter—	1909.	1910.
Lumber, rough	$1,036 43	$33,185 84
Clapboards	....	2,615 40
Deals	....	3,364 00
Laths	3,901 85	1,048 47
Shingles	....	561 25
Total	$4,938 28	$40,774 96
June Quarter—	1909.	1910.
Lumber, rough	$93,725 28	$230,306 41
Clapboards	....	....
Deals	....	18,777 67
Laths	2,678 06	5,632 63
Shingles	....	4,394 97
Total	$96,403 34	$259,111 68
Sept. Quarter—	1909.	1910.
Lumber, rough	$195,022 76	$253,959 42
Clapboards	2,495 00	....
Deals	21,768 63	26,591 19
Laths	7,065 94	16,066 20
Shingles	....	18,243 47
Total	$226,352 33	$314,860 28
Dec. Quarter—	1909.	1910
Lumber, rough	$256,022 61	$205,836 43
Clapboards	2,250 00	1,450 00
Deals	4,763 44	24,217 86
Laths	5,616 11	14,228 18
Shingles	562 90	15,064 46
Total	$269,215 06	$260,796 93
Total for the year	$596,909 01	$875,543 85

In 1909 the lumber exports from the American Consular Agency District of Levis, Que., amounted in value to about $185,000. This agency was abolished in January, 1910, and its exports, from 1910 on, figure in the returns of the Quebec Consulate, which accounts for a portion of the increase in these exports in 1910 over 1909. Notwithstanding this, however, there was a substantial gain for 1910 in the lumber exports from the whole district, amounting in value to something more than $100,000.

Such increase was only in keeping, however, with the increase in the general exports from this district, which in 1909 amounted in value to $2,941,239, and in 1910 to $4,893,550, or almost two millions dollars more in 1910 than in 1909.

Pulpwood and Wood Pulp Exports.

The greatest part of this increase undoubtedly is due to the increasing exportations of pulpwood and wood pulp, which for the years from 1905 to 1910 from this Consular District were as follows:

	1905.	1906.	1907.	1908.	1909.	1910.
Pulp wood	$281,819	$239,726	$385,941	$636,186	$1,180,029	$1,702,644
Wood pulp	29,704	22,951	209,538	230,362	264,558	765,131

From the Canadian standpoint it must be gratifying to note in this connection the sudden increase of the exports of pulp. Such exports prior to 1907 constituted a negligible quantity. In that year they took an upward course, and have since increased steadily, so that in another year, it may be confidently expected, that these exports from the Quebec district alone will reach the million-dollar mark, and perhaps go beyond it.

THE YEAR'S TRADE IN EASTERN QUEBEC.

The Cascapedia Manufacturing and Trading Company, New Richmond, P.Q., in a letter to The Canada Lumberman refers to the lumber trade of the past year as follows:

"With reference to the lumber situation, the past year has been only a very ordinary one. While the deal market in the United Kingdom has been fairly active, the United States markets, which take quite a large proportion of the lumber produced in this district, were seriously depressed. We are glad to say, however, that the United States markets are again looking better and the prospects for the coming year, we consider, are very much better than they were during the past season.

"In this locality there are a large quantity of cedar shingles produced. These find their market largely in the United States, but the increase in the American tariff on shingles from Canada into the United States has very seriously interfered with the shingle business of the past season. Manufacturers find that it is not profitable at the present time to manufacture shingles for the United States market, as in addition to the extra duty they are now obliged to pay, there is a depression in the shingle market in that country which adds to the difficulties. We think, however, that there are better times right ahead of us now for the shingle industry, and we hope that next season will see a decided improvement.

"We think, that owing to the increase in the stumpage dues imposed by the Quebec Government, which went into effect on September 1 last, the output from this district, both in lumber and shingles, will be considerably curtailed, as compared with what it has been in former years. Until this matter rights itself, the likelihood is that a great many of the lumber producers down here will manufacture a great deal less material than they have in the last few years."

"So far as the low part of the province of Quebec, in the Gaspe District, is concerned, there is practically no pulp wood produced, as there are no pulp mills located down this way on the Quebec side, and there are no facilities for shipping pulp wood to be manufactured at other points. Then, in addition, the Quebec Government have prohibited the exportation of pulp wood from Crown Lands in the province. This is really a pulp district. There are large quantities of good spruce here suitable for pulp. It now looks, however, as if in the very near future we are to have a good-sized pulp plant built in this district. When this is accomplished, it will mean a great deal for this part of the world, giving employment to labor and also a market to the settlers who will have pulp wood to dispose of."

Growth of Canada's Pulpwood Industry

Statistics Show Increase In Production, Consumption and Export—Raw Material Still Going Out of the Country—Valuable Report Compiled

By H. R. MacMillan, M.F.

The most recent statistics available regarding the production and consumption of pulp wood in Canada are those which have just been issued by the Department of the Interior for the year 1909. In connection with the statistics, which are published herewith, the figures for pulp wood consumption refer only to wood manufactured into pulp in Canadian mills. This wood is all of domestic origin. There is no pulpwood imported into Canada. The quantity of pulpwood exported from Canada during 1909 is shown in Table 6. The value given for pulpwood is the value at the mill. There are about ten mills in Canada from which no reports were received for 1909. The fifty mills reporting, used in 1909, 622,129 cords of wood. This is an increase of 139,352 cords, or 28.9 per cent., over the pulpwood consumption for 1908.

Because of its extensive spruce forests, abundant water powers and plentiful supply of labor, Quebec is responsible for over one-half of the total pulpwood consumption of Canada. Quebec mills used 53 per cent. of the pulpwood manufactured in Canada in 1908, and 51.4 per cent. of the total in 1909. The percentages used in the other provinces were from 1908 and 1909, respectively: Ontario, 32.4 and 30.1; New Brunswick, 11.2 and 14.2; Nova Scotia, 3.4 and 4.1 British Columbia manufactured pulp for the first time in 1909, and used then only two-tenths of one per cent. of the total amount of pulpwood consumed in Canada. The mills in British Columbia have not yet been running on full time.

[1] Approximate.
[2] No pulp was manufactured in British Columbia prior to 1909.

Table 1

The average value of pulpwood per cord at the mill was less in 1909 than in 1908. The average for Canada was $6.07 per cord in 1908, and $5.57 in 1909. The decrease was common to all the provinces excepting Quebec, where the price was $5.73 in 1908 and $5.84 in 1909. The greatest decrease was in Ontario. The average price fell $1.51 per cord, from $7.23 in 1908 to $5.72 in 1909.

Pulpwood was cheapest in 1908 in Nova Scotia at $4.07 per cord, and highest in British Columbia at $7.60 per cord. Over the area where 81.5 per cent. of the wood was consumed, Ontario and Quebec, the average price varied only 11 cents per cord, the wood being cheaper by that amount in Ontario than in Quebec.

Pulpwood Consumption by Species.

Two species, spruce and balsam, furnish 99 per cent. of the wood used for pulp in Canada.

The quantity and value of these and the other woods used during 1909 is given in Table 2.

Spruce is the mainstay of the pulp industry. Over 516,000 cords of spruce were manufactured into pulp in Canada during 1909. This was over four-fifths of the total pulpwood consumption, and represented an increase of 22.7 per cent., or 95,399 cords over the domestic spruce consumption for 1908. The increase in the use of balsam was much greater. About one-sixth of the pulpwood used in 1909 was balsam; this was 73.1 per cent. more than was used in 1908. The quantities used of the other three woods, poplar, hemlock and jackpine, are inconsiderable. Poplar is the most important of these; hemlock was used in the soda process in Quebec in 1909, but was not reported for 1908. Jackpine was used in the mechanical process in Quebec in 1908, but its use was not reported for 1909. A small quantity of wood of unspecified species was used in the experimental manufacture of soda pulp in British Columbia.

Kind of Wood.	1908 Quantity.	1908 Value.	1908 Per cent distribution.	1909. Quantity.	1909. Value.	1909. Per cent distribution.
Total	cords. 482,777	$ 2,931,653	100	cords. 622,129	$ 3,464,080	100
Spruce	420,631	2,541,576	87·2	516,030	2,793.318	82·9
Balsam	57,821	369,915	11·9	100,095	637,065	16·1
Poplar	1,575	9,162	3	5,188	30.135	·9
Hemlock[1]	....	....	....	700	3,156	·1
Jackpine[2]	2,750	11,000	·6	....	....	....
Unspecified[3]	....	....	....	116	406	(4)

(1) No hemlock was reported for 1908.
(2) No jackpine was reported for 1909.
(3) Wood used in British Columbia for experimental purposes.
(4) Less than one-tenth of one per cent.

Table 2

The average prices of the different woods used, as they indicate (in some cases where the manufacturing companies own timber limits) the cost of logging and bringing to the mill, and not the purchase price, do not show the relative value of the different woods for pulp manufacture. It would seem, though, that balsam is quite as satisfactory for pulp manufacture as any other species, for both in 1908 and 1909 it represented a higher cost at the mill than any other species. The prices per cord were in 1909: Balsam, $6.26; poplar, $5.81; spruce, $5.41; hemlock, $4.51. These prices are, without exception, lower than those ruling in 1908. The prices paid for the species used in 1908 were: Balsam, $6.39; spruce, $6.04; poplar, $5.82; jackpine, $4.00. The wood showing the greatest change was spruce, the price of which decreased 10 per cent., or 63 cents per cord.

A small quantity of slabs and sawmill waste were used for pulp in 1908, but no such material was reported for 1909. In other countries the use of such material is usual, and seems to give satisfactory results. This economy will probably become general in Canada when the price of pulpwood increases. Immense quantities of slabs, edging and sawdust are wasted yearly.

Pulpwood Consumption by Provinces, Species and Processes.

The extent to which different woods are used in different processes in each province is shown in Table 3.

(1) 116 cords of unspecified wood used for experimental purposes.

Table 3

Three-fifths, or 60.8 per cent., of the pulpwood manufactured in Canada was reduced by mechanical process; the sulphite process accounted for over one-third (37.2 per cent.) of the wood used, and the remainder (2per cent.) was manufactured by the soda process.

Spruce was the chief wood used in each process of manufacture. Over one-half (57.9 per cent.) of the spruce was used for mechanical pulp; two-fifths (40.6 per cent.) was manufactured into sulphite pulp, and the remainder (1.5 per cent.) was manufactured by the soda process. Balsam was used in the mechanical and sulphite processes only, and found greatest favor in the mechanical process. Over four-fifths (81.3 per cent.) of the balsam was used in the mechanical process. Poplar is not adapted for manufacture by the mechanical or grinding process; 98.3 per cent. of the poplar used was manufactured by the chemical processes, 57.8 per cent. in sulphite mills, and 40.5 per cent. in soda mills. The soda process, though expensive, may be successfully used with more varieties of wood than the other processes. The small quantity of hemlock used was manufactured into soda pulp.

Mechanical Processes.

The manufacture of pulp by the mechanical process requires great water power and a long-fibred wood. Quebec, of all the Canadian provinces, best fulfils these conditions, with its many waterfalls and extensive forests of spruce and balsam. Almost two-thirds (62.7 per cent.) of the wood used in the mechanical process is manufactured in Quebec; one-quarter (25.9 per cent.) is manufactured in Ontario; 6.2 per cent. of the mechanical pulp is manufactured in Nova Scotia, and 5.2 per cent. in New Brunswick.

Spruce furnished 79.3 per cent. of the wood used for mechanical pulp, the remainder was balsam. The average cord of wood reduced by the mechanical process in Canada in 1909 produced 1,651 pounds of pulp. This is almost twice as much per cord as is produced by the chemical processes.

Sulphite Process.

Ontario leads in the manufacture of sulphite pulp. Of the 231,422 cords of wood used in the sulphite process in 1909, 37.9 per cent. was used in Ontario, 33.6 per cent. in Quebec, 27.9 per cent. in New Brunswick, and .6 per cent in British Columbia.

Spruce formed 90.6 per cent. of the wood used in the sulphite process, balsam 8.1 per cent., and poplar 1.3 per cent.

The average production of pulp for every cord of wood used in the sulphite process was 914 pounds.

Soda Process.

The soda process is not in general use in Canada. The four provinces manufacturing soda pulp, with the percentage manufactured in each, are: Quebec, 48.6 per cent.; New Brunswick, 39.5 per cent.; Ontario, 10.8, and British Columbia, 1.1 per cent. Spruce, poplar and hemlock were used in the manufacture of soda pulp; of the total, spruce formed 71.2 per cent., poplar 20.7 per cent., hemlock 7 per cent., and wood manufactured as an experiment in British Columbia, 1.1 per cent.

The average pulp production per cord of wood used in the soda process was 961 pounds.

Many of the details of the pulp manufacturing business are presented in Table 4.

One-half the pulp mills of Canada are in Quebec, one-fifth in Ontario, and the remainder in the three provinces of New Brunswick, Nova Scotia and British Columbia. Measured by their average annual consumption of pulpwood, the largest mills are those of Ontario, which used 18,735 cords each in 1909. The average consumption per mill for 1909 in Quebec was 12,797 cords, in New Brunswick 12,636 cords, in Nova Scotia 4,179 cords, and in British Columbia 658 cords. The average pulpwood consumption for Canada was 12,442 cords per mill per year; 73.1 per cent. of the pulp manufactured was mechanical, 25.8 per cent. sulphite, and 1.1 per cent. soda.

Exports.

Canada's foreign trade in wood pulp and pulpwood has consisted entirely of exports. Unfortunately, the tendency has been to export wood in the raw form of pulpwood rather than in the manufactured form of wood pulp. The data in Tables 5 and 6 refer to the calendar years.

According to Table 5, about 63 per cent. of the pulp produced in Canada is exported. The proportion of mechanical pulp exported is comparatively large; 86.1 per cent. of the pulp exported in 1909 was mechanical pulp, whereas only 73.1 per cent. of the pulp manufactured in Canada was mechanically prepared.

The average value per ton of the pulp exported in 1909 was $13.97 for the mechanical and $38.99 for chemical pulp. The average price for all the pulpwood exported was $17.45 per ton. The prices paid to Canadian exporters by the different importing countries were per ton, for chemical pulp: United Kingdom, $40.04; United States, $39.09; other countries, $31.64. For mechanical pulp: United States, $16.09; United Kingdom, $10.26; other countries, $9.98.

Table 4

The pulp exports for 1909 were 40.939 tons greater, or 17 per cent. more than those for 1908. The increase was all in mechanical pulp. There was a decrease of 1,693 tons, or about 4 per cent., in the 1909 shipments of chemical pulp.

Each year the United States takes an increasing proportion of the pulp shipped from Canada. Excepting a slight increase in the export of mechanical pulp to the United Kingdom, the entire increase in the export of pulp for 1909 is due to the United States demand. The United States took 63.8 per cent. of the mechanical pulp and 95.7 per cent. of the chemical pulp exported from Canada in 1909. There was a decrease of 86 per cent. in shipment of chemical pulp to the United Kingdom for 1909. The shipment of all pulp to other countries also showed a decrease as compared with 1909.

During the seven fiscal years, 1902 to 1908 inclusive, the United States imported 776,289 tons of wood pulp from Canada; this was 70.3 per cent. of the total wood-pulp imports of that country for that period.

Kind of Pulp and Countries to which Exported.	1908.			1909.

To United Kingdom	7,519	359,812	18·5	1,049	42,007	2·7
To other countries[1]	842	36,958	2	609	19,270	1·6

[1] Includes in the order of their importance, as shown by exports for fiscal years 1908-09, France, Belgium, Mexico, Japan, China, Argentine and Cuba.

Table 5

The pulp manufacturing industry has developed rapidly during the past decade. The value of the exports of pulp for the fiscal year 1899 was $1,274,376. The value of the exports for the fiscal year 1909 was $4,306,929. This represents an increase in ten years of about 238 per cent. The indications are that the development will be even more rapid in the immediate future.

The exports of pulpwood are relatively larger than those of manufactured pulp. All the pulpwood goes to the United States, where it annually supplies 20 per cent. or more of the quantity yearly consumed.

Table 6 gives a detailed statement of the relative quantities of pulpwood manufactured in Canada and exported.

It is noticeable that more wood is exported than is manufactured at home. The figures for the quantity of wood domestically manufactured are more nearly correct for 1909 than those for 1908. In 1909 three-fifths of the pulpwood cut in Canada was shipped to the United States for manufacture. The consideration received for this 915,633 cords of wood was $5,752,659, or $6.28 per cord. This is an average value at the point of shipment of 71 cents per cord more than was paid by Canadian mills. Nearly all this wood went from Quebec. The average price received was only 45 cents per cord more than was paid by Quebec mills.

The wood exported from Canada was manufactured into 340,615 tons of mechanical pulp and 287,514 tons of chemical pulp. Forest Products Bulletin No. 10, issued by the United States Census Bureau, shows that on the average, in the United States, a cord of wood produces about one ton of mechanical pulp or one-half ton of chemical pulp, and that 37.2 per cent. of the wood imported is manufactured into mechanical pulp, 62.8 per cent. into chemical pulp.

	1908.			1909.		
	Quantity.	Value.	Per cent	Quantity.	Value.	Per cent
	Cords.	$		Cords.	$	
Pulpwood produced in Canada	1,378,186	7,830,450	100	1,537,762	9,216,739	100
Domestically manufactured	482,777	2,931,625	0·35	622,129	3,464,080	40·5
[1] Exported in raw state	895,409	4,898,825	0·65	915,633	5,752,659	59·5

[1] All pulpwood exported since 1902 has gone to United States.

Table 6

As the United States imports much more pulp than its exports, it would necessarily have imported this pulp from Canada, had it not imported the wood. Exporting the wood to the United States brought in $5,752,659. Exporting the pulp which that wood made would have brought, at the average prices paid by the United States importers in 1909, $16,719,418. If the manufacture were completed, and the pulp made into paper in its final form before exporting, the difference would be still greater.

The pulpwood shipped from Canada in 1909 furnished 46.4 per cent. of the raw material used by the 90 pulp mills of New York State, 10.3 per cent. of the raw material manufactured in the 62 pulp mills of New England, Maine, Massachusetts, New Hampshire and Vermont, and 6.1 per cent. of the raw material used by the 16 pulp mills of Pennsylvania. A larger quantity of pulpwood was exported in 1909 than in 1908.

The manufacture of the 915,633 cords of wood exported in 1909 kept 69 of the 251 pulp mills in the United States running at full capacity for the year. If this pulpwood had been reduced to pulp in Canada, it would have supplied for the year 73 pulp mills of the average size of those already in Canada. The greater part of the pulpwood exported was cut in Quebec. If it had been manufactured in Quebec, it would have kept running 71 mills of the same size as those now existing in Quebec.

It was in the early eighties that Canadian pulp and paper began to be shipped abroad, and by 1900 our total exports of pulp alone reached a value of $1,816,016, of which $562,178 went to Great Britain, and $1,193,753 to the United States. In that year we shipped paper to the value of $61,012, of which $2,718 went to Great Britain, and $48,052 to the United States. We also shipped books and printed matter in that year amounting to $138,110, making an aggregate of over $2,000,000.

In 1910 Canadian exports of these products reached the following figures:

1910.	To Great Britain.	To United States.	to all Countries.
Pulp, mechanical	$888,898	$2,577,990	$3,545,751
Pulp, chemical	42,252	1,597,319	1,658,846
Paper and manufacturers of	912,524	1,293,435	3,156,096
Books, etc.	82,137	152,672	247,183
Stationery	......	......	23,380
	$1,925,811	$5,621,416	$8,631,256

In addition to these exports of manufactured goods, Canada exported in 1910, 965,271 cords of pulpwood, valued at $6,076,628, all going to the United States. This shows an increase of over 400 per cent. in ten years. It is a noteworthy evidence of the expanding home demands of the Canadian market that our imports of papers, books and other printed matter also increased from $3,467,354 in 1900 to $18,359,342 in 1910.

Personal News of the Lumber Trade

Samuel Parliament, formerly with M. Brennen & Sons, Hamilton, Ont., has taken charge of the Hadley Lumber Co.'s yards at Chatham, Ont. On December 30, he was presented by the employes of the office and shipping departments of the Hamilton firm with a solid oak secretary.

The firm of Kernohan & Wilson, retail lumber dealers, of London, Ont., has been dissolved, and Mr. Geo. N. Kernohan has formed a new company under the firm name of the Geo. N. Kernohan Lumber Co., Limited. Mr. Kernohan has also bought out the retail business of the Ferguson Lumber Co., of London.

P. S. Dainerd, of Crookston, Minn., will have charge of the erection of the large mill of the Shevlin-Clarke Lumber Company at Fort Frances, Ont., and after the completion of the mill will be its superintendent. Mr. Dainerd has been in the employ of the company at their Crookston and St. Hilaire mills for 14 years.

Mr. H. W. Racey, who until quite recently was general manager of the business in Montmagny district for the firm of Price Bros., Limited, has severed his connections with the Quebec firm and has left for the West. Mr. Racey has been appointed general manager of the Big River Lumber Co., at Big River Mills, Sask., one of the largest concerns in the West.

Mr. Donald Ferguson, manager of the Ferguson Lumber Co., of London, Ont., and Mr. Charles C. Ferguson, assistant manager, who have disposed of their retail lumber business to the Geo. N. Kernohan Lumber Co., Ltd., will open an office at 5 Carling Block, London, and give all their attention to the wholesale lumber business. Mr. Donald Ferguson, as formerly, will be manager, and Mr. C. C. Ferguson, assistant manager. Mr. Ferguson decided upon making this change on account of the increasing nature of the retail business, which kept his time so fully occupied that he could not give all the attention he wished to his other interests.

A meeting of the retail lumber dealers of the city of Montreal was held recently, and a lumber dealers' section of the Retail Merchants' Association of Canada was formed. This was the initial step towards the formation of an association for the province of Quebec, similar to the association which has recently been formed in the province of Ontario. Mr. Wilfrid H. Pauze, 29 Place Guay street, was appointed secretary of the Montreal section, and Mr. J. A. Beaudry was appointed provincial secretary. The organization of the retail lumbermen in Quebec will now be carried out upon the same lines as those which have been followed in Ontario.

Increasing Volume B. C. Lumber Trade

A Fairly Satisfactory Year Reported for 1910, and Encouraging Prospects for 1911—Strong Competition from United States Lumber—The Importance of Immigration

The 1910 lumber trade in British Columbia was, on the whole, only fairly satisfactory. During the early part of the season it was good, and probably would have continued so for the rest of the year, had it not been for the fact that the competition from American mills became very strong, and large quantities of their lumber were dumped into the Canadian markets at prices which the British Columbia mills could not meet. During the last half of the season the American mills were especially active in their shipments into Canada. Their own home trade had been badly disturbed by the election campaign and the uncertainties which it caused, so that they were obliged to look for an outlet in other markets. In all grades, especially in the common and the lower grades, they had large accumulations of stock which had to be moved, even at a sacrifice. It is not at all improbable that their activities in this direction may be continued into the present year. The practical failure of the crops in Alberta also reduced the demand for British Columbia lumber from that province. The outlook for the year 1911 in Alberta, however, is encouraging. The winter wheat never looked better at this time of year than it does at present, and it is expected that there will be a very heavy immigration to both Alberta and Saskatchewan. Stocks of lumber in the retailers' hands in this territory are low, and the manufacturers' stocks are, as a whole, below the average.

In spite of disturbing factors, the volume of trade in British Columbia was greater than it had been in the previous year. Reports from a number of the larger mills indicate also that, on the whole, the profits for the year were better than those of the year 1909. One company reports that its net profits were "more than double those of 1909." A company manufacturing about 24.000.000 feet reports that its profits were "much better than those of 1909." One of the largest companies reports that its profits were "slightly better." Of a large number of reports received, practically all agree that profits were better. Taking the year as a whole, the prices received were about the same as those of 1909. During 1909 they were better for the last half of the season, and during 1910 they were better for the first half. A few reports state that better prices were received, and one company places the improvement at about $2 per thousand all round. Compared with a year ago, the stocks on hand at the beginning of 1911 were lighter. The larger mills, with few exceptions, report this to be the case.

The shingle market for 1910 was badly disorganized. Over-production is blamed. Price cutting followed the accumulation of large stocks, and the cutting off of the market in the United States, by the increase in the duty which went into effect near the end of 1908, compelled manufacturers to place much greater quantities of shingles on the Canadian markets than in former years. Towards the end of 1910, however, the shingle situation improved considerably. The producers acted more in unison and price cutting was largely brought to an end.

Views of a Large B. C. Manufacturer.

The British Columbia situation as seen by a large manufacturer is outlined in the following review by A. D. McRae, vice-president and general manager of the Canadian Western Lumber Co., of Fraser Mills, B. C.:

"The year just ending, I believe, can be looked upon as a fairly satisfactory one by the manufacturers, although we have undoubtedly not received the price for our lumber which the high wages and consequent high cost of production have justified. The big wheat crop of 1909 did all, and more than was expected from it, and there is no denying that Western Canada has had in 1910 the greatest building boom in its history. The question we are all interested in is, 'Will it continue?' "

Mr. McRae continues, from statistics, to show that there will be, on a conservative estimate, 4.400,000 people in the four provinces west of the Great Lakes by 1920. This would be over two and a half times the present population.

Dealing with the production and consumption of lumber, Mr. McRae says:

"It has been a serious question for some years with the lumber manufacturers whether the home markets were sufficient to take care of the output of the mills. Undoubtedly, production was for many years in excess of the demand, but I believe, as the figures will show, this situation is now reversed, although the excess demand is not sufficient to justify manufacturers in increasing their next year's output. No figures are available as to the consumption per capita in our Western Provinces. The official figures of the Forestry Bureau of the United States for 1909 show that 44,585,000,000 feet of lumber was consumed in that year. The census just completed of the Continental United States for 1910 shows a population of 91,972,267, so after making allowance for the increase in population from 1910, we find that the consumption of lumber in the United States is 500 feet per capita, and this takes in every state, the South as well as the North, and includes the many large cities in which, owing to steel, concrete and brick construction, but a very small percentage of lumber is used. It will generally be conceded that the per capita consumption of lumber in Western Canada is greater than any place else, owing to the tremendous rural developments, concrete and brick forming such a very small per cent. of the present construction, and I venture the statement that the per capita consumption in our four Western Provinces is at least 750 feet annually, not including railroad and Government requirements. On the basis of 1.725.000 population, this would give an annual consumption outside of railroad and Government requirements, of 1,295,000,000 feet.

B. C.'s Estimated Output for 1911.

"The following estimate of the output for the combined mills, whose product reaches the Western Provinces, for the year 1910, will be found approximately correct, and the estimate of the output for 1911 is obtained from most reliable sources. Likewise, the statement of stocks on hand at the end of 1909, as well as the stocks on hand at the present time, I believe, will be found reasonably accurate:

	Output 1910 Feet.	Estimated Output 1911. Feet.	Stk. on hand Dec. 31st, 1909. Feet.	Stk. on hand Dec. 31st, 1910. Feet.
Spruce mills ...	100 000.000	115.000.000	40.000.000	25.000.000
Pine mills	175,000.000	225.000,000	140.000.000	90.000.000
Mountain mills .	425.000.000	425.000.000	200.000.000	200,000.000
Coast mills	560,000.000	590,000,000	160,000,000	155.000,000
	1,260,000,000	1,355,000,000	540,000,000	470,000.000

"From the foregoing it will be seen that the estimated output for next season of all mills is 1,355,000,000 feet. The basis of 750 feet per capita gives the home consumption of the four provinces as 1,295,000,000 feet. To this must be added railroad and Government requirements, which are not less than 100.000,000 feet; also the shipments from the coast to east of Lake Superior, which will aggregate at least 50,000,000 feet, as well as the lumber exported from the coast to foreign countries, which averages annually about 90.000,000 feet, making a total demand on the mills of 1,534,000.000 feet, against the probable production of 1,355.000.000 feet, or an excess of demand over supply in round figures of 180,000,000 feet.

"Let us see how this compares with the actual lumber consumed during 1910. From the foregoing statement, it will be seen that the combined output of the mills for 1910 was 1,260.000,000 feet. It will be observed from the statement of stocks that during the year the stocks on hand with the mills have decreased 70.000.000 feet, and from the best information obtainable, it is estimated that the stock on hand at the yards throughout the country is fully 15 per cent. less than last year. It is estimated that in the 1.000 yards in the three provinces, outside of the city of Winnipeg, there is an average stock of 310.000 feet per yard, or a total of 310.000.000 feet. To this must be added the stock with the 27 yards in the city of Winnipeg, reported at 40,000,000 feet, making the total stock on hand in all the yards in the three provinces 350,000,000 feet. As this is only 85 per cent. of the stock in the yards at the end of last year, the decrease in stocks in the country is, therefore, 55.000.000 feet. To these figures must also be added the 65,000,000 feet imported into the Western Provinces during the present year from the United States mills. The total of these figures is 1.450.000,000 feet, representing the demand on the mills for 1910, as against the estimated total demand for next year of 1,535,000,000 feet. In order to account for the increase in demand for 1911 over the actual lumber consumed in 1910, as shown above, it is only necessary to add less than 10 per cent. to this year's actual consumption to bring it above the estimated demand for next year, and it might be maintained, on the basis of population and in harmony with all other lines of trade, that the demand for lumber in 1911 should exceed the requirements of the present year by approximately 20 per cent., which, on the basis of this year's demand, would make the total lumber consumption next year 1,740.000,000 feet, or an excess of 385,000.000 feet over the estimated production. However, the demand for 1910, owing to the light building operations of the two preceding years, was undoubtedly unusually heavy, and, therefore, the 20 per cent. increase, showing a shortage of 385,000,000 feet, is likely to be too great, and it is more than probable that the previous estimate of an excess of demand over supply of 180,000,000 feet in 1911, while conservative, is nearer correct.

Outlook for Spring Trade.

"As the foregoing figures demonstrate, the demand for lumber last year was sufficient not only to take the entire output, but to reduce the stock on hand with the mills 70,000,000 feet, the stock in the country 55,000,000 feet, and in addition consume 65,000,000 feet of American lumber. Without this latter item, the stocks in the yards and at the mills would have been reduced 190,000,000 feet in order to take care of the year's requirements. As it is, the stocks have been reduced 125,000,000 feet this year, and in view of the fact that the combined inventories of the mills at the present time give only 470 000,000 feet, which is far below the average, the stocks are in no position to stand a further drain on them. On account of the light stocks now in the country, and the certainty of a big immigration, the spring requirements must necessarily be large. The stocks on hand with many of the mills are very much broken, and for this reason a very considerable percentage, possibly one-third, of the stock on hand is not available for immediate shipments. Many of the coast mills are about to shut down for repairs, and with the very large local demand which is keeping up this winter, there is no likelihood of a material increase in coast stocks during the next 90 days. The mountain, spruce and pine mills will have no opportunity to improve their present stocks before spring, so that it would seem, with only 470,000,000 feet in stock, not over two-thirds of which, or 315,000,000 feet, is available for spring shipment, and with 1,000 yards, outside of Winnipeg, each requiring at least ten cars as an opening spring order, shipment of which must be under way before March 1st, and adding to this the Winnipeg requirements, railway and Government orders, as well as local demand, there would certainly seem to be no occasion on the part of any manufacturer to be fearful of the future, as there is already sufficient business in sight to take care of more than the output of our mills for the first six months of the coming year.

American Competition.

"While some uneasiness was felt during the latter part of 1910, owing to the importation of American lumber, which aggregated 65,000,000 feet for the year, I believe the manufacturers can consider the worst over, so far as American competition is concerned. In the United States, it is found that the political unrest that has been so strong there for the past four or five years is subsiding, and that conditions throughout the entire country are much improved. The aggregate value of their farm products for 1910 was the greatest in the country's history, and undoubtedly they are on the eve of a general revival of business. The crop failures in the Dakotas and Montana, which had such a depressing effect on the mills in Idaho, Washington and Montana, are not likely to occur again. The increased demand from the railroads is already having its effect on lumber prices with the mills that have been bidding for Canadian business, and with the revival of business in the United States, which is evident in the spring, the American mills will be on a par with Canadian manufacturers, as to price, and will practically withdraw from the Canadian market, as the American, all things being equal, will prefer to sell at home. Even should he again be as strong a competitor in 1911 as he was in 1910, which is very unlikely, there would still be a very material shortage to be made up in order to meet the prospective demand. Besides the delay in American delivery, and the uncertainty as to securing the lumber in time for spring trade, will more than offset any slight difference that may still exist in prices.

"In view of the general situation, which cannot be regarded otherwise than as very favorable, and with the assurance of a big increase in immigration for next year, and also the certainty of ample foreign capital for all building requirements, it would seem that the lumber manufacturers, in common with all the other wholesale interests in the West, can look forward to next year with much confidence.

"The absolute certainty of a very large population in our Prairie Provinces, in a comparatively short space of time, and the consequent increase in the demand for lumber, again presses home to us the ultimate value of our stumpage. Another year has only emphasized the fact that the available timber, so far as this province is concerned, has been grossly overestimated, and that in a very short time, when the limited amount of stumpage available is fully realized, prices will advance accordingly.

Government Statistics of Lumber Production.

An official statement recently issued places the revenue of British Columbia from its timber resources during 1910 at about $2.500.000. This is made up as follows: Timber licenses, $85.875; royalties, $304,614; licenses, $1 940,251; scaling fees, $21,698; Crown grant taxation, $95.712. The timber actually scaled by the Provincial Government in British Columbia during the year 1910, and the revenue obtained therefrom, is reported by the Supervisor of Scalers as follows:

Crown Lands—		
Royalty 428,503 linear feet poles	$ 1,092 15	
Tax 2,067,233 linear feet poles	538 72	
Royalty 21,624.92 cords bolts	5,680 58	
Tax 25,106.63 cords bolts	392 08	
Royalty 64,944,081 feet logs	34,259 29	
Tax 100,460,500 feet logs	21,001 72	
Tax 39,560 feet ties	395 85	
		$63,360 39
Leaseholds—		
Royalty 15,491.49 cords bolts	$ 3,622 08	
Royalty 112,895,056 feet logs	56,429 05	
		60,051 13
Licence—		
Royalty 485,959,642 feet logs	$245,662 67	
Royalty 51,075.3 cords bolts	14,680 16	
Royalty 2,713,586 feet lin. poles	7,607 48	
Royalty 223,630 feet ties	2,236 30	
		270,186 61
Making a total of		$393,598 13

In addition to the above amount, there would be about 125,000,000 feet cut on Crown lands and other lands which have not been scaled by the Provincial Government. The cut of the year 1910 was very much in excess of any previous year, and, according to the report of the Supervisor of Scalers, the indications are that the cut for the coming year will be equal, and perhaps more, than it was during 1910.

Official Detais lof B. C. Trade During 1910.

Official statistics have just been published by the Mountain Lumber Manufacturers' Association of British Columbia, giving details of the manufacture, shipment and stock of lumber in the mountain district for the year 1910 and the three previous years, and of all the western mills for the year 1910. The figures show a total output for the mountain mills of 427,822.304 feet, against 329,646,898 feet in 1909. The production of all the western mills in 1910 was 1,332,000,000 feet. Shipments during the year 1910 by all western mills amounted to 1,326,000,000 feet. Details of the production, etc., are as follows:

B. C. Mountain Mills—	1907.	1908.	1909.	1910.
Manufactured ft.	321,273,184	201,746,501	329,646 898	427,822,304
Shipments	209,690,700	167,699,823	324,829,326	376,879.471
Aggregate mountain stock, 1st January, 1910 ft.				182,560,983
Aggregate mountain stock, 1st January, 1911				233,603,674

All Western Mills—	Production, 1910.	Stocks, Jan. 1, 1911.
Coast manufacturers ft.	605,000,000	174,000,000
Mountain manufacturers	427,000,000	233,000,000
Pine manufacturers	175,000,000	90,000,000
Spruce manufacturers	125,000,000	32,000,000
	1,332,000,000	529,000,000

Shipments, 1910—		
Coast manufacturers—Rail trade ft.	284,000,000	
Local B. C.	250,000,000	
Foreign	70,000,000	
		604,000,000
Mountain manufacturers		377,000,000
Pine manufacturers (including burned lumber)		200,000,000
Spruce manufacturers		145,000,000
		1,326,000,000
American importations during 1910 into the four Western Canadian Provinces		112,000,000

Kootenay Lumber Trade Unsatisfactory.

Mr. Peter Lund, managing director of the Crow's Nest Pass Lumber Co., in an able review of the lumber situation in the Kootenay district of British Columbia, says:

"The business during the past year can scarcely be considered satisfactory. At the beginning of the year there was an apparent demand for all the timber and lumber products that were then in the hands of the manufacturers, and a very satisfactory business continued until about July 1st, when, owing to the excessive drought in the Prairie Provinces of Canada, and the unsatisfactory conditions existing among the American mills, which forced large quantities of foreign lumber into our markets, a decided change took place in the general conditions affecting the British Columbia manufacturers. Prices fell to a point considerably below the actual cost of production, and, owing to the arrangements made by the majority of the mills for a large output, there has been, in my opinion, over 100,000,000 feet of lumber sold during the present year, at a price below the actual cost.

"It is quite difficult to judge as to the future, excepting that with a normal demand in our Prairie Provinces, and a good export and local trade on the coast, all the lumber that is now in existence in British Columbia should be absorbed during the next nine months. It would, of course, be folly to expect to run the mills night and day during 1911, and expect to dispose of the lumber that is now on hand and also that which would be cut during that year, as the population that the British Columbia mills have to serve, in competition with the spruce mills in Northern Alberta, Saskatchewan, Manitoba and the western pine mills of Ontario, and our American competition, is too small at the present time to enable the British Columbia mills to run full capacity more than four or five months in the year."

Mr. Lund continues with a discussion of the causes of the unprofitable manufacturing of lumber in British Columbia, which he sums up under the following heads:

1st. The inadequate and unstable market.

2nd. A steady and continual increase in the cost of production.

3rd. The rough and mountainous condition of the country.

4th. The large percentage of small timber growing in the mountain districts and the accumulation of a surplus of low-grade lumber.

5th. The comparatively small stand of merchantable timber per acre in the interior of British Columbia.

6th. The continual annual destruction of the most accessible timber by bush fires.

7th. The high carrying charge in the matter of ground rentals, royalties, etc.

8th. Lack of adequate car service and transportation facilities.

9th. Lack of adequate protection against foreign competition.

10th. The heavy investments of capital required in the business.

"It is a fact that the lumber manufacturer who owns a large quantity of standing timber will show greater profits in holding it and safeguarding its growth and perpetuity from destruction by fire and other causes.

Forest Fires in B. C. During 1910

Effective Preventive Measures taken by the Fire Ranging Service—Review of the Year's Experience

From a handful of fire wardens to patrol a few dangerous points in the the province, a few years ago, to a well-organized force of fire wardens, with laws governing the bush fire problem, and a supply of funds of $200,000 to carry on the protection of the forests of British Columbia from destruction by fire—this is an epitome of recent progress in the saving of British Columbia timber.

British Columbia has passed through another season, which was one of the driest, and most dangerous from fires, that has been experienced in the history of the province. The danger from fires increases greatly each year, from two causes: First, from greatly expanding lumber industries, and second, from the increasing population, which is fast settling the agricultural lands in the valleys of the province, and will continue to increase as each year passes. In view of this, the policy of the government is to maintain and improve the present system of protecting the forests of the province, by an adequate patrol, and by laws that will regulate the disposal of refuse, and also by amendments to the Act, that will control the causes of fire. The government are fully awake to the great necessity for protecting and preserving this great asset of the province by every possible means in their power.

The organization of the force of fire wardens for the province is as follows: The system is under control of the Chief Commissioner of Lands Department, the province being divided into divisions, under the supervision of divisional fire wardens. The divisions are divided into districts, each district in charge of a district fire warden. The whole province is under the supervision of a chief firewarden. These men numbered 76, all paid by the province. These, moreover, were assisted by 262 assistant fire wardens, composed of the government road superintendents and foremen of crews. These men, with their crews, comprised a large force, well equipped to control fires.

An idea of the value of the force is obtained from the fact that during the year, 1.184 fires were reported.

Of these, 615 were handled and extinguished by the wardens themselves without help; 502 fires they controlled by having crews of men to fight. The crews prevented the fires from doing damage to property in close vicinity; 67 fires got temporarily beyond control, and did serious damage before extinguished; 8.663 men were employed and paid by the government to combat the fires.

Standing timber, manufactured lumber and property at large, protected by the work of these men, is estimated at $15,175.500. The estimated damage and loss by fires was as follows: Standing timber, $193,976; cut timber, $63,974; improvements, $371,965; total, $629,915. Many fires could be prevented if those who make use of fire would be more careful.

The following descriptions are of three fires which did much damage. They arose from three different causes, which could have been avoided by care on the part of those who were responsible:

The Rice Lake fire started about noon on Sunday, July 10th. It was caused by campers, and spread very rapidly up a mountain side, into slashing that had been logged through. A large crew of men from the camp in the vicinity was put to work cutting a fire break to keep it from going up the valley and destroying the timber in the valley, and on the mountain side which protected the water supply of the cities of Vancouver and North Vancouver. The wind changed, blowing the fire through old cuttings, down the valley, endangering the village of Lynn Valley. Two hundred men were engaged controlling the fire for days, and they finally succeeded in protecting over $2,000,000 worth of timber and property.

This fire cost the government $1,620 in wages, and the lumber companies lost a large amount. It destroyed nearly $10,000 worth of timber and improvements, and endangered many lives. This was entirely the result of carelessness on the part of persons who, out for a good time, failed to extinguish their camp fires completely before leaving.

What was known as the Marysville fire broke out in three places on July 29th. Railroad locomotives were the cause. Government road men tried to control the fires, and succeeded in extinguishing two. The third, however, got beyond their control. The crews of lumber companies, some 400 men altogether, fought the flames. Fire guards were cut over 12 miles long, to head the fire off. The fight lasted for 12 days. Fifteen million feet of cut logs, several logging camps, many miles of timber land and a number of towns were successfully protected. The fire burned over some 10.000 acres of ground before being controlled, damaging and destroying some millions of timber, costing the lumber companies and the government over $6.000 to control it. The direct cause of the fire was that the railway locomotives had inefficient screens, and the company had no patrol to follow up trains, and extinguish fires started by their locomotives.

The Winlaw fire was caused by a settler clearing land, and not keeping an adequate watch and control on a fire which was smouldering on his property. A strong wind on July 13th carried the fire beyond control. The fire warden had to fight the flames at five different points, where they were endangering large stands of timber, estimated at four hundred million feet. He was finally successful in protecting this valuable stand. Eighty men were employed, costing the government $3.099. The Winlaw fire burned over 7,000 acres of land, of which 2.000 acres was timber land. This goes to prove clearly the extreme danger of not guarding and watching any fire that may be set out for clearing purposes. and indicates the proportions which a fire will assume if once beyond control.

While on the subject of forest fires, it is interesting to note the report which was made by the committee on forest fire legislation, which was presented at the recent Dominion Forestry Convention in Quebec. The report opened with an analysis of the laws existing in each province, showing that they include a great variety of method.

It was pointed out that, while the objects and main features or principles might be made more alike, the methods of application must vary with different conditions. The forest fire law of Nova Scotia was declared the best and most efficient, designed for a well settled country, but would only partially be applicable in other provinces.

The essentials of proper fire legislation were discussed in detail, and it was pointed out that proper organization of a protective service was more essential than legislation: that the legislation should not be specific, but allow wide latitude in making rules and devising methods, to the head of the fire service, who, with all his assistants, inspectors and fire wardens—a permanent organization—should be made responsible for the safety of the districts in which the country should be subdivided.

The construction of watch towers equipped with necessary apparatus, the building of trails and telephone lines, while not inexpensive, are essential to complete success, and a supreme effort should be made, even if expensive, to stop the evil. To discover fires rapidly and prevent their spread to unmanageable extent would be secured thereby.

A main need is to change the attitude of the people at large. Hence, an educational campaign by the fire service organization should go on at the same time with their exercise of police functions.

The burning of brush and "downing" of tops by lumbermen, not under a general prescription, but by rule in each particular case, is advocated.

The possibility of oil-burning locomotives is hinted at. The making of broad fire safety strips is condemned, and instead a forest covered strip, to exclude sun and wind, cleaned of easily inflammable material, is substituted. A regular bicycle fire patrol to follow each train is suggested, and it is pointed out that since the danger of fires spreading is confined to the hours of 9 a. m. to 5 p. m., the expense could probably be kept quite low. The inefficiency of spark arresters and ashpans is explained.

The report concludes with the statement of belief that the people are ready for a supreme effort to get rid of the fire evil, which threatens to wipe out a large portion of the natural resour Dominion, not only in timber, but in soil, thousands of of which are now turned into barrens.

Surveying and Mapping Timber Limits

How a large Manufacturing Company takes Stock of its Forest Resources—An Important Innovation in Economic Management of Logging Operations—

By Fred Cook

The two Head Cruisers

Attention was recently called by the Canada Lumberman to the new departure made by Price Bros., Ltd., of Quebec, in insuring their timber limits against fire. Apart from the success of the flotation of the company's bonds in England, Canada and the United States, nothing has caused more discussion among lumbermen in recent years than this innovation. How can the values of limits be arrived at? How would Lloyd's adjust losses on the insured property in the case of fire?

The system of surveying and mapping of limits has of late been brought to such perfection that in a few years its application will probably have become general. An excellent illustration of how the work is done is offered by the case of the Riordon Company's operations:

In July, 1909, the Riordon Paper Mills, Ltd., of Montreal, engaged Mr. C. A. Lyford, a forest engineer, to make a forest survey of their limits on the Rouge River. The limits lie on the west side of the Rouge River, a tributary joining the Ottawa, about sixty miles above Montreal. The area to be surveyed extended to the head waters of the Rouge, about ninety miles directly north of the mills at Hawkesbury. Approximately, 1,175 square miles were to be surveyed. This included some timber land not controlled by the Riordon Paper Mills, Limited, but in limits adjoining theirs, and tributary to the Rouge.

As appears to be the case with many large limit-holding companies, the Riordon Paper Mills, Ltd., had no reliable maps of their holdings. Even the government township maps proved to be incomplete and inaccurate, and the plans of limits outside the township surveys showed nothing accurately but the data along such limit lines as had been run. There was a large amount of information at hand as to areas of cut-over lands and areas still uncut, and the approximate gross area of the limits was known. Less was known as to areas of water surfaces, burns, windfalls, etc., and there was no inventory of the stock of raw material, nor accurate information as to its distribution and accessibility. Whatever was known in detail, however, was not in available form, but was recorded only in the minds of employes, and hence was of little use to their successors or the company. It was not surprising, therefore, that the need of a forest survey came to be felt.

Objects of the Survey.

In making the survey it was decided to collect complete data, including topography, forest conditions, and all other information that would be of use to the company. The maps were to be so designed that they could easily be kept up to date by plotting annually the new features that would naturally appear in the course of subsequent logging operations. The estimate also was to he compiled and arranged with the view of recording in detail all changes in the amount of wood. Accordingly, in the latter part of July, 1908, work was begun by Mr. Lyford on the uppermost limits, with a crew of eight men, besides a cook and two packers.

The main watercourses were first traversed by canoe. From the data thus gathered, a skeleton map was made, showing the limit lines and the larger streams, with connecting chains of lakes. The remainder of the summer and fall was spent in running a series of base lines with staff compass and chain, numbered stakes being set at intervals of twenty-five chains. Early in December the new ice and snow making conditions unfavorable for cruising, work was discontinued till the first of the year. During this interval a main camp was established on Lake Maison Pierre, about sixteen miles from the nearest winter road.

January, 1909, work was resumed at the camp on Lake party of four cruising crews of two men each. This camp consisted of a small log cabin with a tent roof. The cooking was done in a ten by twelve canvas tent. Two side trips were required to cover the more distant areas. These side trips, camping in small tents and cooking over an open fire, were attended with considerable discomfort, and the cruisers were always glad to return to the comparative luxury of the main camp, where they could at least wash occasionally without danger of freezing. In the course of the winter one of the company's logging camps was used as headquarters, and one more side trip was necessary. The last stage of the winter's work was done from the cabin of a fishing club, where the quarters were commodious enough, so that work could be started on the maps and estimates. At this time a complete set of instructions was drawn up and copied into a field notebook by each cruiser. This proved of great value in attaining uniformity in the arrangement and detail of the field notes.

Method of Cruising Adopted.

The cruising was done by crews of two men each. The assistant cruiser ran the hand compass and assisted in taking sample plots. The cruiser took all notes. The cruise lines were run between corresponding stakes on the base lines, and were paced by the cruiser, who, by continually working over known distances, soon standardized his pace. Knowing the length of the cruise line and the total number of paces, the average length of pace for each line could readily be calculated. All streams crossed by cruise lines were located for several chains on both sides of the lines. All water surfaces below a certain size were plotted on the topography page. Larger ponds and lakes were plotted on a separate page, on a scale of forty chains to an inch. Lakes and streams which had been mapped by canoe were checked with staff compass and chain on the ice, all inlets, outlets and portages being located. All changes in slope of cruise lines were recorded. The general slope of the country was given to the nearest quarter. The boundaries of all burns, windfalls, cuts, scrub areas, swamps, etc., were located for several chains on both sides of the lines.

The composition of the stands and amount of wood in the different timber types through which the cruise lines passed, were denoted by a set of symbols, which indicated the stand per acre and average size of the merchantable trees. On the upper limits, paper birch comprised practically all of the hardwood, the merchantable timber consisting almost entirely of spruce and balsam fir, cedar, however, occurring in considerable quantities in several places. All white pine trees within three chains on either side of the cruise lines were tallied separately. All thrifty conifers less than 4½ inches diameter, breast high, i. e., diameter 4½ feet above ground, were classed as reproduction and noted by an arrangement of symbols similar to that used for the larger trees, the species, number of trees per acre and average size being noted. Sample plots were taken in all merchantable types at intervals along the cruise lines, their number and location being determined by the variation in the types. The sample plot was taken in the form of a circular half acre, the radius of which is approximately 83¼ feet. Its diameter, 166½ feet, was measured along the cruise line with an 83¼-foot cord. The cruiser stood in the centre of the circle and tallied all the trees in the plot as they were measured by the assistant cruiser. The foregoing will serve to give some conception of the methods employed in making a forest survey.

Varying Conditions Met With.

When the spring break-up came the first week in April, 250 square miles had been covered. Headquarters were now established at L'Annonciation, where a rough draughting room was fitted up in one of the hotels. Work in the field was carried on by a party of seven crews, and by the 10th of December following a total of 1,060 square miles had been cruised. On the lower limits in the townships which had been surveyed for settlement by the government, new conditions were met with. The surface of the country was rough, in marked contrast to the generally rolling nature of the low hills on the west side of the Upper Rouge. Here, too, the forest area was broken by numerous cleared farms and much burn and slash. The character of the timber also changed considerably as the work was carried further south. Merchantable hardwoods, such as yellow birch and basswood, appeared in the stands, also hemlock and more cedar. Space was allotted to these in the type columns, and all new conditions recorded in the notes. The range lines, generally a mile apart, were used as base lines wherever they could be found, and alternate lot lines were run as cruise lines, the lot stakes being slightly over 13 chains apart. This gave the cruisers opportunity to observe the conditions on each settled lot, and to note the apparent status of he occupant. Ownership conditions, wherever the settler and limit holder come in contact, are always a bone of contention. Hence, it was decided to make reports on all lots as they were cruised.

Extension of the Original Area.

In the meantime plans had been made for combining the Riordon Paper Mills, Ltd., and G. H. Perley & Co., the new company to be called the Riordon Paper Co., Ltd. This enlarged the area to be surveyed by about 680 square miles, all of which lay adjacent to the Riordon limits on the east. A party of one cruiser, with an assistant and two packers, was sent out in the fall of 1909 to make an exploratory survey of the Perley limits, gathering data for rough field maps, to be used as a basis for planning the winter's cruising.

In October, 1909, the office force took up quarters in the office building of the wood department, at St. Jovite Station, and one of the cruisers was put in charge of making the maps and working up the estimates. This position of office chief was held by Mr. S. L. de Carteret, who left the Riordon Paper Co., Ltd., in July, 1910, to take charge of a forest survey for the Quebec and St. Maurice Industrial Co., Ltd., at La Tuque, P. Q.

During the first three months of last year, with a base line crew and two parties of four cruising crews each, the field work was finished, except for an area of about 350 square miles, which will be covered this winter. The summer was devoted to working up the estimate and making the maps, no field work being done except in the way of revision, i. e., mapping the boundaries of the 1909 cuts, etc. In May, 1910, Mr. C. A. Lyford resigned his position with the Riordon Paper Co., Ltd., being retained, however, as consulting forest engineer, and went into partnership with Judson F. Clark, formerly forester for Ontario, opening an office in Vancouver, B. C., under the firm name of Clark & Lyford, Forest Engineers. Mr. P. L. Lyford, a brother of C. A. Lyford, thereupon assumed charge of the work.

Valuable Maps Prepared.

The maps in their final form are one of the most important results of this forest survey. They are on a scale of four inches to a mile. An index map of the same size as one of the final sheets is provided on a scale of one-half inch to a mile. This shows the whole area included in the survey, with the drainage, limit lines, township lines, and range lines, and the division of the whole into sections of six by twelve miles, each section comprising a final sheet, identified by a number. Thus a glance at the index map will show just what area can be found on any particular final sheet. Watershed lines and block boundaries are also shown on the index map. Outside the townships, the limits are divided into blocks whose boundaries are natural features, such as watercourses or watershed lines and permanent survey lines, each block being considered as a unit in working up the estimate. In the townships a portion or whole of a township serves as a block.

On the final sheets the drainage is shown complete. Lakes above a certain size, or already having names, are given names on the maps. Smaller lakes and ponds are numbered according to a simple system. All driveable streams are shown with a double line. All improvements, such as dams, side piers, chutes, etc., are shown by conventional symbols. Rapids are indicated either by the contour crossings on the streams or by a special symbol. Twenty-foot contour lines give a clear conception of the lay of the land, each hundred-foot contour line being drawn in heavier than the others, and numbered, as is customary on topographical maps. Five timber types are shown on the maps in color—C, CH, HC, H and Scr.

C=over ninety per cent. of the stand conifers.

Mr. Lyford (wearing hat) and his party

Cruisers starting for summer's work

CH=mixture of conifers and broad-leaved or hardwood trees, fifty to ninety per cent. of the stand being conifers.

HC=mixture of hardwood and conifers, fifty to ninety per cent. of the stand being hardwoods.

H=over ninety per cent. hardwoods.

Scr=scrub conifers.

Cleared land is left blank. This gives no conception of the quality of the stands, only the general composition being indicated. The quality and quantity factors of the stands are obtained in detail from the sample plots and field notes. Burns, windfalls and cuts are shown by a system of cross-hatching in three colors, one for each condition, the amount of timber left standing being indicated by the spacing of the lines, and the condition of the reproduction by a set of symbols enclosed in a small circle. Roads, winter roads, bridges, portages, trails, swamps, meadows, old and new logging camps, railroads, railroad stations, etc., are all shown by conventional symbols, which appear on the legend sheet.

Maps of the whole of the company's limits will be completed by the fall of 1911. The estimate will also be complete and all the information collected during the past three years will be in such shape that all or any part of it can readily be obtained when required. All this information will be kept up to date by the Forester and his staff, a permanent department of the company.

Results Secured by Forest Survey.

In conclusion it may be well to set forth, in brief, the results to be expected from the forest survey. They are:

1. A more effective general plan of operation.
2. A reliable valuation of the property.
3. The best possible location of roads, camps and other improvements.
4. A reduction in loss from windfalls, insect damage and normal decay. The felling areas can readily be adjusted with reference to the need of promptly cutting damaged or over-mature timber.
5. The preservation of all knowledge relating to the property. Without a survey system much of this knowledge passes away with those who happen to possess it.
6. A great reduction in possible heavy losses incident to a change in management. An adequate survey system provides a new manager with a mass of essential knowledge thoroughly digested, which he would otherwise be years in accumulating.
7. An increase in efficiency of any system of fire protection.
8. The gradual accumulation of an amount of data sufficient to serve as a reliable basis for estimating future possibilities.
9. The development of a corps of young men, superior in training and ability, who will gradually become competent to take a most effective part in the management of the property.

The new regulations which the Ontario Government is putting into effect for the improvement of the fire ranging force will apply solely to the service in the Provincial Forest Reserves. The fire rangers on timber limits which are under license are selected by the owners of the licenses, and paid by them, although the actual appointment is made by the government, which also appoints supervising rangers. The decision of the government to make the fire ranging in the reserves efficient will be generally approved. In no other case is there more urgent necessity for protecting the natural resources of the country, and the old system, which made it possible for amateur rangers to secure a pleasant holiday at the expense of the government was more or less of a laughing stock with the public.

Among the new bills to be submitted by the Government to the British Columbia Legislature is one for the inspection of logging and railway construction camps.

Lumber Trade of Maritime Provinces

Unsatisfactory Markets for Spruce Exporters During 1910—N.B. Shipments of Lumber Increased Only Slightly—Nova Scotia ExperiencedAverage Year's Trade

During the year 1910 a number of causes contributed to make the English market for spruce an unsatisfactory one from the point of view of the shippers in New Brunswick. Political disturbances in the Old Country, which lasted pretty well throughout the year, interfered greatly with general commercial conditions, and were reflected directly in the markets, especially that for lumber. Trade disturbances also were numerous, notable among them being the shipbuilders' strike, which, for a time, caused a serious stoppage in the consumption of lumber. In spite of all this, however, the shipments from the port of St. John were slightly in excess of those for 1909. An interesting feature of the year's trade was the fact that Liverpool had to take third place in the list of ports to which most of the St. John lumber is shipped. Mancheser came first, and was closely followed by London. The total amount of lumber shipped from St. John during 1910 was 145,564,036 feet, which was shipped in 173 vessels. In 1909 the total was 144,931,454 feet, in 174 vessels. Of the St. John shippers. W. M. MacKay was the only one who increased his shipments during the year, as compared with those of the year previous. The first place in the list, however, is still held by John E. Moore & Co., Ltd., with 46,678,658 feet. Following is a list of the shipments, with those of 1909, 1908 and 1907:

	Sup. ft.	Sup. ft.	Sup. ft.	Sup. ft.
John E. Moore & Co., Ltd...	70,294,047	43,727,541	48,182,020	46,678,658
W. M. MacKay............	75,017,207	40,060,416	42,548,238	46,501,944
George McKean	24,822,944	15,970,059	26,662,679	23,097,386
Alex. Gibson Co..........	29,915,822	25,173,212	20,238,517	19,738,343
Others	7,004,612	10,677,743	7,300,000	9,547,705
	207,054,632	135,608,971	144,931,454	145,564,036

During the year 1910, shipments of birch timber from St. John amounted to 852 tons, compared with 3,293 tons in 1909, 2,249 tons in 1908, 2820 tons in 1907 and 4,507 tons in 1906.

A Slight Increase in Shipments.

The shipments from the New Brunswick ports during 1910, 1909, 1908 and 1907 were as follows:

	1907. Sup. ft.	1908. Sup. ft.	1909. Sup. ft.	1910. Sup. ft.
St. John	207,054,632	135,508,971	144,445,196	146,564,036
Campbellton	17,592,977	35,583,102	32,737,124	31,089,040
Dalhousie...............	17,500,000	15,000,000	19,500,000	24,000,000
Bathurst	10,787,900	10,087,319	13,937,000	10,934,024
Chatham.................	35,931,982	50,698,668	48,375,296	55,259,922
Newcastle	36,436,115	24,917,440	23,913,871	23,750,322
Richibucto..............	1,623,549	2,455,120	3,899,290	3,226,585
Buctouche	1,254,750	463,288	908,730	385,601
Sackville Outports	3,722,652	11,683,896	14,029,204	10,191,619
Shediac	....	2,094,000	3,305,589	5,044,827
Hopewell Cape	19,072,568	7,224,504	....	....
Riverside	3,688,082	10,728,448	20,162,033	17,073,445
Totals	354,665,207	306,445,756	325,213,333	327,519,421

The principal increases, it will be seen, were at Dalhousie, Chatham and Shediac; the principal decreases at Bathurst, outports of Sackville, and Riverside. Some of the cargoes from Campbellton were sent to South America and several to Australia.

Compared with four previous years, the total shipments for last year were as follows:

	No. of Vessels.	Tons.	Deals, etc. Sup. ft.
1906..................	379	754,274	420,182,246
1907..................	312	722,157	354,665,207
1908..................	296	720,904	306,445,756
1909..................	339	822,272	325,213,333
1910..................	334	847,845	327,519,421

St. John River Operations.

The lumbering operations on the St. John River are well indicated by the report of the St. John River Log Driving Co. During the season of 1910 the company drove and rafted 82,327,729 superficial feet. This is a decrease of about 18,000,000 from the average quantity, which for the past few years has been about 100,000,000 superficial feet. The amount of lumber stranded on the river is estimated to be at least 35,000,000 feet. The lumber cut on Crown lands in the province during the past season amounted to about 280,000,000 feet.

The cut of lumber in Northern Maine, on the St. John and Allegash Rivers, is a subject of much interest to New Brunswick lumbermen. Present indications are that there will be a reduction of from 40 to 50 per cent. in the cut in this district. This falling off is attributed to the unsettled condition of the lumber trade, while the large amount of logs hung up from last year and the closing up of the Cushing concern at St. John, also had their effect, that company having been one of the heaviest operators. The entire cut on the St. John and Allegash Rivers in Maine will be less than 50,000,000 feet this year, while in an average season there are nearer 100,000,000 feet taken out. The amount of logs that will go from Maine down the St. John into the booms next spring in the drives will also show a big falling off, the Stetson-Cutler Co., which has its mill at St. John, planning to send down only about half as much as last year, and 15,000,000 feet will cover their logs from Maine waters.

The St. John Lumber Co. at Van Buren is one of the largest lumber harvesters in that section, but that company has cut down considerably, taking out but about 20,000,000 feet instead of its usual 40,000,000 or more.

Conditions were unusual in the woods last fall. In Northern Aroostook County there was very little water. The dry condition in the forests had its benefits, however, and favored the yarding of logs.

The report of the Auditor-General of New Brunswick shows that the province had a very large revenue last year. The total from all sources was $1,847,988. The ordinary revenue is $1,324,440. The territorial revenue, chiefly from timber on Crown lands, was $494,491, compared with $321,000 last year. During the year the stumpage paid on lumber cut on Crown lands amounted to $320,360, compared with $246,724 in the previous year. This creditable showing was in spite of the fact that the prices for lumber throughout the year were far from being satisfactory.

Reduced Exports to United States.

The value of shipments of lumber to the United States from New Brunswick during the years 1908 and 1909 is given by the American Consul at St. John as follows:

From Canadian Logs—	1909.	1910.
Boxwood	$ 500 00	$ 325 00
Kiln wood	1,333 00	1,820 00
Laths...................	336,933 52	348,768 77
Lumber	376,777 21	339,531 50
Piling..................	5,410 08	....
Pulp wood	116,932 25	75,318 02
Shingles................	53,726 49	15,303 81
Ship knees	2,055 75	....
Spruce unmanufactured	2,000 00	....
Staves	987 87	554 40
Railroad ties	....	356 25
Fire wood	....	1,461 00
Wood pulp	....	385,413 58
Total Canadian	$1,671,194 69	$1,168,852 33
From American Logs—		
Laths	$147,107 23	$ 67,482 15
Lumber..................	833,405 14	477,865 07
Shingles	80,162 81	60,115 07
Shooks..................	136 00	....
Total American	$1,060,811 18	$ 605,462 29
Total Canadian	1,671,194 69	1,168,852 33
Decrease in 1910.........		$957,691 25

Extravagant Cutting on Private Lands

Editor Canada Lumberman:

The output of lumber in New Brunswick during 1910, compared with that of 1909, has been about the same, except that the British market has been somewhat better this year than last, and the American market has been just the reverse.

There is one very bad feature in the lumber business, the effect of which is not being felt at present, perhaps, but I am afraid it will cause serious injury to the country at large in years to come. I refer to the policy adopted by people who are not in the business, who own their land, and are selling their stumpage to the highest bidder. These people sell the stumpage without limiting the purchaser to any size of trees he is to cut. I know of several very nice pieces of standing timber that have been sold in this district lately, from which only a few years ago the large trees were cut, leaving a very nice growth of small trees. The late purchaser bought the right to cut down at the stump what would make a 2 x 3 inch scantling. The reason given for selling in this way is that they get big prices, but the man who buys makes little or nothing, and in many instances loses heavily. This is not confined to this district alone, but is going on all over the province, and also in Nova Scotia. Time alone will tell what the effect of this policy will be, but I am afraid the consequence will be serious.

I know of no remedy unless the legislatures of the provinces enact some law to prohibit such slaughter. It may be that they have not the power to make such a law. The Crown Land Department of this province adopted a regulation making the licensee cut the limbs from the tops of the trees and pile all the brush on the ground. This allows the body of the tree to lie on the ground, where it would rot more quickly and would not catch fire so easily. Personally, I doubt very much whether this would lessen the danger from fire, but, in any case, what is the use of the operator going to all this bother, when his neighbor, who perhaps owns his land outright, refuses to obey such a regulation, and the department has no power to make him do so. There is no denying the fact that, in this province, at least, logs are getting smaller and scarcer each year. When you cut the sapling you cannot go back over that ground again for several generations.

I would like to see a Lumbermen's Association formed in the Maritime Provinces, and such matters as this I have been writing about could come up for consideration and action. I think such an association, rightly run, would be of everlasting benefit to the lumbermen, especially, and to the whole country at large.

I. C. PRESCOTT, Albert, N. B.

With millions of feet of lumber tied up in the woods and in some cases no possible chance of getting it out, the lumbering situation throughout the province of New Brunswick, owing to the scarcity of snow, is said to be serious. In comparison with last winter, which had a comparatively light fall of snow, this winter is considered by the lumbermen to be much worse. Speaking of the situation at St. Martins, A. F. Bentley, M.P.P., reported that unless there was a heavy fall of snow in the near future the lumbermen in that vicinity will be placed in a serious predicament. Personally, he has about 1,000,000 feet of lumber cut and ready for yarding. Much of this will be tied up unless snow comes soon. Fortunately they had their mill this winter on the main road and as a result several thousand feet of lumber had already been stocked. Chopping operations were being carried on and would likely be continued for some time. The situation in the Salmon River District he reports as not being so bad. In the highlands there is considerable snow, and much progress is being made. The reports which come from up the river are discouraging. The chopping operations were discontinued some days ago and everything is now in readiness for hauling the logs to the streams, a work which cannot be carried on without considerable snow.

An Average Year for Nova Scotia

Production was about Three Quarters of the Average—Prices showed Little Change—Strong Competition Abroad

The products of the forest manufactured in the province of Nova Scotia during the year 1910 are estimated at a value of $5,480,000. Of the 13,483,000 square acres which make up the province, 2,000,000 acres are estimated at present to be in woods and 5,750,000 acres in forest lands.

The quantity of timber cut in Nova Scotia during the winter of 1909 and 1910 probably did not exceed 75 per cent. of an average cut. The winter was very mild, and the snowfall light. There was a remarkable lack of frost, and conditions generally combined to increase the cost and reduce the cut considerably below what was anticipated. In its effect upon lumber market conditions, however, this combination of factors was not a serious drawback. The demand from foreign markets during the year was scarcely sufficient to absorb the supply.

The Argentine Republic, Cuba and other foreign markets took about an average quantity of lumber. The United States market, which was expected to increase its activity, was disappointing, and the season closed with unsatisfactory shipments to that market, both hemlock and lath being sold at prices lower than the cost of production. The Cuba and West India markets were about normal, taking a full average quantity at prices which brought a fair profit. The decline in shipments to the Argentine Republic amount to about 7,000,000 feet of white pine, 23,000,000 feet of spruce, and 58,000,000 feet of pitch pine. A considerable quantity of this decline is attributable, no doubt, to the extensive shipments which were made during the year 1909.

A Fairly Satisfactory Year's Trade.

Viewed from the standpoint of a lumberman, the record of the business of the year 1910 was fairly satisfactory. It was not by any means a banner year, yet it showed a healthy and flourishing condition, and concluded with fairly bright prospects for the year 1911. The prices realized were about the same as those during 1909, but on account of the increased cost of production, particularly in wages, supplies, etc., the profits of the lumber trade were smaller than in the previous year. In spite of the increased cost of production, manufacturers were not able to force prices upward because of the strong competition in their foreign markets from the producers of other countries. In Great Britain, for instance, the products of Norway, Sweden and Russia were imported in great quantities, so that consumers were able to do without Nova Scotia spruce, unless they could get it at figures which showed no advance to correspond with the increased cost of production. The home market for hardwoods in Nova Scotia was seriously depressed by the heavy importations of pitch pine. The American markets for both spruce and hemlock fell off early in the summer, and failed to recover during the balance of the year. The indications, however, are for a recovery in the near future. In the past the production of these woods has been in excess of the demand.

Exports About Two Hundred and Ninety Million.

As nearly as can be estimated at present, the total exports of lumber to all countries from Nova Scotia during 1910 amounted to 290,000,000 feet, which were made up approximately as follows:

	Feet.		Feet.
Halifax	43,000,000		
Lunenburg	46,269,113	Yarmouth	13,597,452
Bear River	3,500,000	Colchester	70,000,000
Pugwash	19,204,020	Windsor	12,000,000
Liverpool	5,954,000	Hantsport	4,500,000
Maitland	5,147,744	Walton	1,200,000
Pictou	12,227,164	Cheverie	200,000
Sherbrooke	4,500,000	Parrsboro	32,000,000
Weymouth	12,000,000		
Ingram Docks	9,000,000	Total	294,299,493

To these figures there must be added an equal or considerably greater quantity for home consumption, which places the quantity of lumber manufactured at from 600,000,000 to 650,000 feet.

Markets Not Over-Supplied.

Information received from the various markets to which Nova Scotia exports lumber is to the effect that there is no over-supply at present. If industrial conditions in the United States should return to their normal channels, it is confidently expected that there will be an active demand for all the lumber that Nova Scotia can produce. The English market, which is of especial importance to the shippers in Eastern Nova Scotia, was badly disturbed by the political situation in 1910. The demand, however, throughout the year was fair, and prices were better than 1909. Stocks at present are reported to be light, and everything points to an increase in the demand.

The year 1910 was a record year for the province of Nova Scotia in the matter of forest fires. No definite information can be given as to the loss entailed, but it is believed that hundreds of millions of feet of timber were destroyed. This is all the most regrettable because, since the year 1903, no serious fires had occurred, and it was believed that on account of its excellent fire ranging system, the province had in a large measure passed the age of serious forest fires.

Shipments of lumber from the Miramichi, N. B., during the year 1910 were as follows:

Miramichi Lumber Co.—	
Rossed pulp wood, 33,600 cords, value	$353,300
Laths, 9,540,200 pieces, value	23,850
J. B. Snowball Co., Ltd.—	
Deals, 13,366,979 sq. ft.; scantling, 1,608,474 sq. ft.; boards, 1,477,655 sq. ft.; ends, 841,608 sq. ft. Total 17,294.716 ft. Value	285,350
J. A. Rundle & Co.—	
Scantling, 689,867 sq. ft.; laths, 1,605,100 pieces; value	13,958
R. Corry Clark—	
Spoolwood, 2,662,541 sq. ft.; value	66,742
Geo. Burchill & Sons—	
Deals, 1,122,000 sq. ft.; scantling, 86,000 sq. ft.; ends, 35,000 sq. ft.; total value	18,112
F. E. Neale—	
Deals, 26,661,087 sq. ft.; scantling, 2,416,418 sq. ft.; boards, 1,332,914 sq. ft.; ends, 1,155,156 sq. ft. Total, 31,565,575 ft. Value	447,371
Total invoice value	$1,208,683

The conclusion of the sawing season on the Miramichi found the total output for the season somewhat smaller than the average, though greater than was at first expected. Stocks of manufactured lumber wintered by Miramichi firms are also lighter than usual, and amounted at the close of the season to about 11,500,000 superficial feet of spruce deals (English), and 7,000,000 spruce lath and 2,250,000 shingles. The indications at present are that stocks of long and short lumber manufactured this winter by the portable mills will be light.

The New Brunswick Railway Co. reports that there will be cut on the company's properties this year about 55,000,000 feet of logs, which is about the average. The Miramichi Lumber Co.'s cut will not be as large as usual.

Complete statistics of the lumber trade of Nova Scotia not being available as yet, they cannot be published in this issue. It is hoped in the issue of February 15 to publish an interesting and comprehensive review of the lumber trade in Nova Scotia during 1910.

Newfoundland's export lumber trade for the year has decreased half a million dollars in 1910, the figures for the year's exports being $1,785,267, as compared with $2.355,476 in 1909. The decrease is ascribed to the dull condition of the lumber trade in England.

Great Britain's Lumber Trade Improved

Imports for the Year 1910 show a Considerable Increase—Relative Decrease in Canada's Importance in English Lumber Markets — Reports from Chief Importing Centres—

Statistics published by the Board of Trade show that the importations of wood into the United Kingdom during 1910 were considerably larger than those of any of the three previous years. If the figures are compared, however, with the average of the previous five years, they show only a fractional increase. On the other hand, there has been a decided increase in the average cost. On the same basis of comparison, the cost shows an advance of upwards of 5 per cent. The steady increase in the cost of supplies is shown in the following figures of average import cost per standard:

	£	s.	d.		£	s.	d.		£	s.	d.
In 1910.....	9	9	3	1907.....	9	11	0	1904.....	8	10	3
1909.....	9	0	3	1906.....	9	4	9	1903.....	9	0	0
1908.....	8	16	6	1905.....	8	10	0	1902.....	8	11	6

These figures are the more remarkable when it is considered that there took place, during the same years, a noticeable reduction in the consumption of wood. During the previous four years this reduction in the consumption was not accompanied by commensurate reduction in supplies. The limit of the drop, however, was reached a year ago, and since that time a gradual recovery has occurred, sufficient to justify the increase in stocks which has taken place.

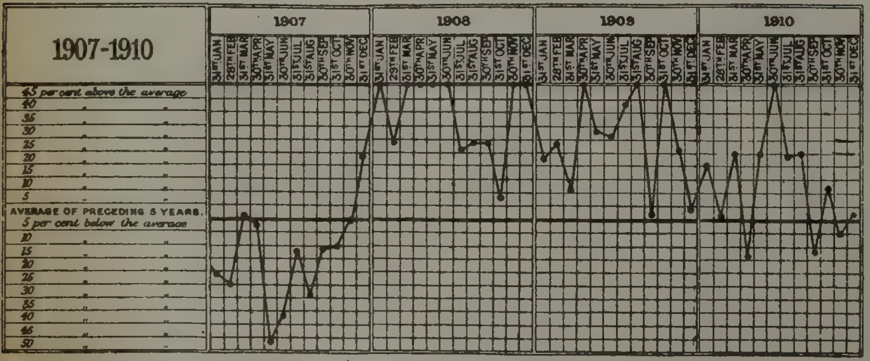
Throughout the year 1910 there have been steady market prices at a level leaving foreign and colonial shippers little to complain of, and there is at present no evidence of any accumulation of stocks. It is thought, therefore, that the consumption has taken that turn for the better which has been awaited so long and so anxiously. This is considered as justification for the unusually large amount of buying that has already taken place for the new season. A definite increase in price has been obtained for the larger sizes.

Imports Into the United Kingdom During 1910.

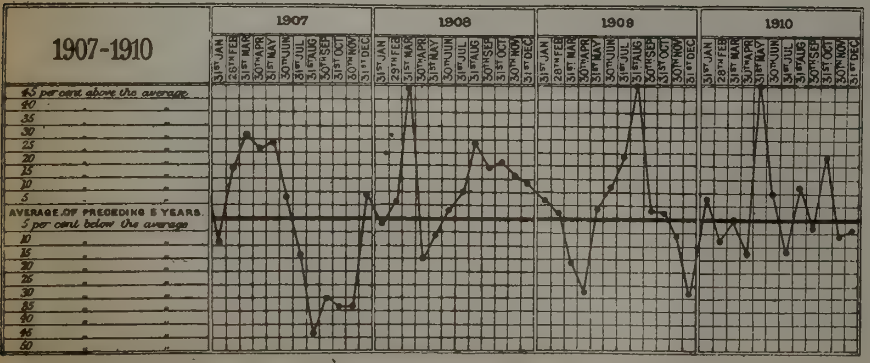
The following table shows the quantity of wood imported into the United Kingdom from 1907 to date:

	1907. Loads.	1908. Loads.	1909. Loads.	1910. Loads.
Colonial deals, battens, etc......	1,128,544	1,000,356	1,050,106	1,105,545
Colonial timber and hardwoods..	45,086	39,660	34,045	33,147
Foreign deals, battens and boards	4,856,879	4,488,091	4,671,975	4,888,084
Foreign timber and hardwoods..	3,467,898	3,843,665	3,394,116	3,613,787
Colonial and foreign staves.....	171,721	147,028	126,339	167,208
Total, in loads.............	9,670,128	9,518,800	9,276,581	9,807,771
Value	£24,873,976	£22,081,622	£21,799,880	£24,331,718

The following diagrams showing the periodical estimates of the duration of supply, in comparison with the averages of the same, at the same time in the previous five years, are based on the monthly statistics issued by Foy, Morgan & Co., London:



Canadian Pine



Canadian Spruce

An important feature during the year, one, in fact, which has been growing more noticeable for the past eight or nine years, was the change in the source of supplies. This is being brought about by the diminished capacity for production in exporting countries, and by the increasing demand within the producing countries themselves. This change is clearly shown by the following table:

	Per Cent. 1910.	1909.	1908.	1907.	1906.	1905.	1904.	1903.
Russian goods	47	46	42	37	35	35	32	29
Scandinavian goods	26	25	29	32	33	34	33	33
Canada and United States goods...	25	27	26	28	29	28	31	33

Pine.—The local markets in Great Britain were exceedingly quiet during last winter and spring, and seemed, therefore, very unlikely to respond to any increase in import cost. In Canada, however, the new productions were meanwhile being disposed of at an average advance of about 4 per cent. on the previous year, which fact, beyond assuring stockholders of the wisdom of a "waiting policy," did little to help a revival in business here. The truth is, that after a long endurance of continually rising prices, pine users are being forced to experiment successively with substitutes of various kinds, some of which have been adopted for special purposes. The season's trade was confined to sales in small parcel lots, buyers not having dared to venture upon transactions of a wholesale character. Prices c.i.f. ruled for 3 x 11-inch £32 10s., £23 10s. and £16, and for 3 x 7/10-inch £22 10s., £17 10s. and £13 5s. for 1sts, 2nds and 3rds, respectively. 1sts and 2nds, and especially 1sts, were in good demand, but 4ths were a drug throughout the season. The stock wintering in Canada is likely to be one of the smallest on record, and as an all-round advance on the prices of the 1911 productions has again been paid by the exporters, the market will have to face a still higher import cost for the coming season.

Spruce.—Owing to the conditions prevailing last January—the shortage of stocks both in Great Britain and at the shipping ports, as well as the firmness of European whitewood—prices opened at an advance of 5s. to 7s. 6d. over the previous year. For Quebec spruce £10 5s. c.i.f. for 3 x 9-inch 2nds, £9 15s. for 3 x 9-inch, and £8 5s. for 3 x 7 and 8-inch 3rds, were the prices established in January, and these have remained practically without change during the season. In the early weeks of the year a considerable business was done, but later on the competition with Rigas and kindred productions was severely felt. The early sales of Lower Port spruce were concluded on the basis of £8 10s. for cargoes of 60 per cent. and 40 per cent. The unsatisfactory character of the logging operations in Lower Canada during the winter, indicating a possible shortage in production, and the improving prospects for the lumber trade of Canada owing to the lowering of the American tariffs, induced the exporters to pay an increase in prices which it proved exceedingly difficult to recover from the markets in Great Britain. Some relief, however, from the burden of the growing proportion of batten sizes in all productions was obtained from the increased demand for boxmaking purposes consequent upon the boom in the export trade of the country. Sales became more frequent about midsummer, when it was evident that prices for all classes of cheap whitewood were likely to strengthen. In August the fact that freights were beginning to move upwards gave a further impetus to buying, and about this period the balances remaining for sale were practically cleared, without any change in prices. The effect of the rise in freights was to check further selling for the remainder of the season (except what was possible by means of the liners) and helped, of course, to keep consignments off the market.

The Year's Trade at London.

The timber trade in London commenced the year with a large over-accumulation of stocks, which had been shipped at the termination of the strike of the Swedish laborers in the previous summer. A dull market resulted, which continued until the end of March. At that time, however, a better tendency appeared, and the markets became much more stable. The results to importers of prepared boards, however, were never very satisfactory during 1910. The stocks which were available throughout the year were too large to make profitable re-sale at all frequent. During September and October there was quite a tendency towards price cutting, which made matters even worse. The general situation, however, commenced to improve in November, and buying ahead commenced at better prices than those which had been in force during the earlier part of the year. This continued in large volume right until Christmas, and at the new year, shippers found themselves comparatively independent for the coming season. Sacrificing of stocks came to an end, and as the consumption also improved, a satisfactory record has been made.

Political Disturbances Affect Trade.

Many political events of importance interfered with business during the year. The death of King Edward the Seventh was the outstanding calamity of the year. Two general elections also served to disturb commercial conditions. The actual consumption of wood depending as it does very largely upon the building trade, was hampered materially by the land legislation enacted by Parliament, and also by what the Government's opponents have styled "the political persecution of capital." In spite of all these factors, however, the wood trade of London experienced a good year, and the indications are that if it is allowed to pursue its own course during 1911, it may look forward to another satisfactory season of trade.

Messrs. Denny, Mott & Dickson, Limited, of London, in their annual review of the wood market, report as follows upon Canadian timber:

> **Waney Pine.**—The quantities of both first and second class waney imported this year have been smaller than for many years past. The demand from Belfast for long wood has absorbed so large a percentage of the limited supplies that the Clyde has received very little, and that market is consequently now bare of stock. The considerable rise in prices, and the further increase which seems inevitable, will naturally force consumers to substitute other timbers wherever practicable.
>
> Oak.—The market has been unsatisfactory all the year, with only a very fitful demand, as the railway requirements were issued; outside such demands for special-sized logs, there has been very little business.
>
> Elm.—The excessive stocks with which the year commenced have been reduced, and with smaller imports during the past season, stocks are in a healthier condition, although the demand is somewhat uncertain.
>
> Spruce.—This market has not been a satisfactory one this year, as the consumption generally has been disappointing. Stocks in the early part of the year were light, and the first shipments arrived on a bare market—when the prospects seemed to be encouraging; the demand, however, was unsatisfactory, and stocks had been gradually accumulating until the autumn, when only the fact of a very appreciable rise in freights having discouraged autumn shipments, prevented a drop in values on this side. As it is, stocks are not excessive; and with any improvement in the demand, better prices should be realized.
>
> Oregon Pine.—The year opened with unduly heavy stocks all round; but with little encouragement from importers here. Shippers abstained from sending forward timber, with the result that although consumption has not been satisfactory, the excess in stocks has in a great measure disappeared, and the outlook so far as timber is concerned is more encouraging. Planking has been imported too freely, with the result that the stocks are excessive in some centres. Decking also continues to be imported in excess of requirements, although with the ending of the shipbuilding strike an improvement in demand should result, especially in view of the fact that waney pine is practically impossible to obtain.

London Imports of Canadian Woods.

Importations of Canadian wood into London during 1910 and previous years was as follows:—

	1906. Pieces.	1907. Pieces.	1908. Pieces.	1909. Pieces.	1910. Pieces.
St. Lawrence—					
Pine deals, etc.	898.000	801.000	521.000	612.000	563,000
Spruce deals, etc.	1,967.000	1,081.000	815.000	857,000	969,000
Birch deals, etc.	217,000	318,000	208,000	243,000	283,000
New Brunswick, etc.—					
Spruce deals, etc.	389.000	884.000	434.000	459,000	635,000
Birch deals, etc.	255.000	219,000	198,000	266,000	326,000

Timber.	1906. Loads.	1907. Loads.	1908. Loads.	1909. Loads.	1910. Loads.
Yellow pine from Quebec	1,009	58	...	74	...

London Pine and Spruce Deal Imports Small.

Messrs Churchill & Sim in their annual London circular make the following remarks upon the market for pine and spruce deals:

> The importation of pine deals into London during 1910 has been almost the smallest on record, and the same remark applies literally to the stock remaining in the docks at the end of the year. Prices have continued the slow and gradual process of augmentation which has been their history now for years past. There must always be a market for the sort of quantity of fine pine deals which now comes here; regardless of cost altogether. If more came than could be disposed of in this limited fashion, prices for the excess would halve themselves directly, but that has not been the case in 1910, and it is very improbable that it ever will be the case again. For spruce deals the London market has been disappointing in 1910. Those coming from the St. Lawrence follow rather in the footsteps of the pine deal market. They are a superior article, commanding their price for certain purposes and only shipped here in sufficient quantities for those purposes. The London market has more to say to those from the Canadian Lower Ports. For these the shipping quotations have been higher than for a long time past throughout the season, and exporters have got and maintained these prices from other markets for the great bulk of their shipments. The quantity sent to London, however, has been somewhat in excess of that of the two previous years, and the demand has been abnormally poor all the while. The resulting dock stock is therefore bigger than in 1908 or 1909, and prices have sagged from month to month quite out of harmony with the extra cost of the importation. The extending supply of cheap white wood from Riga is the reason of this. Buyers would rather have spruce, it is certainly more dependable, but for some purposes Riga white does well enough, so that a cheap quotation turns the scale. Timber from Canada is becoming a thing of the past for this market. There has been no yellow pine timber sent here in 1910—practically none since 1906. Of the hard woods, elm and birch are the only two of which the market takes notice. The importation of elm has been larger than usual in the past season. It has been in good demand, and the increase in the dock stock is only a small one. Of birch the supply from the St. Lawrence has been about normal. It also has passed very freely into consumption. The supply of birch timber from the lower ports almost failed last year. The wood has come in the shape of planks. These were difficult to sell in the earlier months of the year, but have found a better market as time went on, and supplies being very scarce in the Colony, a substantial rise in prices has now been established.

The maple flooring business in London during 1910 was on a smaller scale than during 1909. The falling off is ascribed to the increased demand for roller skating rink floors. Prices, however, were maintained at a high level, though they were somewhat lacking in regularity. Fair prices were obtained for round oak logs of good size and quality. Inferior or small logs were practically unsaleable.

Values Well Maintained at Liverpool.

At Liverpool the year 1910 was characterized by fairly well maintained values in spite of the continual political disturbances. There was a satisfactory consumption and at the close of the year prospects were considered to be much more encouraging than they had been for a considerable time past. The aggregate arrivals in the Mersey during the month of December were above the average. The consumption in the aggregate shows an increase of 3½ per cent. as compared with 1909. With few exceptions stocks at the beginning of the year were light. As usual arrivals of Quebec square and waney pine timber were extremely light. The arrivals of Quebec pine deals, sidings, boards, red pine, etc., were slightly greater than those of the previous year, amounting to 21,535 standards, against 19,607 in 1909. The demand for pine deals was dull until late in the season when a better enquiry developed and values stiffened. It was difficult, however, throughout the year to obtain the cost of importation. The consumption was disappointing and stocks at the end of the year were too heavy, although less than a year ago. Red pine deals and boards were imported to the extent of 4,500 standards. Stocks continued adequate and values firm throughout most of the year. Arrivals of spruce deals totalled 10,000 standards, which is about 2,500 greater than in 1909. The deliveries were satisfactory and the stock continued moderate during most of the year.

Heavier Imports From Maritime Provinces.

The import of spruce and pine deals from New Brunswick and Nova Scotia was considerably greater than during 1909, amounting to 93,530 standards, compared with 89.000. This is the heaviest import since 1906. About 60 per cent. of this went to Manchester, the balance to Liverpool, Birkenhead and Garston. At the beginning of the season stocks were moderate. Consignment cargoes continued at steady values throughout the year. Deliveries kept pace pretty well with the arrivals, but importers had to face strong competition from Riga, etc. There was a fair importation of hemlock, but values were rather fluctuating. Pine deals from the Maritime Provinces arrived somewhat more freely than in 1909, but the demand was slow. At the beginning of 1911, stocks were not too large, but values were somewhat easier. The import of British Columbia and Oregon pine was much smaller than in the two previous years. The consumption increased considerably, so that stocks are now materially reduced. The demand for oak logs was restricted almost entirely to a few railroad requirements, and the arrivals amounted only to 54,000 cubic feet. At the beginning of 1911 the stock was 24,000 cubic feet, which is light, and the values were steady. It was difficult throughout the year to place second-class oak. Square rock elm arrived somewhat more freely than in 1909. Deliveries were satisfactory, stocks light and values advanced somewhat. Round rock elm was in better demand. An extensive business was done in round log ash. The import of Quebec birch was even less than that in 1909. Arrivals amounted to 123.200 cubic feet, against 131.380 in the previous year. The demand was quiet, but the stock was gradually worked off, leaving a bare market. Towards the end of the year the enquiry improved materially. Round maple logs of good size, sound and fresh, met with a limited demand.

Imports Into Liverpool, Birkenhead and Garston.

The following is a table showing the consumption and import of Canadian lumber deals, etc., into Liverpool, Birkenhead and Garston for the year ending December 31, 1910, with comparisons with the two previous years:

	—Consumption.— From 1st Jan. to 31st Dec.			—Import.— From 1st Jan. to 31st Dec.		
	1908.	1909.	1910.	1908.	1909.	1910.
Quebec square pine, ft.				27,000	19,000	3.000
Quebec waney pine	163,000	115,000	84,000	107,000	68,000	45,000
St. John and other ports pine	Nil.	Nil.	500	Nil.	500	Nil.
Red pine	7,000	Nil.	5,000	6,000	Nil.	5,000
Oregon pine	295.000	211,000	325.000	335,000	284.000	157.000
Oak, Can. and U. S.	182.000	125.000	114.000	273.000	63.000	92.000
Oak planks	1,886.000	1,280.000	1,333.000	1,992.000	1,259,000	1,196,000
Elm	31,000	31.000	41.000	25,000	24.000	38,000
Birch logs	220.000	231,000	161,000	187.000	238,000	136.000
Birch planks	306.000	361,000	318.000	348,000	377,000	269.000
Ash	134,000	151,000	155,000	127,000	144,000	163,000
N. B., etc. spruce deals stds	34,480	37,560	36,320	35,080	35,600	38,450
N. B. pine deals, stds.						
Que. yel. pine deals, stds.			16,140			14,210
Que. red pine deals, stds.	19,270	21,040	4.250	20.400	16.580	4,270
Que. spruce deals, stds.			4,620	2,750	4,000	4,730

Imports Into Manchester.

The following table shows the consumption and import of Canadian lumber deals, etc., into Manchester for the year ending December 31, 1910, with comparisons for the two previous years:

	—Consumption.— From 1st Jan. to 31st Dec.			—Import.— From 1st Jan. to 31st Dec.		
	1908.	1909.	1910.	1908.	1909.	1910.
Quebec board pine, ft.			406,000			266,000
Quebec square pine	533,000	484,000	19,500	473,000	447,000	2,000
Oak, Can. and U. S.	32,000	22,000	18,500	23,000	6,000	19,500
Birch logs	93,000	71,500	54,000	90,000	73,000	51,500
Birch planks	183,000	231,000	262,500	154,000	369.000	119.500
Spruce deals, stds.	56,370	58,930	56.980	52,490	55,390	57,520
Pine deals, stds.	4,650	5,340	5,570	5,940	5,290	5,560

Stocks of spruce and birch in Liverpool and Manchester at the close of the year 1910, with comparisons for previous years, were as follows:

	1906.	1907.	1908.	1909.	1910.
Spruce, Stds.—					
Manchester	26,580	20,100	16,220	12,680	13,220
Liverpool	11,620	7,160	7,760	5,800	7,930
	38,200	27,260	23,980	18,480	21,150
Birch Logs, Loads—					
Manchester	220	180	120	150	100
Liverpool	1,700	1,040	380	520	20
	1,920	1,220	500	670	120
Birch Planks, Stds.—					
Manchester	879	564	388	1,224	358
Liverpool	800	242	497	594	297
	1,679	806	885	1,818	655

The Year's Trade at Glasgow.

The lumber trade at Glasgow is reviewed by Messrs. Edminston & Mitchell in their yearly timber circular, in part as follows:

"In reviewing the trade of this market during the year just closing, we have to report that the conditions prevailing were more or less unsatisfactory throughout, and while there may be cause for congratulation that some little improvement is shown in the consumption as compared with the previous year, it still leaves very much to be desired. Few of the kindred trades have shown any great recuperation during the year, and shipbuilding, which was proving the mainstay of the trade in the earlier months, was latterly brought almost to a standstill on account of a general lock-out being declared, ensuing on labor troubles. This went far to upset the general stability of the market, and had a very adverse effect on the consumption, as it not only effectively closed this source of outlet for the time being, but caused buyers to adopt a policy of caution pending developments.

"The overhead consumption shows a gain on 1909 of approximately 10 per cent., but trade during that period was exceptionally dull, and the comparison is to some extent misleading. To take an average year, say 1906, when trade was normal, the total consumption then was 258,000 loads of log timber and lumber, as against 183,000 for the past year, revealing a shrinkage of as nearly as possible 30 per cent.

"Imports generally were on lines of moderation, the only outstanding exception being perhaps in the case of pitch pine, the import of which was in excess of that of last year by 7,000 loads. To the moderation in imports, more than anything else, is attributable the fact that values as a whole have kept comparatively steady. The stocks remaining on hand at this date may be said to be, with few exceptions, of a thoroughly healthy nature, and to favor the likelihood of values being at least maintained.

"With regard to the allied trades. Housebuilding has remained in a state of acute depression, from which there is little prospect of it emerging for a considerable time yet. Cabinetmakers have been quiet, as were also boxmakers. Wagonbuilders have been moderately busy, and the prospects in this industry are quite good.

"The Clyde shipbuilding returns reveal a rather disappointing output for the year, but this is not to be wondered at in view of the set-back experienced on account of the 'lock-out,' which caused an entire stoppage of work for fully three months. The total outturn for this and the two previous years is as follows:—1910, 350 vessels, aggregating 390,000 tons; 1909, 320 vessels, aggregating 405,000 tons; 1908, 569 vessels, aggregating 356,000 tons. But for the 'lock-out' the output would have shown a very considerable increase on either 1909 or 1908. It may be mentioned that in the record year of 1907, tonnage to the extent of 620,000 tons was launched from the Clyde. Prospects for the coming year are decidedly good, many of the yards being assured of steady employment for a long time to come, and the orders for new vessels recently placed include the new 50,000-ton Cunarder and several battleships and cruisers for the British Admiralty.

"The trade has been wonderfully free from serious financial difficulties, which is the more remarkable in view of the prolonged spell of depression it has come through, and this may be assigned to the indisposition of sellers to take any avoidable risks.

"It is pleasing to report that the market prospects for the coming year are, without being duly optimistic, reasonably good, as apart from the revival in shipbuilding, various other of the allied trades have shown decided improvement of late, and while it would be rash to prophecy anything in the nature of a boom year, the present prospects justify the expectation of business being much better than has been the case for many years back.

Imports From British North America.

"White or Yellow Pine Logs.—The popularity of this wood is manifested by the fact that for the last two years the consumption more than equals the import, and this in spite of the price advancing in proportion. The quantity available, however, permits of its use more as a luxury than as a commercial commodity. The total import for the year only amounts to 1,477 loads (1,431 loads waney and 46 loads square), while the consumption totals 2,000 loads. We are left with a stock on hand of 1,392 loads, 80 per cent. of which is waney. Various substitutes have been tried, with varying success, and during the year a few parcels of Siberian pine logs have reached this market. This timber resembles closely Canadian pine in texture and appearance, and the market awaits further developments.

"Red Pine Logs.—The business in this once extensively-used timber has practically reached the vanishing point, pitch pine having displaced its use almost entirely. One or two trifling shipments came forward during the year, these being sold with difficulty, and there is no stock on hand.

"Elm Logs.—The import during the year was moderate in extent, totalling 966 loads, in comparison with 1,322 loads last year, and was largely made up of contract shipments. A fairly steady demand was in evidence, chiefly for first-class rock elm of large average, and the consumption of 1,575 loads is on similar lines to that during the last few years. The stock remaining on hand amounts to 1,193 loads, average 47 cubic feet per log, and is by no means excessive. Values were maintained on a steady basis on the whole, and particularly as regards large average wood.

"Oak Logs.—The railway companies, who are the chief consumers of this timber, evinced little disposition to buy to any extent during the year, owing to their strict pursuance of economies in all directions. Considering this, the consumption for the twelve months works out wonderfully well, representing 1,596 loads, and is almost identical to that of last year, which must be looked upon as satisfactory under the circumstances. The stock on hand stands at 1,690 loads, and although somewhat heavier than a year ago, is of quite reasonable extent.

"Ash Logs.—This is another wood that has quite gone out of favor during recent years, being but little used nowadays. As a furniture wood it has ceased to exist, American oak having displaced it in this respect, and the cheap varieties of mahogany now available have also been a contributing factor to its detriment. Only one or two small parcels came forward, these being disposed of with difficulty and at low prices.

"Birch Logs (Quebec).—The past season's import only amounted to 750 loads, and was quite insufficient to cope with the market's requirements. The consumption shown is 975 loads, and there is no stock remaining on hand. Values ruled firm. Planks were also in good request at full prices, and there is no stock now in first hands. Low Port.—The import of logs was light, and was readily absorbed, and the market has been quite bare of stock for some time. Quite a good business was effected in planks, the consumption comparing favorably with recent years, and values ruled firm.

"Deals, Boards, Etc.—The import of Quebec goods, while in excess of last year by about 2,400 standards, was by no means heavy, but at the same time it proved of an ample nature to meet the rather apathetic demands existing in this market. The considerable increase revealed in the consumption is somewhat misleading, being attributable entirely to the increased import of spruce from the Quebec province, and it will be observed that there is a corresponding shrinkage in the consumption of Low Port deals. As regards pine, the little demand in evidence has run chiefly for the higher grades and specifications of broad average, values on which were well maintained; but the lower qualities were in poor request, and values receded somewhat. Spruce was a fairly good market, at steady values generally. Reds have again moved very slowly in sympathy with the continued depression in housebuilding. Stocks for the most part are of quite a healthy nature.

"Lower Port Pine and Spruce.—Arrivals during the year were on a reasonable scale, but were not too readily absorbed, the demand on the whole being rather slow, and the values in consequence not over steady. The stock of spruce on hand is about double of what it was a year ago, but at the same time is of quite normal dimensions. Pine was very little in request, and it was only by reducing prices that sales were made possible."

Canadian Borrowings Abroad

Canada's development in 1910 is indicated in fair measure by the extent of her commercial borrowings. The following figures give Canadian flotations in London, Eng., and abroad during 1910:

Government bonds	£10,975,000
Railway bonds	6,965,942
Municipal bonds	3,299,497
Mines, etc.	4,174,467
Industrial companies	1,856,252
Land and lumber companies	4,136,055
Financial and miscellaneous	1,116,500
	£32,523,713

Under the heading of land and lumber companies, the following flotations are included:

Jan. 10—Ocean Falls Co., Ltd., £300,000 6 p.c. 1st mort. ster. bonds, at 97 p.c.	£ 291,000
Apr. 14—West Canada Land Co., Ltd., £300,000 5 p.c., at 100 p.c.	300,000
Apr. 16—B. C. Development Assn., Ltd., £39,500 5 p.c., at 105 p.c.	41,745
Apr. 13—Canadian Western Lumber Co., Ltd., £1,500,000 5 p.c., at 88 p.c.	1,320,000
June 16—Dominion Sawmills & Lumber, Ltd., £800,000 6 p.c. 1st mort., at 95 p.c.	760,000
June 27—Swanson Bay Forests Wood Pulp & Lumber Mills, Ltd., £150,000 6 p.c., at 100 p.c.	150,000
Nov. 7—Canadian Mills & Timber, Ltd., 500,000 shares at 4s each	100,000
Nov. 14—Price Bros. & Co., Ltd., £1,000,000 5 p.c. 1st mort. bonds, at 87 p.c.	923,100
Nov. 21—Anglo-Canadian Lands, Ltd., 250,480 shares, at 100 p.c.	250,480
Total	£4,136,055

Ontario Will Keep the Pulpwood

The suggestion contained in the tariff arrangements recently concluded at Washington, that the provinces of Quebec and Ontario should remove their prohibition of the export of pulpwood cut from Crown lands is not likely ever to have any effect. Hon. Frank Cochrane, Minister of Lands, Forests and Mines for Ontario, in an interview upon the subject said: "It has not yet been considered or discussed by the Government, but I may say personally that I would be strongly opposed to any change in our existing policy. For three years past, in all pulp concessions advertised by the Crown, we have imposed the condition that the pulp should be manufactured into paper in Canada. My own view is that this is the proper course to pursue if we are to develop the natural resources of our back districts as we hope to see them developed. In justice to the industrial possibilities of our great north country, and in the interests of the settlers for whom we desire to provide local markets, and also having regard to the proper conservation of our resources, I could not recommend any other course."

The Forestry Convention

The second annual Canadian Forestry Convention, which was held in Quebec on Jan. 18, 19 and 20, was well attended. A great many matters of interest to the members were taken up and discussed. From a lumberman's point of view, the most interesting feature of the convention was the adoption of a resolution recommending that railways be held responsible for damages resulting from forest fires, whether due to negligence or not, for which their locomotives are responsible. This abrogates the section whereby, if the company has taken proper precautions, the penalty is limited to $5,000. A recommendation was also passed that the provinces should employ technically trained foresters in their work. Another resolution approved of the principle of having timber which is cut on Crown lands manufactured within the country.

An Active Season on the Prairies

Rapid Growth of the Country Makes Steady Demand for Lumber—An Excellent Outlook for 1911

The prairie provinces of Canada, lying half-way between the lumber-producing east and the lumber-producing west, and having of late years become quite an important factor also in the production of lumber, have a considerable bearing upon the lumber markets of the rest of Canada. The great expansion of the prairie provinces in a commercial sense during the last decade, especially during the last five years, has created a large and growing demand for lumber, which, in considerable measure, has been supplied by the mills of British Columbia and those of the middle northern States. Although the prairie provinces have been producing more and more lumber themselves each year, it is probable that for many years to come they will, on account of the extent of the country and its rapid filling up, consume a vastly greater amount than they can ever hope to produce.

An analysis of the events of the past year in the lumber markets of the prairies leads directly to the conclusion that the year was a satisfactory one, generally speaking. Unsatisfactory conditions developed at times, but their influence was confined to a brief period, and was not widespread in its effect. During the last five months of the year, for instance, the light crops of the southern part of Manitoba reduced the total volume of the year's lumber trade considerably. Throughout the other parts of the three provinces, however, the trade was above the average. The lumber dealers of Saskatchewan, in particular, enjoyed an active year's trade. It may be said, however, that the uncertainty in connection with the crop situation had a generally adverse affect throughout the provinces, and that, had it not been for this feature, there would have been a record year's business for the prairies. In the city of Winnipeg, there was an active trade during 1910. No less than 20 retail yards were competing for the business. There was a strong demand for the better grades, as a result of the increased number of more substantial buildings which were erected. The good demand enabled dealers to get along with much less of price cutting than was usual. The margin of profit was closer than formerly, but the volume of trade recompensed the dealers for this.

Competition From the United States.

An important factor in keeping down the margin of profit was the large quantity of lumber which was imported from the United States. These importations consisted largely of low-grade stock, and to some extent they caused fluctuation in prices at Winnipeg and throughout the provinces. A number of large contracts had to be cancelled because of the Winnipeg builders' strike, but the result of this disturbance was not so serious as it was expected to be. Taking the year as a whole, therefore, there was a fairly steady flow of business, at prices which were close, but nevertheless profitable, and the number of disturbing elements in the trade was comparatively small. Most of the dealers throughout the provinces commenced the present year with a feeling of confidence that they will have a satisfactory year's trade. The total volume of building is expected at least to be equal to that of last year, and it is not unreasonable to presume that it will be even greater. Immigration into the prairie provinces is expected to exceed that of any previous year. Although the crop conditions cannot be foretold, it is confidently expected that, even with an ordinary crop, the year will be a record one. An early resumption of business is expected in the spring. Generally speaking, the situation is normal and the country is prosperous. It is reasonable to expect, therefore, that the lumber trade will have a satisfactory year.

As a producing section, the district around Prince Albert is one of the most important in the prairie provinces. This district enjoyed one of the best seasons in its history during 1910, and as a result the logging industry during the present winter is being carried on with great zeal. There are many more lumbermen in the woods this winter than usual, and in addition to the large mills already located at Prince Albert, an extensive plant is being erected at Big River, on the Shelbrooke extension of the C. N. R. This branch of the railway has rendered available immense timber limits just over the height of land. As an indication of the extensive operations which the new plant will have, it may be mentioned that a steam-heated pond is to be installed where the frost can be taken out of the logs before they go to the saws. The plant will be one of the largest on the continent of America.

Shortage of Stocks at the Mills.

The volume of business done by the prairie provinces' mills during the year 1910 was possibly less than during 1909. This was not the result of any falling off in the demand, but was caused by a curtailment in the cut at the mills, as a result of the unfavorable logging conditions which prevailed during the winter of 1909 and 1910. In the spring and summer of 1910, also, the driving conditions on the rivers were unfavorable. Some of the largest mills cut considerably less than they had in the previous year. Reports from the same mills, however, indicate that during the present winter, conditions have been fairly promising, and that on account of the rapid growth and opening up of the country, an extra good season is anticipated during 1911. Retailers in the Prince Albert district and, in fact, in practically every district throughout the prairies, are counting upon a heavy year's business.

Local conditions had such varying effects upon profits of the lumber trade that it is difficult to give any definite figures of the results. One of the largest mills reports that profits were not so favorable as in 1909. Other mills, however, report that they were about the average, while one mill manufacturing about seven million feet during the year, reports an increase of 20 per cent. in profits, and another manufacturing some ten million feet annually, reports that its profits were about 50 cents per thousand better. This mill gives the average price for 1910 at $21.30, and for 1909 at $20.80. Stocks at mill points in the prairies at the beginning of 1911 are reported as low. As an indication of the general feeling throughout the trade, the following expressions of opinion are interesting:

A Few Views of Lumbermen.

S. Standish, Banff, Alta., says: "Business was much better in 1910 than in 1909, and will continue to grow as the Canadian prairies fill up with people."

Cushing Bros. Co., Ltd., Calgary, Alta., say: "Trade conditions for the past year have been very favorable, and for the present we are anticipating a very prosperous year."

J. H. Stewart, Fortier, Man., says: "The lumber trade was good in this district this year. My trade is all with farmers, and they are in better financial condition than at any time in the history of this district. The prospects for 1911 are bright."

M. D. Irvine, Elstow, Sask., says: "Conditions of trade have been favorable—that is, the volume of trade has been good. The crop in this section has not been good, but collections have been fair, considering the crop and the newness of the country. The prospects for 1911 are not so bright, but just the same there is a good share of business in sight for next year. I feel sure if dry farming was adopted more here we would practically have no year that would be a failure. We expect as much, if not more, immigration next year as this."

Patterson Bros. Lumber Co., Birtile, Man., say: "We are pleased to report one of the most successful years in the history of Canada. We have harvested a 'bumper crop'; wheat has averaged twenty-five bushels per acre, and other crops in proportion. Prices are firmly good, and farmers are making money. The lumber trade has been good, with the best prospects for next season. We have more snow up to date than at the same time in past years. This will be a benefit to next season. We are looking for a big rush of emigrants to this section next year."

A. Johnstone & Co., Ltd., Hardisty, Alta., say: "Building conditions in the past year have been exceptionally good. Some parts of the district have suffered on account of the dry season, but this is only local, and as a rule is only confined to small parts of this district. The lumber business has been about 30 per cent. better than in the year 1909. We are looking for an increased business next season. All signs point to a heavier immigration to this country than ever before. With prospects for a good crop next spring, building in this part of Alberta will exceed all former years."

R. C. Thomas, Calgary, Alta., says: "Business conditions during the past year have been very bright, although the crops were reduced owing to the dry season, which prevailed generally over the whole of the western continent. The prices for all farming commodities are unusually high, which has somewhat counteracted the adverse country conditions, which otherwise would no doubt have prevailed. This is a phenomenal country, as no doubt you have heard. The fall wheat is a success when farmed on modern dry farming methods, as summer fallow conserves sufficient moisture in the land to carry the crop through under normal conditions. All small towns, and especially Calgary, which is the commercial metropolis of Alberta, have more than sustained their real estate values. Farm lands also have not been affected in price by the dry spell, and if anything have advanced, owing to their previous low values, coupled with the tremendous railway development going on all over this province and the provinces to the east of us. The building trade in our city has increased from somewhere about two millions in 1909 to something over six millions in 1910. There is work mapped out for 1911 for something over ten millions, and this I consider a very conservative idea. As I have pointed out previously, the whole of this district is in a phenomenal state of development, and somewhat difficult for an outsider to realize."

The British Columbia Lumber and Shingle Manufacturers' Association has sent the following wire to Premier Laurier: "The British Columbia lumbermen urge most strongly that lumber be included in the Australian preference as most important to the interests of this province."

Miscellaneous News from British Columbia

President Lockman, of the Mountain Lumbermen's Association of Kootenay, accompanied by W. A. Anstie, secretary of the association, interviewed the British Columbia executive recently with respect to the log scale used in connection with the prosecution of the timber industry east of the Cascades. The well-known Doyle scale is at present in vogue, and has been for some time past. In 1897, legislation was adopted conferring upon the Government power to adopt a uniform scale for British Columbia, and this scale was introduced in the territory east of the Cascades by an order-in-council passed in January, 1908. It is now held by lumbermen that, by reason of smaller timber growth to the east of the Cascades, this scale is not fairly applicable as it is with respect to heavier timber of the seacoast, and the present request of lumbermen is in effect that the provincial scale be not forced, and that authority be given them to continue the use of the Doyle scale. The interview terminated with a promise by representatives of the Mountain Lumbermen's Association that in the near future they will transmit to Victoria a concise statement supporting their application with an epitome of the evidence and arguments offered in their interview with the executive, This statement will be submitted to Chief Timber Inspector Andrew Haslam, and action thereupon by the executive will be taken,

With a cut that will total 100,000,000 feet for the year 1910, exceeding the previous year by 30 per cent. the Canadian Western Lumber Company is looking forward to a busier year than ever next year. The lumber shipments for the year will be about 85,000,000 feet. The prospects for next year are very bright, and the shipments for November and December have been 50 per cent. higher than for the same months last year. The stock of lumber is 15 per cent. lower than last year on account of these busy months. After March 1 it is the intention to operate the mill night and day in order to keep up with the orders. It is expected that the new sash and door factory and cedar mill will be in operation early next summer.

The decision of the Dominion Government to dredge the north arm and main channel of the Fraser River, in British Columbia, will be greeted by the lumbermen of that district with much approval, as it will render their plants much more valuable. The dredging will enable vessels to reach the mills of the Fraser River from the deep water in the south arm. For this reason the future development of the sawmilling industry on the Fraser River depends very largely upon the proposed improvement.

During 1910 there were, from data now collected, covering Ontario, Manitoba, Alberta, Saskatchewan and British Columbia, 2,019 serious forest fires, doing great damage. This does not include the small fires, but only those that are regarded as serious. Neither does it include Quebec, nor the eastern provinces. Of these 2,019 serious fires the railway caused 489; unknown causes, 511; the remainder were caused by campers, prospectors and others.

Canadian Exports of Wood Goods

Exports of wood and manufactures of wood from Canada during the eight months of the fiscal year ending Nov. 30, 1910, amounted in value to $40 140.150, against $40.758.172 during the corresponding period of 1909. The exports to Great Britain during the eight months of 1910 were valued at $10 586,124, and those to the United States at $25.923.239. The principal items of export during the eight months of 1910 and the corresponding period of 1909 were valued as follows:

		——1910.——		
	1909.	Total.	To United Kingdom.	To United States.
Logs	692.004	834 010	22 748	807.173
Lumber—Deals, pine	1.575 817	1.394.310	1,337.629	22.746
Deals, spruce and other	5.383 382	5.673 603	5,370.542	199.118
Laths, palings and pickets	1.644.564	1.556.287	65.713	1.379 030
Planks and boards	17.460 042	16.818.494	1,363,271	12 661.361
Shingles	1,896 185	1.365 852	......	1,337.742
Timber, square	690.423	915.959	905,124	3.260
Wood blocks for pulp	4.764.108	4.871.585	......	4,871.585
Wood pulp	3 327,134	3,489,506	190 355	3,204,236

Forestry Branch, Collective Statistics of Cut

The Forestry Branch of the Department of the Interior, Ottawa, is sending out schedules to the various lumber manufacturing and woodworking companies throughout Canada, asking for information regarding their output for the year 1910. Upon the information received in this manner, the Forestry Branch bases the annual report of the lumber trade, which it issues each year, and which is of great interest and benefit to the trade. By filling up these schedules and returning them without delay, those who receive them will assist the Forestry Branch in completing the report at an early date. It is of much importance that all companies should return these schedules, so that the report issued by the Government may be representative of the whole lumbering and woodworking industry.

Lumber Matters in the Law Courts

Charged with Theft of Logs—Switching Charges Dispute Importance of Using Safety Guards Emphasized—Jobber

That the use of a safety guard on a woodworking machine in which the operator is exposed to danger, is a wise precaution on the part of an employer, and not only a duty in the interest of the employe, is well indicated by recent events. In a factory at Dundas, Ont., an employe was recently injured by a saw, having two fingers and the thumb of his left hand taken off. He brought action against the company, and the company making no defence, he was awarded $1,000 damages. Recently two other accidents occurred, in the same factory, but, as the machines were equipped with safety guards, the employes did not bring any action against the company.

The frequency of accidents in woodworking establishments makes it essential that every possible precaution should be taken for the protection of the employes. Accidents, of course, will occur even where there are excellent safety devices in operation, but the duty of the employer is to see that all possible precaution is taken to protect his employes. Most of the safety guards in use, for the protection of employes who work with saws, are very efficient, but it is necessary in all cases that the employe himself exercise extreme caution to prevent accident. Recently, at the Westinghouse plant in Hamilton, a regrettable accident occurred, as a result of which an employe was struck in the stomach by a safety guard which he had failed to adjust properly, after another employe had been using it on a different class of work. The injuries proved fatal. The evidence showed that if the employe had used the guard properly, the accident would have been averted.

This, and numerous other serious accidents which are continually occurring, all point to the one moral that the only thing which will prevent accidents of this nature is a combination of an efficient safety guard and unremitting care on the part of the employe. So far as the employer is concerned, his first duty is to instal guards, and then to see that the employes understand them and use them invariably.

Malcolm Watts, a settler and lumber jobber of Foley township, Parry Sound District, Ont., who was arrested by Provincial Constable Connor, charged with cutting off the ends of saw logs and effacing the lumbermen's stamp in order to obtain pay a second time for the logs, was recently committed for trial. The logs in question were cut and paid for last winter, but were "hung up" by reason of a sudden break-up of the winter. Watts, who had a continuing contract with the Conger Lumber Co., is said to have had his men remove the logs from the old skidway to a new one, saw the ends off, and have them re-marked as new logs.

The Guardian Assurance and the Royal Insurance Companies have inscribed an appeal against a judgment of Mr. Justice Guerin of Dec. 1, which condemned them to pay $1,170.67 indemnity to the Eastern Townships Lumber Co. for some property in Bolstrode, Que., that was burned out. The ground of the appeal is that the company did not disclose the risk of fire attendant on the property in question, and that the policies were therefore invalid.

An appeal by the Laidlaw Lumber Co. against a decision given by Mr. Justice Clute in favor of the Grand Trunk Railway, in an action brought by the latter to recover switching charges paid by the plaintiff to the C. P. R. for switching shipments of lumber into defendant's yards, has been dismissed.

Ontario Sash and Door Association

The Ontario Sash and Door Manufacturers' Association held a meeting at the King Edward Hotel, Toronto, on January 27, at which there was a good attendance, and at which a quantity of routine business was transacted. In addition to the regular business, the members indulged in an interchange of their views about trade conditions. There was a distinct feeling of optimism displayed in regard to the benefits which are resulting from the formation of the association. Everyone was well satisfied that they were on the right track in being organized. The very fact that they were able to get together periodically and talk over their trade grievances was a distinct advantage, and the manner in which many of their troubles had already been overcome by the work of the association was a source of great satisfaction to them. The former officers were re-elected for the ensuing year, and the directorate was also re-elected, with the addition of the name of Mr. A. H. Diver, formerly of Trenton, now of Sarnia. A discount list for the province was drawn up and agreed to, based upon the revised Universal Price List.

Progressive Ottawa Lumber Company

McAuliffe-Davis Firm, though only Incorporated Last April, Making Excellent Name among the Trade

Mr. W. H. McAuliffe, Ottawa

Among the large and progressive firms of Ottawa, Ont., at the present time, is that of the McAuliffe-Davis Lumber Co., Ltd., wholesale and retail dealers and manufacturers of rough and dressed lumber. Although only incorporated since April 7, last year, this firm is well known all over Ontario and Quebec.

On its incorporation, in April 1910, this company took over the then existing lumber business of W. H. McAuliffe, the McAuliffe Lumber Co., the Chaudiere Lumber Co., the Stewartton Lumber Co. and the Lumber Supply Co., all of Ottawa. The amalgamation under one business head has resulted in a very strong firm, which is forging ahead rapidly.

The personnel of the company includes men of long experience in the lumber business, who are thoroughly equipped personally to carry it on to success.

Mr. W. H. McAuliffe, president, has for years been a well-known authority on lumber conditions in the Ottawa Valley, as has also the vice-president and general manager, Mr. A. M. Davis. In D. J. O'Donohoe, secretary, and R. R. William, treasurer, the company have officers eminently fitted to fill those offices.

The McAuliffe-Davis Lumber Co. have five yards and three planing mills in Ottawa: on Duke street, a yard and mill; on Chamberlain avenue, a yard and mill, and large, up-to-date factory, and in connection with the mill a large dry kiln; a yard and mill on Herdmain road, and yards on Sussex avenue and in Ottawa East. Connected with these yards are sidings and every facility for prompt shipment. In fact, one of the features of the company's business is quick shipment. The head office is on Duke street, where the executive business of the different branches is carried on.

All the mills are operated by electricity, and have a combined capacity of 150,000 feet of dressed lumber per day. Besides these planing mills, the company control the output of three large sawmills. In rough or dressed lumber they are in a position to handle any orders, no matter how large. They specialize in dressed lumber, and do an enormous amount of dressing on orders for export from United States firms.

The MacAuliffe-Davis Co. carry heavy stocks of lumber on hand all the time, and, owing to the location of their yards, shipments can conveniently be made to any part of the country. The good quality of their stocks is already a by-word among the trade, and with the skilful management they will make rapid progress.

Mr. A. D. McRae's Views Upon the Tariff

Mr. A. D. McRae, vice-president and general manager of the Canadian Western Lumber Co., of Fraser Mills, B. C., paid a brief visit to Toronto last week, accompanied by his wife. Mr. and Mrs. McRae are on their way to London, Eng., and will spend three months in the Old Country on a holiday trip. Mr. McRae reports that the lumber trade of Western Canada at present is in excellent condition, and that the prospects for a good season's trade during 1910 are first rate.

Naturally Mr. McRae is much interested in the proposed changes in the tariff on lumber entering the United States. Speaking of the subject to the Canada Lumberman, he said the change would be welcomed by all lumbermen in Canada. The opening of the markets of the United States to Canadian lumber could not act otherwise than as a benefit to the manufacturers of lumber in Canada. The manufacturers of the west coast, for instance, will have access to the markets of the Pacific Coast States, and what that means to them can scarcely be over-estimated. The markets of San Francisco and other large consuming cities of the Southwest take large quantities of fir, which they have been securing from the mills of Washington State. In British Columbia the same timber is grown, and so far as freight rates to the markets of California are concerned, the Canadian manufacturers will have a distinct advantage. They will be able to ship to those markets in foreign bottoms, whereas the United States manufacturers, by the law of the country, are restricted to the use of American bottoms. By using foreign bottoms, Canadians can obtain a freight rate of about a dollar a thousand less than the Americans.

Just at present, said Mr. McRae, there will be no great amount of lumber shipped to the United States from British Columbia, because their markets are in a bad condition. As soon as a normal market returns, however, shipments of Canadian lumber will commence.

In the prairie markets the change should also be to our advantage, he said. When the United States producers of the middle and western States have flooded the prairie markets in the past, the Canadian manufacturers had to stand idly by and see the trade demoralized, because they could not get rid of any of their own surplus stock in the United States. Matters will be much more evenly balanced in future, and the evils of dumping low-grade lumber on the market by the United States can be counteracted to a large extent by Canadians finding a regular outlet for all classes of lumber across the line.

The reduction of the duty on shingles to 30 cents a thousand, said Mr. McRae, will be a good thing for the shingle trade in Canada. Since the duty was raised a little over a year ago, there have been too many shingles on the Canadian markets. We will now be able to sell across the line again, and the shingle men will soon get back into good shape.

W. A. Anstie, the well-known secretary of the Mountain Lumbermen's Association, has been appointed Vicegerent Snark of the Concatenated Order of Hoo-Hoo for the Mountain district of British Columbia. The appointment and the decision to create this new district of the Order was made a few days ago by the Supreme Nine in secret conclave at Index, Wash. . Previous to the decision to create a special district for the interior of British Columbia, the business of the Order was conducted from Vancouver, where the Snark, who at present is Mr. Arthur Hendry, had his headquarters. The number of members in the Mountain district has become so large, however, that is was decided to create a special district.

Noteworthy Hamilton Lumber Firm

Description of the Plant of M. Brennen and Sons Mfg. Co., Ltd., and of its Growth — Perseverance and Experience Result in Merited Success

One of the most significant developments in the lumbering industry of Canada of late years has been the appearance of instititions which not only manufacture lumber on a large scale, but, through the agency of other branches of the industry—conducted under the same general superintendence—carry on many of the other processes of manufacture and distribution which are connected with lumber in its progress from the forest to the finished product. An instructive instance of this expansion of business activity is afforded by the case of the M. Brennen and Sons Mfg. Co., Limited, of Hamilton, Ont., a company which not only conducts a wholesale business of the most successful description in lumber, lath and shingles, but, in its mills at Rainy Lake, Tioga, Huntsville and Callander, Ont., and in its retail establishment situated in the northeastern section of Hamilton, is possessed of an equipment and an organization capable of meeting every demand of those who make use of lumber in its numerous forms.

This group of industrial institutions has been developed out of a small business commenced many years ago. The progress of time has had something to do with the growth of this organization, as with all others, but it is no exaggeration to say that the most important factor has been the good judgment and innate business ability of those who have been associated with the management of the business, coupled also with that combination of perseverance and determination which are essential to the establishment of a great industrial institution. With these qualities, the members of the M. Brennen and Sons Mfg. Co., Ltd., are generously equipped by nature, and when one has been fortunate enough to visit their establishment and witness its wonderful organization, he realizes that such a growth can be the result only of these very qualities.

Personal Factors in the Company's Growth.

For the last twelve years the establishment has been under the direct management of Albert, Herbert and F. W. Brennen. These three men are the product of factors which have made so many successful Canadian business men. They have had all the advantages of a wide business experience, and to it they have added the educational advantages of an excellent university education. Herbert Brennen is the president of the M. Brennen and Sons Mfg. Co., Ltd. F. W. Brennen is president of the Canada Pine Lumber Co. Albert Brennen is secretary-treasurer of the two companies. They are also all keenly interested in everything that tends to the improvement of the lumber trade and industry. Mr. F. W. Brennen was first president of the Ontario Retail Lumbermen's Association, and secretary-treasurer of the Ontario Sash and Door Association.

Workmen's Cottages at Canada Pine Lumber Company's Plant, Rainy Lake, Ontario

The branch of the company's business which, perhaps, is best known to the lumber trade of Canada is their extensive plant in the heart of the city of Hamilton, Ont. The head office of the company is located at the corner of King William street and Ferguson avenue. There they have a splendid office building and general plant. The buildings are solidly impressive and are constructed of stone and brick. The main building of the sash and door department is a very

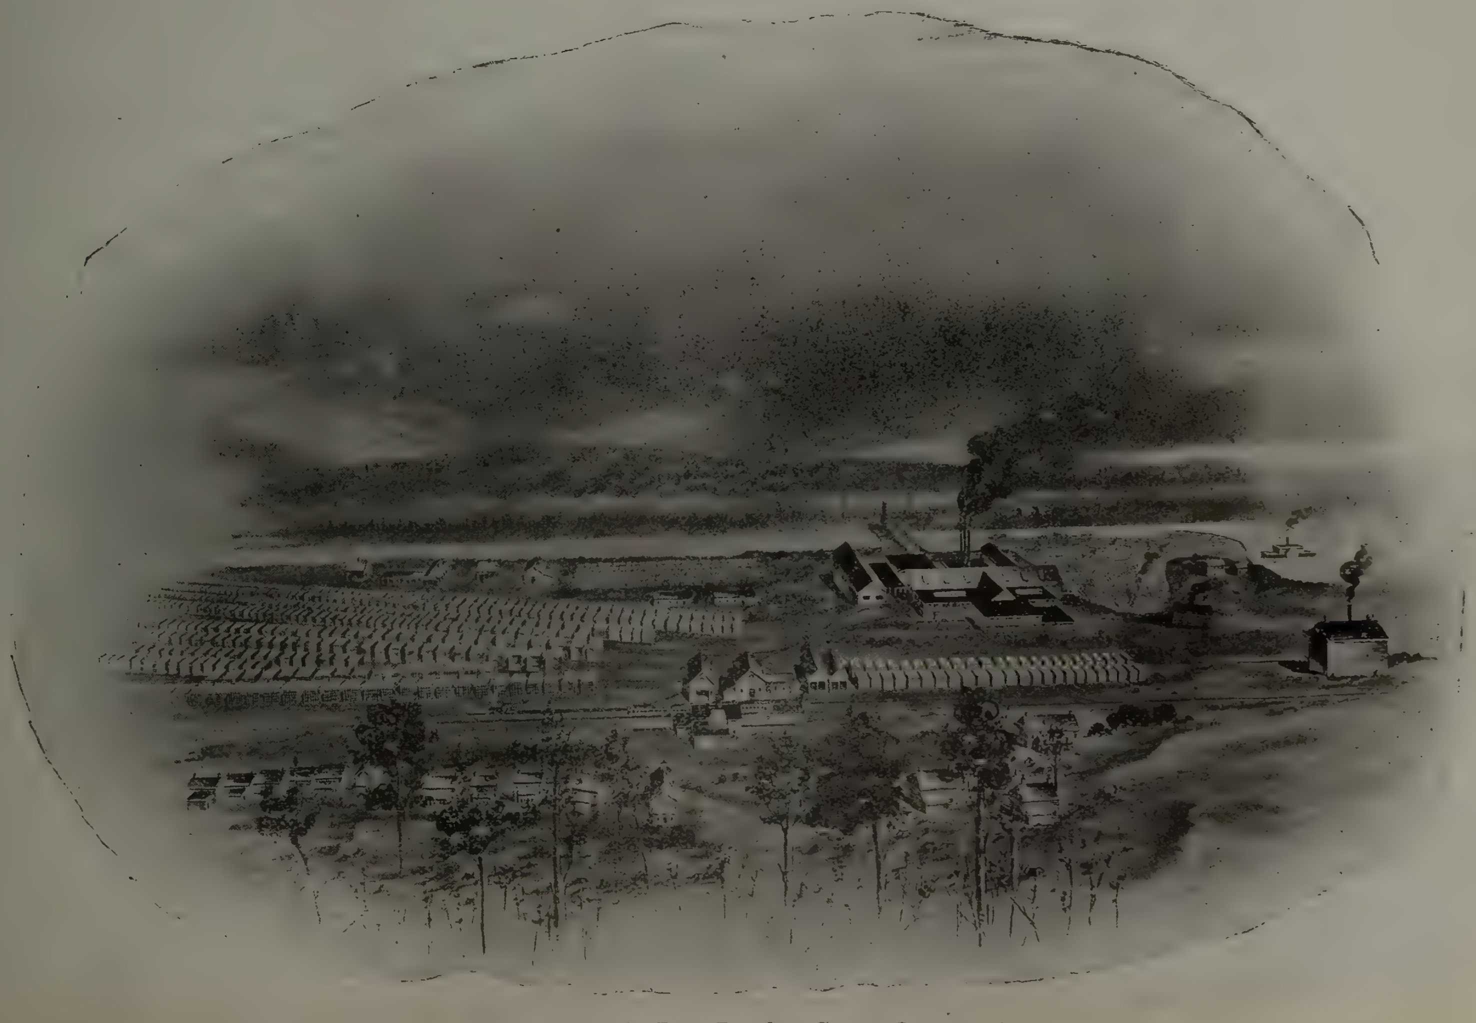
Albert S. Brennen, Secretary and Treasurer

solid two-story structure of brick and stone, 120 x 130 feet, which was built about eight years ago. This establishment, which has been growing continually since it was first instituted, is being added to from year to year, and during 1910 the company contemplate erecting a large addition to accommodate their extensive line of manufacturing.

The plant as it exists to-day is one of the most complete of its kind in America. It contains the most modern type of equipment, which includes excellent dry kilns and a large assortment of the very best types of machinery that are available in North America. Among the machines which constitute the equipment of the plant may be mentioned the following: Ballantyne stickers, S. A. Woods & Co. timber sizers, Woods matcher, Berlin Machine Co. large-size re-saw, Ballantyne inside mortiser, Chattanooga boring machine, overhead carriers for conveying timber to the big sizers, 200-h.-p. twin engines and boilers, two dry kilns, turning lathes of different kinds, all machinery necessary for sash and door manufacturing, including chain mortisers, dowel machine stickers, power mortisers, relisher, sash mortisers, dados, power-fed rip-saw, stair router, American sash plough, Berlin sander, blind slat tennant machine, jointer, band-saw and jig-saw, power clamps and shaper, and a number of other small machines that are necessary for well-equipped sash and door factories. Other companies whose machines are represented in the equipment include: J. A. Fay & Egan, Pennsylvania; H. B. Smith & Sons, New Jersey; Smith Phillips, Chicago; Greenlee Bros., Chicago; New Britain Machine Co., Connecticut, and S. J. Shimer & Co., Pennsylvania. The plant also contains machines of nearly every Canadian make, and its capacity is 100,000 feet of lumber and 500 doors daily. It will be seen, therefore, that the company are provided with every facility for the production of a large output of high-class products. It is little wonder that their business is increasing every year. In order to take care of the raw material and the product of this large plant, they



Mill and Yards of Canada Pine Lumber Co. at Rainy Lake, Ontario

Interior View of M. Brennen & Sons Plant Hamilton, Ont.

have over a thousand feet frontage of piling ground in the city of Hamilton. For the distribution of their lumber they have a large number of horses and conveyances of many varieties.

Their large assorting yard is connected with the Grand Trunk Railway, with switches on their premises, where they handle large quantities of lumber from all over North America. They have facilities for handling the largest timbers for construction, for dressing four sides at once, 20 x 34 for re-sawing any size, and for boring these timbers. For handling these large timbers in the shortest possible time, they are equipped with the latest devices, a feature which is of the greatest importance in connection with the transit trade. They carry in stock at all times a large and varied assortment of all kinds of dressed lumber, mouldings and stair material.

In the northeast section of Hamilton the company have their distributing yard. A large number of the manufacturing concerns of the city are located in this section, and the yard is an important factor in taking care of the large amount of trade which these concerns create. At this yard the company carry a great variety of lumber of all sizes suitable for the rapid industrial development of the district.

Where the Raw Material Originates.

To supply the raw material for so extensive a business it is necessary to have a lumber-producing plant of large capacity. This the company have in their several mills. Under the name of the Canada Pine Lumber Co., at Rainy Lake, Brennen P. O., Ont., the company have a thoroughly up-to-date sawmill, where they manufacture lumber, lath, shingles, shook and crating stock. This plant is supplied with power by five large boilers and three engines, of over 400 horsepower. The mill is equipped with the very latest machinery, and lighted by the company's electric light plant. Their planing mill and dry kiln produce grades of flooring that have made the company celebrated. There are 40 houses at this settlement for the employes and their families. A well-stocked general store is maintained for the accommodation of all, and there is also a fine school house. The settlement itself is one of the most picturesque sights one can find in Ontario, and it is a veritable beehive of industry and activity.

The company have very extensive standing timber holdings in this vicinity, some 100 square miles in extent, of the virgin forest. The product of this plant is shipped all over the world, and the grades of lumber produced are anxiously sought, as this quality of pine is the finest grown. The yard at Rainy Lake is a model of neatness and order, and a source of joy to all who see it. The mill has a capacity of 75,000 feet per day.

Interior View of M. Brennen & Sons Plant Hamilton, Ont.

The company also have at Rainy Lake, an alligator tug, which they use in bringing their logs down the river.

The conduct of such an extensive business demands the services of a large staff of expert employes, and it is one of the boasts of the company that they have retained in their service a number of their employes over a period of many years.

The company's customers are well acquainted with the excellent catalogue which they issue regularly. Those who have never seen this list will be the gainers if they write for a copy and obtain therefrom an idea of the variety and excellenec of the company's plant and products.

The Changes Proposed by New Tariff Arrangement

The changes included in the new tariff agreement which has just been drawn up between representatives of Canada and the United States have an important bearing upon the lumber trade. The following table shows the changes which will affect the lumber interests of Canada:

Article.	Former U.S. Duty.	Proposed Duty.
Timber, hewn, sided or squared otherwise than by sawing, and round timber used for spars or in building wharves.....	½c per cu. ft.	Free
Sawed boards, plans, deals and other lumber not further manufactured than sawed..........................	$1.25 per 1,000.	Free
Paving posts, railroad ties and telephone, trolley, electric light and telegraph poles of cedar and other woods.......	10 p.c.	Free
Wooden staves of all kinds not further manufactured than listed or jointed, and stave bolts	10 p.c.	Free
Pickets and palings....................	10 p.c.	Free
Laths	20c per 1,000.	10c per 1,000.
Shingles................................	50c per 1,000.	30c per 1,000.
Sawed boards, planks, deals and other lumber planed or finished on one side, per 1,000 feet board measure...........	$1.75 per 1,000 ft.	50c per 1,000 ft.
Planed or finished on one side and tongued and grooved, or planed or finished on two sides	$2.00 per 1,000 ft.	75c per 1,000 ft.
Planed or finished on three sides, or planed or finished on two sides and tongued and grooved, per 1,000 feet board measurement	$2.37½ per 1,000 ft.	$1.12½ per 1,000 ft.
Planed and finished on four sides, per 1,000 feet board measure................	$2.75.	$1.50.

The important item on the above list is that of sawed boards, planks, deals and other lumber not further manufactured than sawed. Under this head are included the great majority of Canada's lumber exports to the United States, which will be permitted to enter that country free of duty, when the new arrangement has been put into operation.

British Columbia Overseas Trade

As an indication of the export trade during 1910, the figures of the Hastings mill are fairly representative of conditions in general. During the year 1910, twenty vessels loaded lumber for off-shore points at this mill, as compared with twenty-three vessels during the previous year. Australia was the best customer, thirteen ships carrying cargoes thither, as compared with seven in 1909. Three vessels were sent to South Africa, two to Wales, and one to the Fiji Islands. Shipments to the Old Country fell off, only one cargo being sent thither, as compared with three in 1909. In spite of the fact that the number of cargoes was smaller than in 1909, the actual quantity of shipments shows a slight increase. The total shipments for the Hastings mill to off-shore points were 36,000,000 feet during 1910, as compared with 34,677,386 during 1909.

In an interesting review of the lumber trade of British Columbia, by Professor Judson F. Clark, it is stated that the estimated value of British Columbia's forest products during 1911 ($18,000,000) is equal to the value of the production in the State of Washington in the year 1890. During the 17 years which have intervened, the State of Washington increased its lumber output six-fold. It is argued by Professor Clark that every indication points to the probability of British Columbia at least equalling this wonderful record.

The annual meeting of the Canadian Lumbermen's Association, which is to be held in Ottawa on Feb. 7th, promises to be the best that has yet been held. A good attendance is already assured. On the evening of the same day, the third annual banquet to the association will be held at the Laurentian Club, Ottawa.

TENDERS FOR PULPWOOD LIMITS.

Tenders will be received by the undersigned up to and including the 10th day of April next, for the right to cut pulpwood on certain areas situate:

(1) On the Abitibi Lakes and River tributary to the Grand Trunk Pacific Railway, and Northern Ontario Railway, in the District of Nipissing.

(2) On Rainy Lake and around the shores of Lower Manitou Lake, tributary to Fort Frances on Rainy River, in the Districts of Rainy River and Kenora.

Tenderers shall state the amount they are prepared to pay as a bonus in addition to dues of 40 cents a cord for spruce, and 20 cents a cord for other pulpwoods, or such other rates as may from time to time be fixed by the Lieutenant-Governor-in-Council, for the right to operate a pulp and paper industry on or near the areas referred to. Such tenderers wil be required to erect mills on or near the territories and to manufacture the wood into pulp and paper in the Province of Ontario.

Parties making tenders will be required to deposit with their tender a marked cheque, payable to the Treasurer of the Province of Ontario, for ten per cent. of the amount of their tender, to be forfeited in the event of their not entering into agreement to carry out conditions, etc.

The highest or any tender not necessarily accepted.

For particulars as to description of territory, capital to be invested, etc., apply to the undersigned.

F. COCHRANE,
Minister of Lands, Forests and Mines.
Toronto, Ont., Jan. 10, 1911. 3-7

How to put Rubber Bands on Band Saw Wheels

This may appear a simple matter, but it is not always properly done, consequently loose bands are not unknown. In the first place, mount the wheel horizontally on a wooden pin screwed into a vice. Then thoroughly clean the wheel with muriatic acid, removing the old cement and all dirt and grease. When dry apply a coating of beltmakers' cement to the rim of the wheel, and put on a strip of canvas or heavy cotton cloth, making it perfectly smooth on the face.

When this is quite dry, apply a coating of cement to the canvas and a light coat to the inside of the rubber band.

Now place one side of the band on the wheel, and take a smooth taper stick and go round the wheel prising and stretching the band gradually as you go, when it should slip on to the rim. Care must be taken that the new band is sufficiently small in diameter to give a tight fit, but it should not be forced on or it may fracture. Be sure that the brand bears evenly over the surface of the rim, and that no air can penetrate, or it may become loose when in motion. When quite dry place the wheel in a lathe and dress its surface with sandpaper.

Natural Color in Wood Finishing

During the last few years furniture makers have placed on the market a large portion of their goods that have been stained and filled in such a dark color as to practically obscure the original grain and tone of the various woods. This has not only been true of oak and birch, but also of mahogany. Alleged mahogany finish in furniture, and even in house trim, has been executed in a way to absolutely "kill" all the original beauty of the wood.

It must be confessed that the grain of the lower grade furniture production has been darkened largely through economy in manufacture. It is much easier and cheaper for the furniture maker to smear wood to a dark and uniform color than it is to match up lumber and finish the furniture in light and natural tones.

Right now there is a renaissance for the finishing of furniture in approximately the natural wood coloring, and it is a desirable change that is coming about. The various woods are being filled and stained in tones just deep enough to emphasize the beauty of the grain, and the leading producers have ceased to fill the wood with disfiguring pigments.

It must be noted there is a manifest difference between staining to improve the tone of wood and coloring and staining a wood so completely as to obscure its natural color and distinction of grain. The only excuse for this excessive staining is when light woods like maple or birch are to be made into furniture to imitate mahogany or some of the darker woods, and where wood is improved by heavy staining there is no objection to it. What good taste does repudiate is the "doping" of mahogany, black walnut, Circassion walnut or oak to an extent as to absolutely disfigure the beauty of the grain. The renaissance of good taste in furniture and interior finish is much to be commended.

Green Heart Timber from Guiana

Green heart timber from British Guiana was used in the construction of the 50 large pairs of lock gates in the Manchester Ship Canal. Practically all the lock gates of the Bridgewater Canal, and for the past fifty years all the dock gates in the Mersey Harbor, have been built of that wood. It is being extensively used in the new naval docks at Methil in Scotland, and it has been specified for use as sills and fenders in the lock gates of the Panama Canal.

The durability of green heart is well known. A leading authority says that it is hard to fix a limit to the durability of lock gates built of green heart; the only element in their construction limiting their age is the iron bolts and other fastenings, which are usually renewed without serious difficulty. It is said that in rebuilding the gates of the Canada dock in 1894 it was found that the green heart, after thirty-eight years' use, was as good as at first, and it was again used in the construction of the new gates.

Every wharf in the port of Georgetown is built on green heart piles, which successfully withstand the attack of the pile worm. Teak and oak or any other hard wood would be destroyed in a few years. The immunity of green heart from the teredo is said to be due to the large quantity of the alkaloid bebeerine found only in this wood.

Review of Current Trade Conditions

Ontario.

The lumber trade in Ontario continues on the quiet but fairly satisfactory basis that it has been on since the beginning of the year. It is much too early to foretell what the spring trade will be like, but the enquiries which have come to hand so far, indicate that there will at least be no falling off. With the excellent prospects for a generally good building year throughout Canada, lumber dealers are justified in expecting that trade will be good. From the statistics published in the present issue, and from information which has been secured from manufacturers generally, it is to be expected that there will be only an average cut in the woods this winter and that there will be no surplus of any of the important stocks. With a fair demand for lumber these conditions would mean that as soon as the spring trade becomes active, fair prices will be obtainable and the trade will experience a more satisfactory season than it has had for some years. Manufacturers in the Georgian Bay district report business conditions as quite encouraging and the outlook is that most of the yards will have plenty of space in their yards for the new stock when the sawing season commences.

A recent sale of several millions of mill cull sidings by J. R. Booth, of Ottawa, is looked upon by some in the trade as a good omen. It can hardly be taken as a real indication of improvement, however, as the price, of course, is the principal moving feature in such transactions. The removal of this stock from the market, however, gives cause for satisfaction. Lath are pretty firm for this time of year. Shingles also are held at better prices, but as the west coast manufacturers are now idle, this may not be of much significance. The test of the shingle situation will betheir behaviour when the manufacturers commence sawing again. Hemlock is pretty firm and the prices are steady. Spruce is firm and unchanged.

Eastern Canada.

Trade conditions in Nova Scotia are extremely dull. The quantity of rain has been phenomenally large this winter. An almost entire lack of snow or frost has interfered seriously with logging operations. Nearly all the lakes are open and the rivers running full. If this condition continues much longer the cut will be greatly reduced. For those who are able to stand this situation, the result would not be very serious, as it would give the consumption a chance to catch up to the over-supply of the past few years. The English market is not so good as it was a short time ago, but purchases are being made at fair prices, and a satisfactory market is expected next season. Trade with the United States continues dull. Fairly decent hemlock was recently sold at $17. Lath has met with a great deal of competition in the United States markets and prices have been depressed. Enquiries regarding St. John random spruce which were recently made in New York showed that at present it would sell at only about $18.50. Prospects for better prices were not encouraging. No changes are noticeable in the South American market, shipment to which is practically over for the year. Freights during 1911 are expected to be about as low as in 1910 and cargoes are expected to be somewhat scarce. The impassable roads and lack of snow are making it difficult for the dealers, who find it almost impossible to get out their stocks for liner shipment from Halifax. One firm reports that it cannot fill its small hemlock contracts which were made for December, January shipment.

Disappointment still is the principal feature in the Boston market for spruce. Retailers have not been placing large orders and in fact improvement is not expected during the next four or five weeks. Offerings are smaller than usual but this has not helped the prices. Dealers who were holding frames at $23 are now willing to take $22.50. The demand for random has been light with prices fairly steady. Spruce covering board are selling only moderately, at prices ranging from $18.50 to $19. Very little new business is reported in hemlock at Boston. Stocks in first hands are not large and an improvement in the demand would probably strengthen the market. Eastern clipped boards are selling at $19, but random can be secured for $18 and less. The demand for shingles at Boston continues quiet. Manufacturers, however, are not forcing sales as they expect an improvement in the demand when the spring trade opens. Cedar extras are selling at $3.15 to $3.40. The demand for lath is light. 1½-inch are bringing $3.40 to $3.50 and 1⅝-inch, $3.80 to $3.90.

At New York the trade in spruce is dull and is not expected to improve materially until the beginning of March. Stocks in yards are not at all extensive. The trade in hemlock at New York is dull because of the slow building situation. Retail yards are only buying for immediate use and will not come actively into the market until spring.

Great Britain.

The c. i. f. value of spruce deals in Great Britain is reported unchanged, but there is a general impression that an advance in prices is to be expected very shortly. Shippers in fact are already asking for an increase for their parcels on consignment, but recent advices were to the effect that higher prices had not as yet been actually realized. The prices which rule at present are rather variable, according to the class of shipment and specification. Misleading figures, therefore, are very easy to quote. Contracts for forward delivery have as yet been scarce. This is taken rather as an indication of the strength of the market so far as shippers are concerned, as the prices which obtained a month ago were such that the shippers would probably have made forward contracts if they had been in a position to do so. The indications are that stocks available for shipment per liners are small and for this reason the market is likely to stiffen.

At London the deliveries from the docks during the first week of the new year were not at all unfavorable. The good movement is taken to mean that other channels of consumption, besides the building demand which is poor, are continuing fairly active. The Board of Trade and railway returns indicate that the general trade of the country is good. The tone of the lumber market is quite hopeful and favorite sizes in good condition are improving in value as stocks are none too plentiful. The London deliveries for the week ending January 7th amounted to 4,095 standards, as compared with 3,905 standards for the corresponding month of last year. At Churchill & Sim's recent auction sale 3 x 11 second regulars Montreal pine brought £21 15s. and £21. 3 x 9 dry second red pine sold at £12 15s., while unsorted ditto brought £10 5s. and £9 15s. In spruce, 3 x 11 third Quebec sold for £13. 3 x 9 ditto brought £10 5s. and £10, while 11-foot was sold at £9 15s. 13-foot fourths brought £9. 3 x 8 first ditto sold at £14 10s. and 3 x 7 at £12 15s., with fourths at £8. Planed boards were again in good demand. The floorings offered were chiefly in narrow widths and showed little variation from previous rates.

The lumber trade at Liverpool is rather dull, though apparently settling down for steady business. For this time of year the business in fact shows an increase in the consumption in some of the principal woods. The feeling all round is somewhat more optimistic than it was a year ago. In spite of this, however, importers do not entertain the same high ideas of prices as shippers of wood goods from abroad. The brokers, therefore, are not enjoying the situation very much. There is plenty of talk about the spot spruce market improving. More enquiries are being made but large orders are extremely scarce. Purchases are mostly in small lots for immediate use. Prices are about steady. They do not show any working margin for the importer and it is reasonable to expect that if the consumption increases, prices will have to advance. There are no importations of Canadian pine deals or other forms of pine at this time of year, but apparently consumers are alive to the fact that higher prices for the coming season will be in order and some of them are coming into the market now rather than wait for the future. Birch c. i. f. values are very firm, with a tendency to advance, both for log and plank. There is a good demand and stocks are being reduced rapidly. Most of the inferior wood has been disposed of. The business at Manchester has been somewhat brighter of late and enquiries are becoming more numerous. Prices generally, however, show little or no variation. At Glasgow, business has opened up again and is about normal. A fair movement in spruce is reported with firm values. The arrivals are not too numerous and an advance in prices is considered probable.

United States.

The lumber business at Chicago is reported to be improving steadily since the holiday season. Building operations are numerous and were it not for the very keen competition among retailers, business would be quite satisfactory. Good northern pine lumber is scarce, with prices firm. There is not a very heavy demand, but dealers are not concerned about this as they expect to be able to dispose of this stock later on at an advance. There has been a little firming up in box material, which has become more active. This is probably the result of a number of the manufacturers making out their contracts for the year. The hardwood trade at Chicago shows little change. Heavy enquiries are reported from all parts of the country. Stocks of plain oak at the mills are broken but prices are likely to be well maintained on account of the good trade. Woodworking factories are settling down to a steady run and are stocking up steadily. Plain oak is still well in the lead. Quartered red oak is quite active but quartered white oak is dull. A fairly large cut is expected from the northern mills. Birch is doing well and the same may be said of maple. Basswood stocks are plentiful and it is prob-

able that it will be in good demand as a substitute during the coming year. Maple is firm and maple flooring manufacturers are confident of a good year during 1911. The trade in hemlock at Chicago is dull but a fairly good season is expected. Spruce is the principal feature on the Chicago market so far as west coast woods are concerned. Railroads are making a little more enquiry for fir, but orders are still scarce. Southern pine prices have advanced from 50 to 75 cents during the last month and numerous sales are reported at these figures. Red cedar clear shingles have advanced a little and are now selling at $3.17 on Chicago basis, while stars are bringing $2.64. The demand is expected to improve in the near future. White cedars are fairly active and firm. Lath are strong. Cooperage business continues unsatisfactory and barrels are still being sold at less than cost.

At Buffalo the trade in white pine is quite as good as was expected, both the export and pattern makers' trade being good. Building operations are not calling for much stock for immediate use, the weather being unfavorable. A normal volume of business at least is looked for this year. There is not much demand for low grades and prices are low. The hardwood situation at Buffalo continues firm. Plain and quartered oak are selling well and so are the other prominent woods, particularly maple and birch. Maple flooring has been selling well. Ash is not quite so active. The quiet building trade is causing a rather dull market for hemlock. The demand for yellow pine at Buffalo is quiet. Retailers as a rule are waiting until after the convention season before giving their orders. There has been a fair demand for shingles at Buffalo when one considers the unfavorable weather. Prices are steady and show no likelihood of change. Red cedars are still in the lead.

Canadian Wood in the United Kingdom

Liverpool, Jan. 20.—The year has opened with brighter prospects for Canadian timber in the United Kingdom. The trade of the country, generally, improved greatly last year, and the settlement of the dispute in the shipbuilding industry of the northeastern building ports, in December, gave the year a more satisfactory close than otherwise it would have had. Much timber is still used in connection with shipbuilding, and the closing of the yards led to a stoppage of the consumption of timber in the industry for the time being. The lockout lasted rather more than three months, and caused a stoppage of work in industries allied with that of shipbuilding, so that, taking all in all, it was a serious matter for industry in the north and northeast of England. That, however, is past and gone, and the new year opened with the yards in the full flush of their fresh activity after the long stoppage; with much unfinished work in hand, and with new orders waiting to be carried out. A busy time is therefore assured in the shipbuilding industry.

Though frames, bulkheads and shells of new vessels are made almost entirely of steel, decks, deckhouses and fittings are still of timber, and lately a branch of fitting has opened out which has made a new and good demand for timber of kinds which Canadian exporters can well supply. Deck planks are of pitch pine or red pine, and the framing and doors of deckhouses, companionways and staircases are mostly of teak. The new branch of fitting spoken of is that of "insulating" holds, and subdividing holds with wood-built walls, in order to form rooms or chambers in which food products may be carried at low temperatures. The lining and insulating of the sides or shells of steamers, the subdividing of large holds and the insulating of the walls forming the smaller rooms, is being done generally, in the case of new steamers, and a large amount of such work has lately been done on steamers already afloat.

The work of insulating steamers in the way spoken of makes a demand for soft woods, relatively, very large, and one in which a good deal of oddment timber can be used up. To begin with, large quantities of battens, or scantling, rough from the saw, are wanted to fix to the skin, or side, of a ship, to form "wall plates," to afford a bearing for the boards which will form the "insulation" proper. Spruce or pine of any of the cheaper sorts is used for these wall plates. It may be in battens, 2½ x 1½ inches, or in scantling of 3 x 2 inches, 3 x 3 inches, or thereabouts, though a good deal of light plank wood is used, according to the conditions of the work in particular parts or places. Scantling and planks are used as uprights, extending from deck to deck, to form supports for the boards, which will serve as the walls or divisions of the different holds or chambers. A good deal of plank wood, of 6 or 7 x 3 inches, will be used, with the scantlings and battens, for the stronger constructional parts, in insulating holds and rooms of steamers of 8,000, 10,000, 12,000 or more tons, which are meant to be used for carrying meat or colonial food products. Then there is the boarding—the "lining," "wall work," or "insulation" proper, as it is variously termed. This is almost entirely of spruce boards, the boards being of almost any usable width, 5, 6 or 7 inches wide, planed by machine to finish, nominally, to ⅞ inch in thickness, and tongued and grooved.

Boards used for this new insulating work are almost invariably tongued and grooved, and are usually ⅞ inch, nominal, in thickness. In places, or for a "second sheeting," ⅝-inch boards may be used, but generally boards ⅞ inch in thickness are used.

This work, from the common plan of construction, uses up a large quantity of boards of the kind. The complete and finished insulation will be from 8 to 10 inches in thickness over all, according to the trade in which the steamer is to be engaged, and the latitudes in which she is likely to travel. A common "build" of such insulation is, to begin with the battens, then to nail a layer of ⅞-inch boards across them, and then to nail another layer of the boards at right angles with the first layer. Then, lengths of scantling or of narrow planks, 4 or 4½ inches wide, and of practically any thickness readily obtainable, would be set up, 4 or 6 feet apart, to form the main cavity for the insulating material. These upright planks would be "faced up," on their outer edges, with two more layers of the ⅞-inch tongued and grooved boards. A layer or two of a special waterproof paper would probably be laid between the layers of boards. As the building up of the boards went on, the cavity would be filled with the insulating material—silicate cotton, charcoal or granulated cork, as might be. Charcoal and cork are being used most largely for ship work. Charcoal is generally regarded as the best, as it is not affected by the damp, which is inevitable at sea, as both of the other materials are. "Flaked" charcoal, specially ground for the purpose, is regarded as most suitable, as it packs more closely in the cavities than charcoal in lump. A "build" of insulation such as that described will be 8 or 8½ inches over all. It will have four layers of the ⅞-inch spruce boards, a large use of such boards, in relation to the whole extent of the work.

Work of this kind is now being done very largely, as every new steamer which is built and which is intended to carry food products is having some of her holds insulated, on the general principle described. The demand for battens, scantling, planks and boards, which the necessity for insulating steamers has created, is a new one, and a large and important one, which will be well maintained for some years to come.

The house-building industry, which makes the most important demand for soft woods in the United Kingdom, was moderately active last year. The great improvement in trade generally, last year, and the satisfactory finish which was made in the old year, have aroused the expectation that house-building will go on more actively through the present year than last year. It may be taken as certain that it will go on at least as actively this year as last year. This will mean a good average consumption of roofing spars, of 3 x 3 inches, 3 x 2½ inches, or 3 x 2 inches, and of such heavier roof timbers as may be suited to work in hand. For inside work the chief consumption, apart from flooring joists and boards, will be of yellow pine, chiefly cut from 1¼, 1½ or 2-inch boards. Doors, window frames, sashes and shutters, cupboards and shelves are made almost entirely of yellow pine, for houses of the middle class and working class, such as will be chiefly built. Yellow pine, in fact, is used largely in fittings of the kinds named, in houses for well-to-do people, but in such cases, boards of a selected or "first quality" are more used, whereas, "second" or "third" quality of wood is used chiefly in the other cases. For such wood, one can safely predict a good demand in the United Kingdom through the present year.

A Good Outlook for Trade at Montreal

Montreal, Jan. 28.—The outlook for the paper and wood pulp trade is very encouraging. Newspaper manufacturers report their product fully sold up for a satisfactory period ahead, and while no extreme bulges in price are in evidence at present, the fair price now obtainable seems likely to be maintained throughout the year. Should dry weather follow the spring rains, and cause the power screens to remain low, thus forcing a curtailment of the output, there will be a moderate advance in price, but this would not be effective for long, for, although newspaper stocks are very low throughout the entire continent at present, there seems to be just about sufficient paper made to cover the demand.

In the case of wrapping papers, the competition among Canadian mills has been so keen throughout the past year that prices have been cut to a point which leaves very little margin, so that any change in the manilla and wrapping paper market must be upward. Mills which have accepted such low prices now desire to obtain more reasonable figures, and it is thought that this year will restore better times and methods.

In boards there appears to be an over-production, although prices are well maintained.

Book and writing papers, which have been at the top of the market in respect to demand, continue in a satisfactory position; the prospects for all the finer grades, in fact, are excellent.

In mechanical pulp, the market should be stronger in the winter, but the shipments from tide-water mills during the period of navigation will tend materially to reduce prices to United States points. Several large mills which can ship by ocean steamers sold from fifteen to twenty thousand tons and upwards during the past

St. Thomas, Ontario

season, which was delivered in New York State points by fresh-water steamers, as the market in Europe gave lower returns than on this side. The European demand for ground woods has, however, been gradually stiffening, and there will not be the same inducement to ship this pulp to fresh-water points during 1911, so far as can be determined at the present time.

The sulphite and kraft pulp markets are steady, with an upward tendency in prices.

The chemical pulp market for some years, particularly the past two, has experienced low prices, but an upward trend is now apparent, and is likely to continue until former prices are approached.

A more optimistic tone is observable in the general lumber trade, especially for high-grade stocks. According to some dealers, the demand is in excess of the visible supply, and prices are showing an upward tendency. Mill culls are low, there being practically no demand locally. Birch timber and planks are in good demand, and there is every promise for an all-round advance in the prices of the better qualities of lumber.

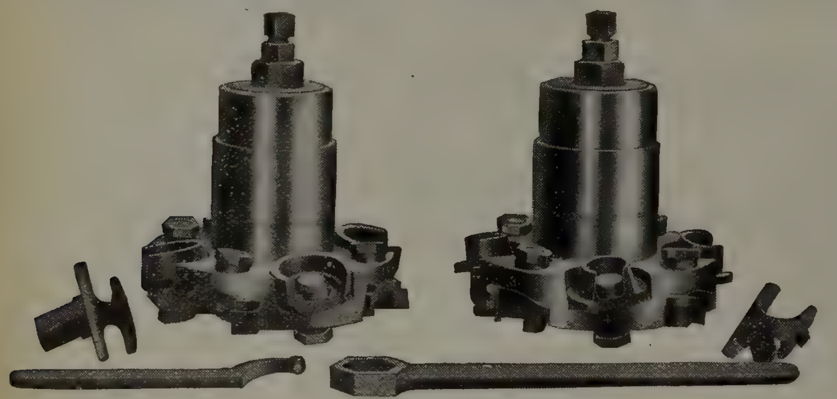
Machinery and Equipment

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

A New Cutter Head

The user of every high speed matcher is interested in the production of flooring at the lowest price consistent with good work. He feels the necessity of procuring tools and appliances that will not only do good work, but also such as will add convenience for the workmen, with genuine labor-saving advantages.

We illustrate herewith the "Shimer Limited" Cutter Head, the latest member of the large family of Cutter Heads on the market.



The "Shimer Limited" Cutter Heads

In construction this head closely resembles the regular "Up-to-Date" and "Best of All" Cutter Heads which have been standard tools for several years, but differs therefrom in the method of attaching it to the spindle; in the construction of the bit seats and of the bit designed for faster cutting; in the greater strength of the holding bolts, and especially in the self-centering device which clings to the spindle when drawn up, securing it firmly thereto.

The spindle gripping device is positive and effective in its purpose of holding fast to the spindle, as also in centering the head for a more uniform action of the cutters. This is accomplished by having the central bore of the head tapered, and having a rotatable cap and nut fitted in the upper portion. Into this bore a taper collet projects, having an upper threaded portion fitting the rotatable nut. When the top nut is drawn up the collet contracts and binds itself firmly to the spindle. This device is simple and effective and not likely to get out of order.

To match flooring at the rate of 150 to 170 lineal feet per minute the side heads must be in perfect balance and the bits must be jointed. The foregoing description shows that these heads are bound to be perfectly centered, and for the jointing the manufacturers provide a practical band jointing machine.

These heads are made either solid or with the expansion feature, as may be preferred. All cutters are preferably made of high quality tool steel, tempered to file. They hold an edge for any hard lumber for five hours and in many instances for a ten hour's run.

Further information and literature describing these tools will be sent upon application to Samuel J. Shimer & Sons, Milton, Pa.

Disstons Entertain Their Representatives

An informal banquet was given early in January by Henry Disston & Sons to representatives of the big saw and tool-making concern, who went to Philadelphia from all parts of the Union and from Canada to attend a series of trade conferences. There were present a large number of saw experts, who spend their time in lumber camps and sawing centers to aid millmen and employees in the handling of their tools. All the executive departments of the home organizations were also represented at the banquet.

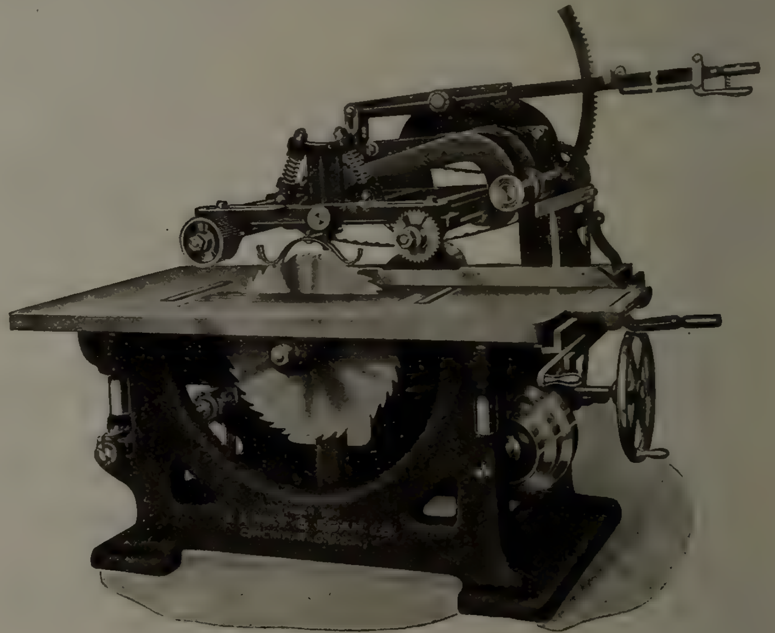
The conferences brought out the fact that it is the general sentiment of all Disston salesmen and representatives that the next twelve months will be the best selling year of their experience, despite the fact that 1910 was a record breaker. Business reports brought in from every section of the United States are optimistic, and men who are in the closest possible touch with actual conditions are confident of excellent trade for the lines they represent.

A New Self-Feed Rip Saw

The accompanying illustration shows another new machine, manufactured by J. A. Fay & Egan Co. This new machine is a Self-Feed Rip Saw, designed for general ripping, and will be found a satisfactory tool for light and heavy work.

In the manufacturer's large illustrated circular treating of this new machine, particular attention is called to the feed which consists of a power driven spur and a fluted outfeeding roll, both of which are adjustable to and from the saw to permit of handling very short, as well as long stock. The driving mechanism consists of a train of sprocket gears and chains regulated by a three step cone pulley.

The frame is cast in one piece and is free from vibration when working at its full capacity. The machine rips 4 inches thick with a 16-inch saw and 8 inches with a 24-inch blade. It takes 19 inches between saw and fence. By lowering the table and raising the feed out of the way, a timber as large as 12 inches thick can be ripped by reversing the timber. When this machine is arranged as a hand feed, it will rip 14 inches thick and take 18 inches between saw and fence.



J. A. Fay & Egan Co.'s New Self Feed Rip Saw

The table is raised and lowered by worm segments and is 37¼ inches wide by 5 feet 6 inches long. The fence is 2¼ inches high and 40 inches long and is instantly moved and clamped at any position. A graduated index is furnished for accurate ripping.

The mandrel is made of crucible steel and runs in long self-oiling bearings. The mandrel pulley has an outside bearing supported by a heavy arm bolted on to the side of the frame.

For further information concerning this machine, readers are invited by the manufacturers, J. A. Fay & Egan Co., to write for large illustrated circular. The proper address of the manufacturers is 465-485 W. Front St., Cincinnati, Ohio.

EDGINGS

Ontario

The Ontario Hydro-Electric Commission have placed an additional order for about 40 car loads of red cedar poles with the Western Lumber and Pole Company, of Denver, Colo.

M. Brennen & Sons Manufacturing Company, Limited, Hamilton, Ont., are contemplating the erection of a large addition to their sash and door plant during 1911.

The Erie Timber and Land Company, Limited, Toronto, has been incorporated, with a capital of $100,000, the incorporators are A. H. Royce and F. B. Henderson, barristers, both of Toronto.

The Twin Lake Lumber Company, Limited, Nipissing, Ont., has been incorporated, with a capital of $40,000. The incorporators are H. E. Hurlburt and E. F. Armstrong, lumbermen, both of Nipissing, Ont.

Mr. J. D. McDonald, of Owen Sound, Ont., formerly a partner in the McDonald-Rowland Lumber Company, has registered and commenced a lumber business under the name of "The Lad From Glengarry Lumber Company," of Owen Sound.

Since the passing of a by-law by the town of Fort Frances, Ont., granting special privileges to the Shevlin-Clark Company, work has been commenced upon the erection of the company's mill. The capacity of the mill will be over 60,000,000 feet per annum. A planing mill will also be erected, and the company will employ 400 men.

The mills of the Howard Cooperage and Lumber Company, Ridgetown, Ont., will soon be running again after being closed down for the past two years. Thomas Johnston has taken over the enterprise and has associated with him the Leitch brothers, who started the mills about fifteen years ago. They will handle lumber, baskets, veneer and fish boxes extensively.

E. R. C. Clarkson, of Toronto, the liquidator appointed by the court to wind up the business of the Sturgeon Falls Pulp & Sulphite Mills, states that requests for options on the property have all been declined and that it will be sold by auction early in April. Among several applicants for options were W. R. Hearst, of New York, and two Chicago syndicates. The mills have an estimated value of $1,250,000, and the company has concessions from the Ontario Government to cut pulp on a territory of 2,750 square miles, north of Lake Nipissing that is estimated to contain 13,500,000 cords of pulpwood.

Work will soon be commenced on a new manufacturing plant to be manufacture of doors, boxes, egg crates and other classes of wood-work. erected at Sarnia, Ont., by H. Diver. The new industry will be for the The plant will be erected on Nelson street in the north ward, on land acquired from the Cleveland-Sarnia Saw Mills Company. The main building will be two stories in height and will be 80 by 200 feet of reinforced concrete. There will be a storage building of 20 by 200 feet; dry kilns of 60 by 60 feet, and a building for the steam power plant of 40 by 80 feet. It is expected that the new plant will be in operation in the early spring.

The organization meeting of the Great Lakes Lumber Company, Limited, was held recently at the head office of the company, new Kilbourn Block, Owen Sound, Ont. The following officials and directors were appointed: President and general manager, W. A. Rowland, formerly of McDonald-Rowland Lumber Company; vice-president, H. E. Rowland, president and general manager of Owen Sound Lumber Company, Limited; secretary-treasurer, Ed. J. Dedrich; directors, Hon. A. G. MacKay, K.C., M.P.P.; William Taylor, president and general manager Taylor & Pringle Company, Limited; W. H. Merritt, managing director National Table Company, Limited.

Eastern Canada

The Eastern Paper Company, St. Basile, Que., has been incorporated, with a capital of $100,000. The incorporators are E. R. Pepin and J. O. Collette, of St. Basile.

The Louise Lumber Company, Megantic, Que., has been incorporated, with a capital of $20,000. The incorporators are T. M. Craig, lumber dealer, Sherbrooks, Que., L. Bolduc, lumber merchant, and E. Huard, Megantic, Que.

The Maritime Lumber Company, with an authorized capital of half a million dollars, and St. John, N.B., as the chief place of business, has been granted a Dominion charter. Among the incorporators are T. A. Linton and W. C. Jordan.

The St. Maurice Industrial Company are completing plans for large extensions to their pulp and paper mills at La Tuque, Que. It is stated that the new plant will cost in the neighborhood of one million dollars and will be devoted largely to the manufacture of news paper.

The plans of Price Brothers, Quebec, include the erection of new pulp and paper mills at Riviere aux Sables with the opening of spring. About 14,000 h.p. will be developed and a village established to accommodate in the neighborhood of 4,000 people. The mill will have a capacity of 150 tons of paper per day. Riviere aux Sables is about ten miles north of Chicoutimi in the district of Saguenay. The company state that there is no truth in the report that they are securing sites for the erection of mills in the pulpwood country north of the St. Lawrence River in Quebec.

A Montreal despatch says: One of the biggest financial propositions, in which Montrealers are interested, will be consummated when a charter is granted to the Quebec Pulp and Paper Company, Limited, of Montreal, with a capital of $15,000,000. The necessary papers have been sent to the Secretary of State at Ottawa. The intention of the company is to purchase a number of running concerns and options have already been secured which will give the Quebec Pulp and Paper Company an output of great proportion within a few months. It is possible that the names of the companies absorbed will not be changed, but that the Quebec Pulp and Paper Company will simply become a holding company. The money comes from both English and French capitalists in Montreal. It is understood that Mr. R. Forget, M.P., has a big share, and that Mr. J. N. Greenshields, K.C., is heavily interested.

Fire completely destroyed the pulp and saw mills of the Campbell Lumber Company, on the night of January 22, and as a result the three hundred men employed at the mills are idle. The loss will be over $50,000. The fire was discovered shortly after eight o'clock, but as the mills are isolated, being situated about three miles up the river from Weymouth, very little assistance was available until the fire had gained such headway that it could not be checked. In addition to the plant being destroyed, all the machinery with the exception of the flume turbines and six grinders were rendered worthless, the turbines and grinders being saved by the fact that there was water in the flumes. The origin of the fire is a mystery. Last fall over $15,000 worth of new machinery was installed. The total insurance on the buildings and plant was $38,000. The plant destroyed was capable of producing over thirty tons of pulp a day, and will probably be rebuilt at an early date. When the buildings are rebuilt the new ones will be of concrete, and will be thoroughly fireproof.

Western Canada

The British Canadian Lumber Corporation, Limited, Montreal, has been incorporated, with a capital of $20,000, the incorporators are R. H. Chrysler and C. J. R. Bethune, solicitors, of Ottawa.

The British Columbia Gazette gives notice of the following incorporations: The Cranbrook Sawmill Company, Limited, capital, $50,000; Iowa Lumber and Timber Company, capital, $250,000; Island Lumber Company, Limited, capital, $100,000.

The second lumber company within a week to purchase property in Lethbridge, Alta., with the object of opening up a yard in the city is the Farmers' Lumber Company. The company has purchased a half block and has commenced to erect office buildings and lumber sheds.

The British Columbia Gazette gives notice of the incorporation of the following companies: The Realty Fruit and Lumber Company, Limited, capital, $500,000; Island Lumber Company, Limited, capital, $100,000; The Wolverine Lumber Company, Limited, capital, $75,000; The Granite Creek Lumbermen, Limited, capital, $65,000.

The British Columbia Gazette gives notice of the incorporation of the following companies: The Cranbrook Sawmill Company, Limited, capital, $50,000; Iowa Lumber and Timber Company, Limited, capital, $250,000; The Interior Lumber Company, Limited, capital, $20,000, to carry on business as timber merchants, sawmill and shingle-mill proprietors; Oliver Scrim Lumber Company, Limited, capital, $100,000; The Granite Creek Lumbermen, Limited, capital, $65,000; The Wolverine Lumber Company, Limited, capital, $75,000.

The machinery for the Powell River Paper Company has reached Powell River, B.C., and is being installed. The company expects to be in shape to commence operations in May. When completed the plant will employ from 1,250 to 1,500 men. The mill is to have a capacity of 100 tons of news print and 135 tons of wood pulp per day. Contracts for the output of the mill have been made for a long time ahead, and 25 per cent. of it will be taken by the domestic markets. The balance will be sold in the United States. The ground wood and chemical pulp will be sold to foreign paper manufacturers for making expensive grades of paper. The company has a water power capable of developing 65,000 horse power. It also owns 212 square miles of pulp wood limits.

Mr. G. H. Robertson, of Victoria, B.C., who is interested in standing timber with his brothers in Victoria, under the name of the Western Finance Company, Limited, and Robertson Brothers, spent the last three months in London interesting British capital in British Columbia timber. He had for sale 200,000 acres of timber for which British investors are to pay two millions. Representatives of English companies are now visiting the district. The timber limits are situated along the West Coast of Vancouver Island, in the Quatsino, Nootka, Clayoquot and Nitinat Lake districts. The timber on the area in question is principally composed of cedar and fir with some hemlock, and a sparce scattering of spruce. The limits have been estimated to contain in varying proportions from 20,000 to 30,000 feet to the acre.

Trade Enquiries

The Dominion Government Trade and Commerce reports contain the following trade enquiries. Readers of the Canada Lumberman may obtain the names of enquirers by writing us, enclosing stamped envelope, and stating number of enquiry.

43. **Pine.**—A Manchester firm desires to correspond with Canadian exporters of British Columbia pine.

45. **Shovel handles.**—A Manchester firm asks for prices of shovel handles from Canadian manufacturers.

52. **Oak spokes.**—A Manchester firm asks for prices and dimensions of oak spokes from Canadian manufacturers.

53. **Pick and shovel handles.**—A Manchester firm asks for prices, all sizes of pick and shovel handles, from Canadian manufacturers.

54. **Broom handles.**—A Manchester firm wishes to obtain prices of broom handles, all sizes, from Canadian manufacturers.

58. **Box boards.**—A Manchester firm wishes to correspond with Canadian manufacturers of box boards.

"The New Arrival at the Inn," is the title of the colored picture which has been selected by the Digby Lumber Company, Limited, of Lindsay, Ont., for the decoration of their calendar for 1911. The picture is a reproduction of a painting by the well-known artist, the late W. Verplanck Birney, A.N.A. This was the last of Mr. Birney's great National Academy pictures and is admitted to represent him at the height of his power. The Calendar is of generous proportions and will be gladly welcomed by those who are fortunate to be numbered among the company's friends.

DOUGLAS'
TRADE MARK
REGISTERED
EGYPTIAN
LINIMENT.

DOUGLAS & COMPANY, NAPANEE, ONT. CAN.
SOLE PROPRIETORS MANUFACTURERS AND EXPORTERS

Will Stop Bleeding at once.
It Removes Proud Flesh and all Inflammation, and Cauterizes the Wound.

Badly Calked Horse Saved by timely use of this Liniment

The season of icy roads and sudden heavy snowfalls is an anxious one for horse-owners, because it is so easy for a sharp-shod horse to cut himself seriously when floundering in the deep snow.

A bottle of Douglas' Egyptian Liniment on hand then, may be the means of saving a valuable animal for you. It not only stops the bleeding at once, but keeps the wound clean and healthy and quickly heals it.

Read what Mr. G. P. Ashbocker, Evan Mills, N.Y., says about it.

"Egyptian Liniment has made extraordinary cures for me. One of my horses got badly calked and everyone said he would have the lockjaw The wound gathered and broke, and there was a great hole between the hair and the hoof. I used only Egyptian Liniment and the horse's foot was soon sound and well. It made a permanent cure. In my estimation there is nothing equal of this Liniment for cuts or sores of any kind."

SURE CURE FOR THRUSH

Worst Cases Yield to Douglas' Egyptian Liniment

Mr. J. L. Boves, secretary of the Napanee Driving Park Association, has had a good deal of experience with thrush on horses' feet and has tried various remedies. He writes:

"I have cured bad cases of diseased feet or thrush on horses with Egyptian Liniment with two or three applications, after calomel, salt, coal oil etc., had completely failed to do the work. I consider it a waste of time to use anything but Egyptian Liniment for thrush."

Such an emphatic statement from an experienced horseman speaks volumes for Douglas' Egyptian Liniment.

Twenty-five cents at all Druggists. Free sample on request. **DOUGLAS & CO., Napanee, Ont.**

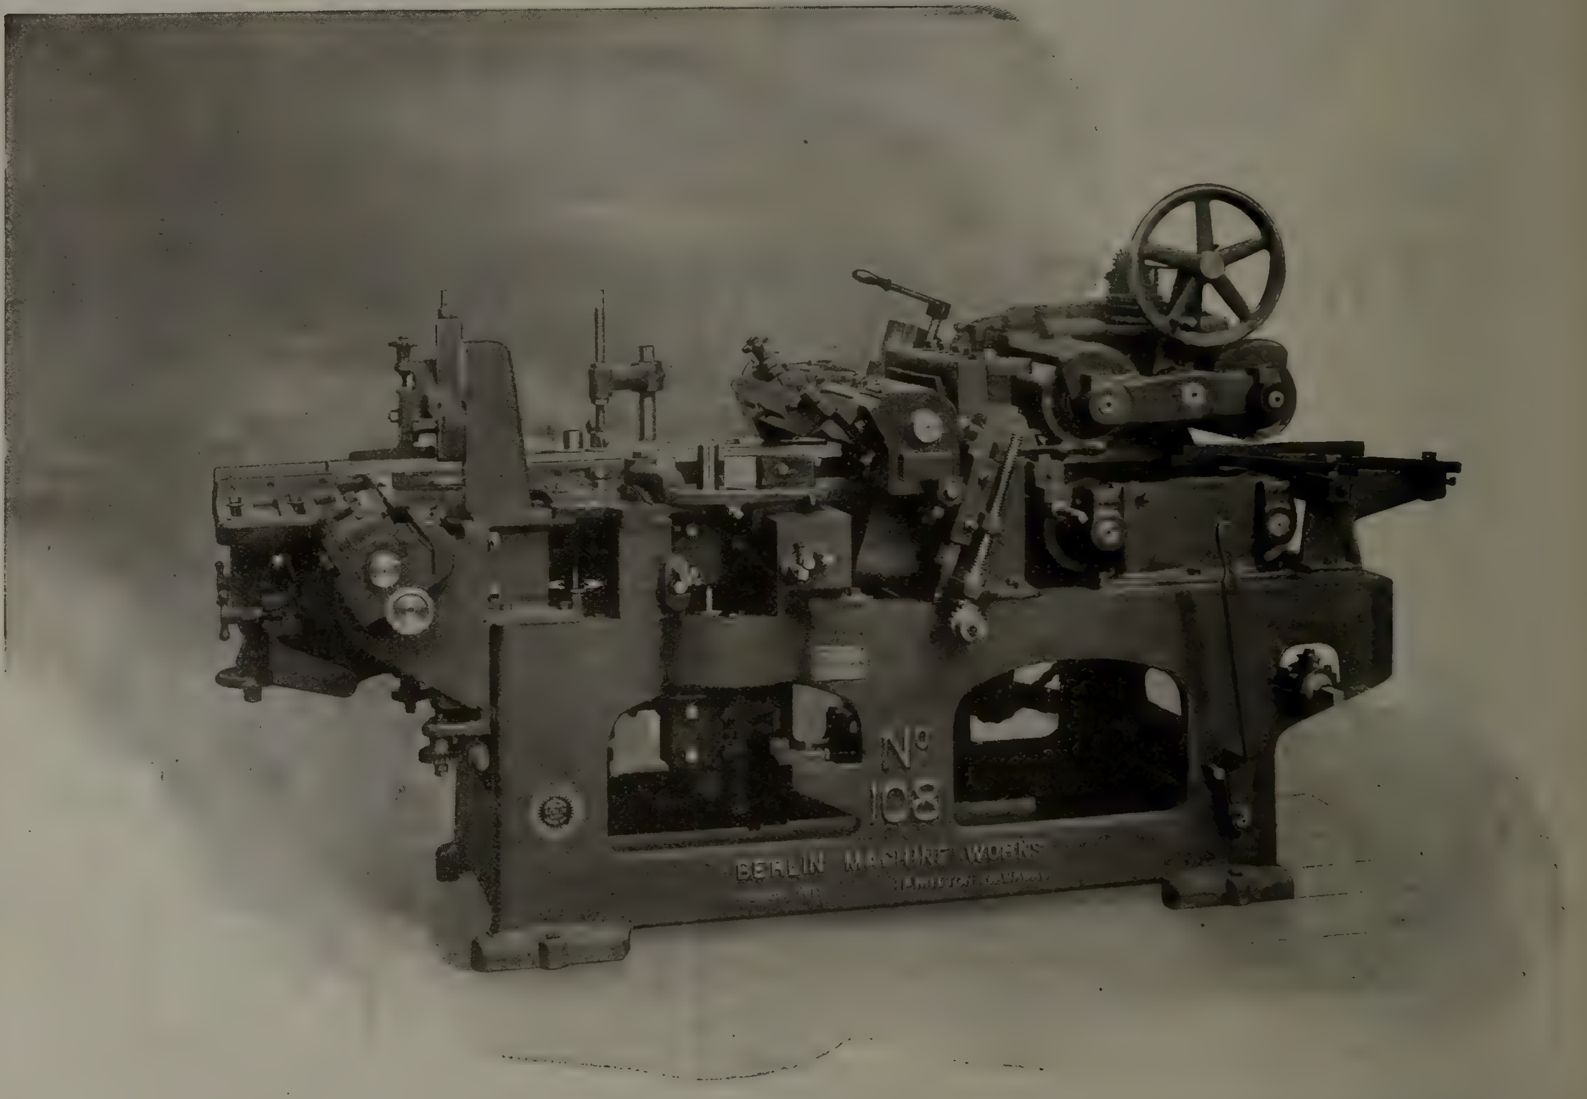
"The

BERLIN 108 OPEN



No 108
BERLIN MACHINE WORKS

Berlin Machine

Hamilton

Original"

SIDE MOULDER

The No. 108 is not an inside moulder nor an outside moulder. It is a combination of the good features of both these types. From the inside moulder we have used the solid bed, the powerful feed works, and the rigid cylinders. From the outside moulder we have used those desirable features of accessibility.

The No. 108 is a heavy substantial machine built on a rigid one-piece frame which forms a very solid foundation for the working parts. There is no overhanging machinery, for the working parts are all built directly over the frame. This one feature goes a long way toward making it the most substantial moulder built.

The No. 108 has other features which you will appreciate. Glance at the picture and note the large powerful feed works, the rigid mounting of the cylinders and side head spindles, and the long adjustable wooden shoe which bears firmly on the stock all the way through the machine.

Then there are features of accessibility which can not all be seen in the picture but you will appreciate these when we tell you. The knives are easy to get at when you want to alter or sharpen them. All adjustments are made from the front side of the machine.

But, here is the point which is most significant in the value of the No. 108. It is the product, obtained by expert designers who have been over the moulder proposition from A to Z and back again a great many times. In this moulder are contained the latest improvements known to modern wood working machinery construction.

To you these fine mechanical points are of little interest but, you who are daily using wood working tools appreciate most keenly how much profit there is to be obtained from a good moulder.

45 108's sold and shipped last year. Why? Because one man bought, others learned what he was doing with it and bought too.

If Berlin Tools are a "dollars and cents" proposition in his business why not in yours?

Before you decide on a moulder, we would like to explain the No. 108 to you. We are sure you will then appreciate what we mean by the term "Original Open Side Moulder."

Works, Limited,

Book-keeping Without Books!

Abolish the day book, the journal and ledger—and make a salesman out of your book-keeper.

For, if there is one place in your business where you are losing money, it is in the endless posting from sales slips to one book after another.

You are losing money in extra book-keeping—in the wages of a book-keeper—in expensive mistakes—and in costly misunderstandings with customers.

You are losing money in hundreds of ways, due to carelessness and forgetfulness, that cannot exist with a McCaskey Gravity Account Register in your store.

Just so long as you sell on credit, for cash or on approval—pay money out or receive money on account—you can be sure of an accurate record only by using

Only One Writing

The McCASKEY SYSTEM

"First and Still the Best"

With one writing, the McCaskey Gravity Account Register will handle every detail of your business from the time the goods are bought until the money for them is in the bank.

It automatically limits credit and flags the merchant at every danger point.

Your customers get a copy of each and every purchase at the time it is made. This copy shows the date, the clerk that sold the goods, the items comprising the same, the amount, the balance brought forward, *and the grand total due by the customer down to the minute.*

There is no chance for dispute.

The "McCaskey" is an automatic book-keeper that makes no mistakes, displeases no customers, has no temptations.

It is ready for business any minute of the day, never late for work—*and draws no salary.*

The McCaskey Gravity Account Register is admirably adapted to the needs of the dealer with 50 or the merchant with thousands of accounts.

It is equally satisfactory to the Lumberman, or dealer in **camp supplies**, grocer, butcher or baker—drygoods, hardware or drug store—as well as merchant, manufacturer or professional man in any line of business.

Learn about the "McCaskey" to-day. You needn't wait for the "other fellow" to try it out.

Over 60,000 merchants, storekeepers, manufacturers and professional men have proved the "McCaskey" a money-saver and a money-maker.

MULTIPLY YOUR SALES

By giving patrons Better Work—Neater Work—Standard work—work that fits with that made a year or more ago.

The SHIMER CUTTER HEADS are the only tools that make this possible at a reduced cost and with an increased output, besides putting a finishing touch to your work that will favorably advertise your mill and facilities.

Shimer "Quality" and "Quantity" will be found a big help when you are fighting competition. A finer quality of flooring means better prices—the increased quantity a saving in the cost of production.

Be choice about your Cutter Heads because their worth is based on what they will do and how long they will last. Many Cutter Heads are carelessly made, of material that is not intended for high running speeds; sometimes they are out of balance, frequently they break or wear out entirely before their users have had reasonable service.

Feeds are faster, strains, wear and tear are greater to-day than ever before, because the hardest woods are being manufactured into flooring and other products. The Shimer Cutter Heads have been keeping pace with the growing needs and are made of Steel Forgings for strength, designed for durability, with labor and lumber-saving propensities.

Look for the NAME and TRADE MARK **"The Shimer Cutter Head"** stamped on every head we turn out. A dealer who would sell you an imitation means to deceive you—send them back and demand the genuine article with our guarantee for your protection.

New Simonds Steel Mill

A Complete New Steel Mill for Simonds Saws has been built and is now in operation near Niagara Falls

Simonds Saw orders for the spring of 1911 will not be delayed in the least because of any lack of steel. The new mill settles that question.

Simonds Saws made from Simonds Steel are now up to the highest known standard of material in the steel from which they are constructed. The Lockport mill is to make this special grade of saw steel almost exclusively, and it is only for use in the manufacture of Simonds Saws.

"Go find a suitable location and build an entirely new Simonds Steel plant," was the startling suggestion offered by a director of the Simonds Manufacturing Company when the subject of "service" was being discussed in a meeting, one day last spring.

Simonds Saws were selling faster than they could be made and delivered satisfactorily. The trouble was with the amount of steel being made by the original mill. The three factories Fitchburg, Mass., Chicago, Ill., and Montreal, Que., could make the goods all right, but they couldn't get enough of our own high grade crucible steel, which is the only kind that will be put in Simonds Saws.

The problem had to be met. The suggestion of the director proved the best solution. Plans were at once made for a new mill. Lockport, N.Y., was selected as the location. Work of construction began early in the summer. The first steel was rolled Monday, January 2nd, 1911.

Briefly, that is the story of one of the biggest tasks ever accomplished by a Saw manufacturer. A more detailed account would tell of the months of strenuous work, getting men and materials on the grounds at Lockport; inspecting and passing the materials purchased for construction; and the constant pushing of construction work. To-day the buildings are up as planned, the machinery is installed, and everything is being rounded out in the most convenient shape.

The accompanying illustration gives a view of the outside of the Simonds Steel Mill. Fourteen acres of land are covered by the buildings and immediate yards; and in all there are eighty acres of land here belonging to the Simonds Company.

All raw material is brought right into the mill by the private switch tracks of the Simonds Company.

At the crucible furnaces each crucible is prepared for the melting by being carefully filled with just the right ingredients. The mixture is made according to definite formulas obtained from the chemical laboratory, where records and results of all previous mixtures have been carefully kept for the past fourteen years. The special saw steel properties which Simonds Steel possesses is primarily the result of using, in the first place, the right mixture for Steel making. Our principal reason for embarking in the steel business eleven years ago was on account of our not being able to buy from existing mills a uniform steel with a guaranteed mixture made to our specifications.

Different chemicals melted in the crucible with the iron give to the steel formed very different properties —thus does Simonds Steel get its individuality. Thus it is made according to a secret formula that is not elsewhere duplicated. A considerable proportion of the iron used is the famous Dannemora iron imported direct from Sweden, on which there is a high duty. Nothing that bears the name of "Simonds" has ever been made from anything but the very best of materials and in a crucible furnace.

Uniformity—uniformly good—is our constant watchword. To make sure of this desired uniformity, careful chemical analysis is made on every heat turned out of the mill. The physical properties of the steel are also tested out. We know of no other steel mill in the United States that is so thorough as the Simonds Lockport mill in the testing of steel.

The Lockport mill is equipped with a series of rolls for each kind of saw blades. Simonds patented tempering process is a part of the work of the saw factories.

The machinery of the Lockport mill is thoroughly modern. All that is latest and most up to date in scientific crucible steel making is made use of here. New machinery and new methods enable us at once to double our former steel production. The mill is entirely electrically equipped, each machine being supplied with individual motor drive. Electric current is brought on high voltage wires direct from generators at Niagara Falls.

When the difficulties of making Saw Steel are fully realized it will at once be seen why we do not go into the open market and buy any old steel for the making of Simonds Saws. It cannot be done, at least not to our satisfaction, and our satisfaction never stops short of a Saw that will satisfy the most exacting saw mill man. So, making our own Simmonds Steel is a necessity to maintain the quality which has put and will keep Simonds Band, Circular, Cross-Cut and Hand Saws in the leading position which they now occupy.

The increase of our steel-making ability which the new Lockport mill brings to us is an excellent investment, the benefits of which will be enjoyed wherever Carpenters use Hand Saws or Mill and Lumber men use Mill Saws.

HIGH GRADE—THE DIAMOND LINE—RIGHT PRICES

Diamond Shanty Steel Range

SIX HOLES

Length of fire box for wood 28 in. Size of oven 24x27x15. Elevated reservoir as cut or flush reservoir.

Made of extra heavy steel closely rivetted. Malleable oven door frames.

Used by a great many of the leading lumbermen in Canada. Would be used by all if the good points were known by all.

Lumbermen's Heaters

IN THREE SIZES 36, 42 and 48 inches long

Strong and durable. Right Quality. Right Prices.

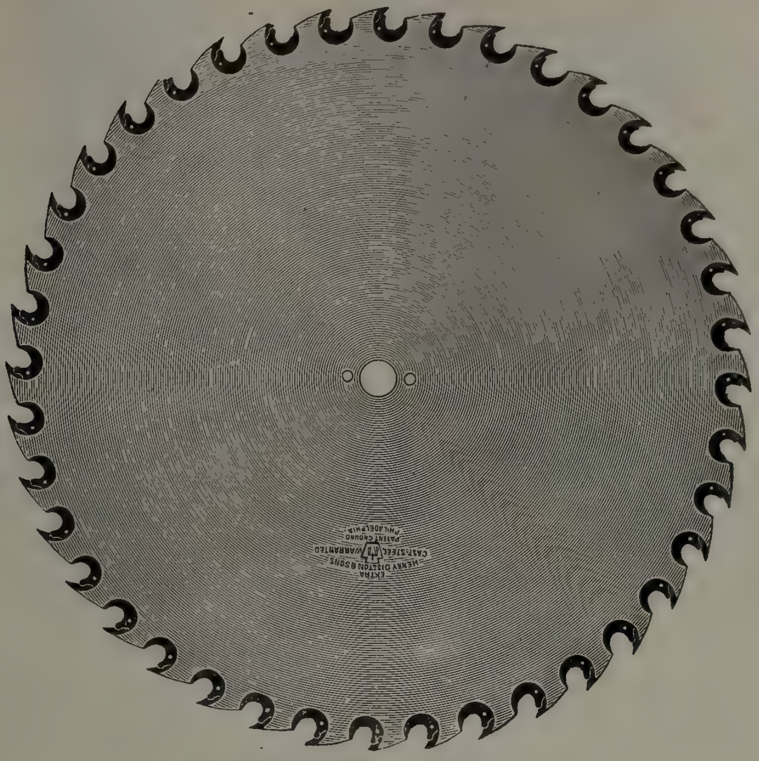
For Over Seventy-one Years

Disston Saws have remained the BEST



DISSTON CHISEL TOOTH-SAW

Disston Saws have remained the BEST

Why Disston Saws are the Best

While DISSTON Crucible Steel is almost enough in itself to make the finest saws, something more than that goes into DISSTON SAWS. To our own seventy-one years' practical experience and scientific research is added **the experience of the most skilful sawyers and lumbermen in the world.**

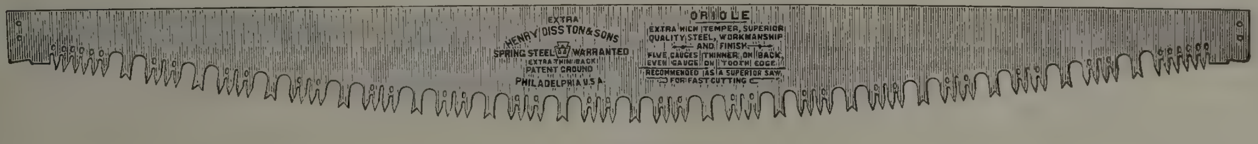
The natural result is—DISSTON SAWS do the greatest amount of work in a given time, with the least labor and operating expense.

The Disston Chisel Point Saw is one of the products of the experience referred to and combines perfection in design, material and workmanship.

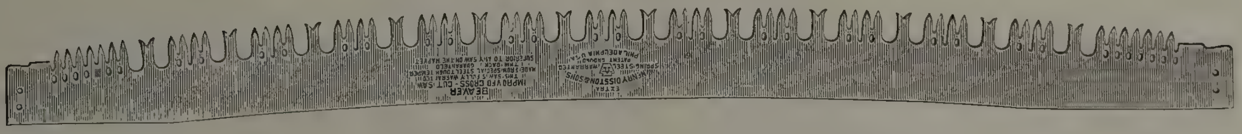
POINTS.

The Saw always remains the same diameter. Never requires gumming. "Points" or Bits are absolutely interchangeable, can be changed in a few minutes. After each insertion of new Points saw is practically good as new. Unnecessary to joint, side-dress or sharpen new points before starting work. Shanks or Holders fit the sockets perfectly. Will cut all kinds of timber—frozen or otherwise. Consumes less power. Ample throat-room and clearance—cannot be choked down. Will carry more feed than any other inserted tooth saw made. Guaranteed to stand up to any given speed.

ORIOLA



BEAVER



Both these saws—"ORIOLE" and "BEAVER" are tempered as only the DISSTONS have been able to temper saws; THE PROCESS IS EXCLUSIVELY OUR PROPERTY. There is no other known way for getting the superior edge and set-holding qualities of cross-cut saws.

They cut clean. The teeth hold their edge and set under conditions which would conquer saws made of a different steel or by any other process.

They are ground on lines which conform exactly to the breast of the saw. The blade is left perfectly uniform in thickness throughout the entire length of cutting-edge. Being tapered, also, to an extra thin-back, these crosscut saws have the maximum amount of clearance without any sacrifice of the necessary elasticity and stiffness.

The Disston reputation for Seventy-one years makes the following assertion worth its face value—**We guarantee Disston Saws to run easier, cut faster and last longer than saws not made by DISSTON.**

FREE—A request, even on a postal, will bring our latest catalogue. It describes not only the saws named above, but many other styles, together with the various tools every saw user needs.

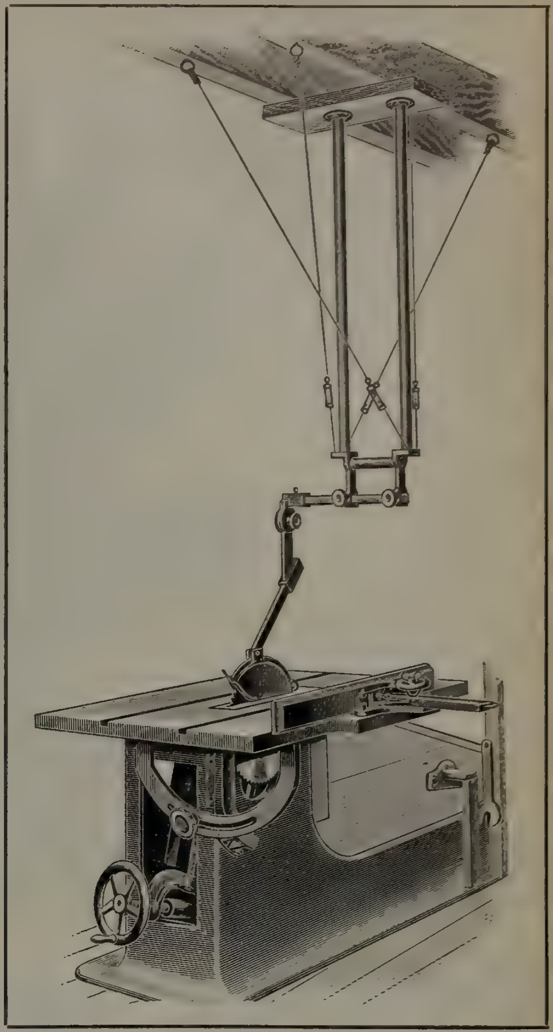
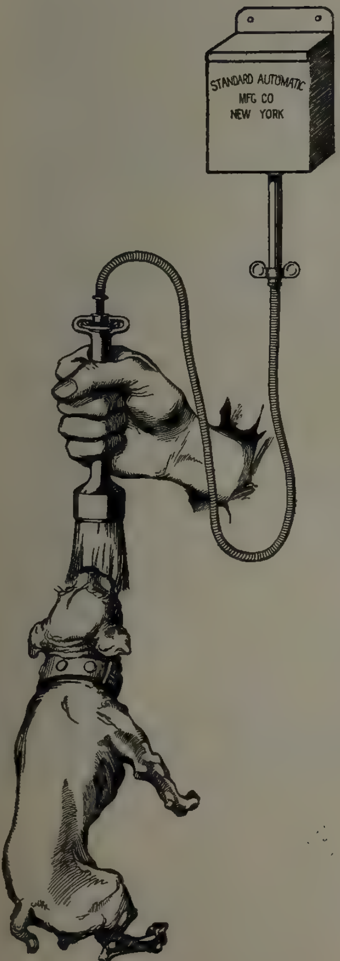
JONES
Safety Device Co.
Hamilton, Canada





THE

Standard Automatic Brush

does your painting work in a new way, better, quicker, cheaper, eliminating all waste of paint. An equal flow at all times; thickness of coat can be accurately adjusted. Absolutely clean and fireproof.

THE STANDARD AUTOMATIC SYSTEM

does away with the paint can. It eliminates the dip and is far superior to the spray, but it does rub it in. No air pressure is needed. Will work with any kind of paint. Get next to this method. Made especially for manufacturers of automobiles, automobile bodies and wheels, all kinds of vehicles, carriages, etc. It is most useful for manufacturers of furniture. It will also save a lot of time in painting structural work, such as bridges, elevated roads, etc. House and sign painting can be done effectively and quick.

Wherever duplication of work exists, this device will increase your output and reduce the cost. Buy just one outfit to-day and be convinced. We are sure that we will have to equip your entire plant. Special equipments can be made to suit your purpose.

Complete outfit consisting of a large paint tank, either stationary or movable, with automatic valve and six feet of flexible tubing together with the automatic adjustable brush made of aluminum, costs $7.50, and it is still cheaper than the ordinary brush.

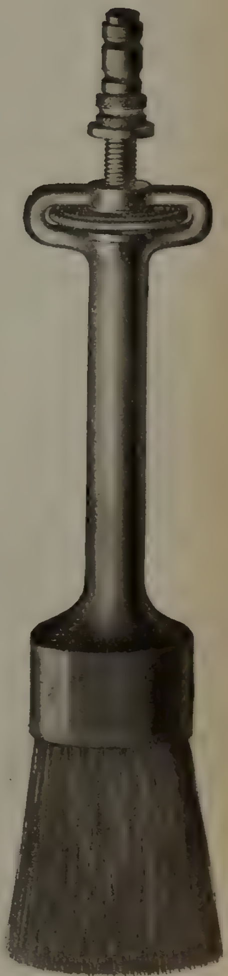
The outfit is also made with a tank to be strapped on the back which will cost $2.50 extra.

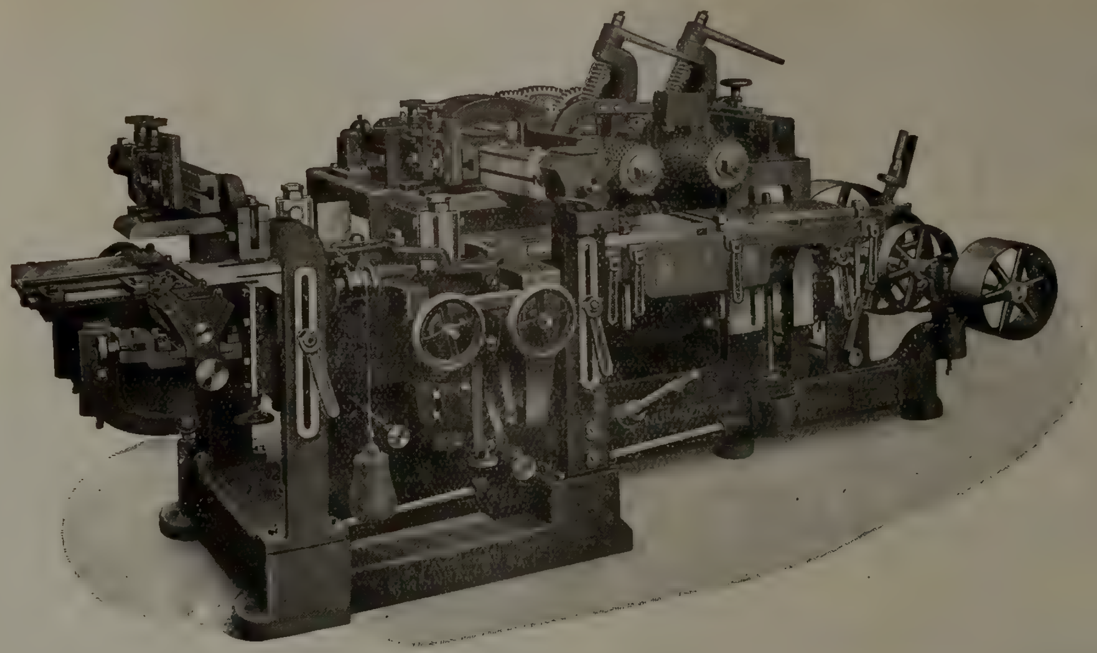
Our booklet will tell you why. Write for one to-day. Send in your order. Your outlay will only be once. Apparatus will last a life-time. Let us know to day what you are manufacturing and we will effect a saving for you.

Jobbers and Dealers wanted everywhere.

Standard Automatic Manufacturing Co.

50 Church Street NEW YORK





No. 184 Four-Side Molder.

Notice the extension of the base, forming an outside bearing for the upper head and eliminating overhang of the lower head.

Molder-Value is Measured by the Quality and Quantity of Output

The best results can only be attained by using the best Molder the Market affords—a Molder that is as near perfect as human ingenuity can make it—a Molder that has stood the test.

We have been building Molders for eighty years—you have the reputation and guarantee of the world's largest manufacturers of high duty woodworking machinery back of the assertion that the latest models of Fay & Egan Molders are in advance of any other make now on the market. You also have the verdict of the most discriminating buyers, such as the Otis Elevator Co., Pullman Co., Illinois Central Ry., Sante Fe System, International Harvester Co. and many others, who have bought and still continue to buy our Molders in preference over all others.

LASTLY—our Molder catalog goes into the details of our complete line of high duty Molders—showing that our machines have all the points claimed by other manufacturers, many features exclusive in our machine and that built-in quality that is absolutely necessary in making a good Molder. This catalog gladly mailed free of charge upon receipt of your request.

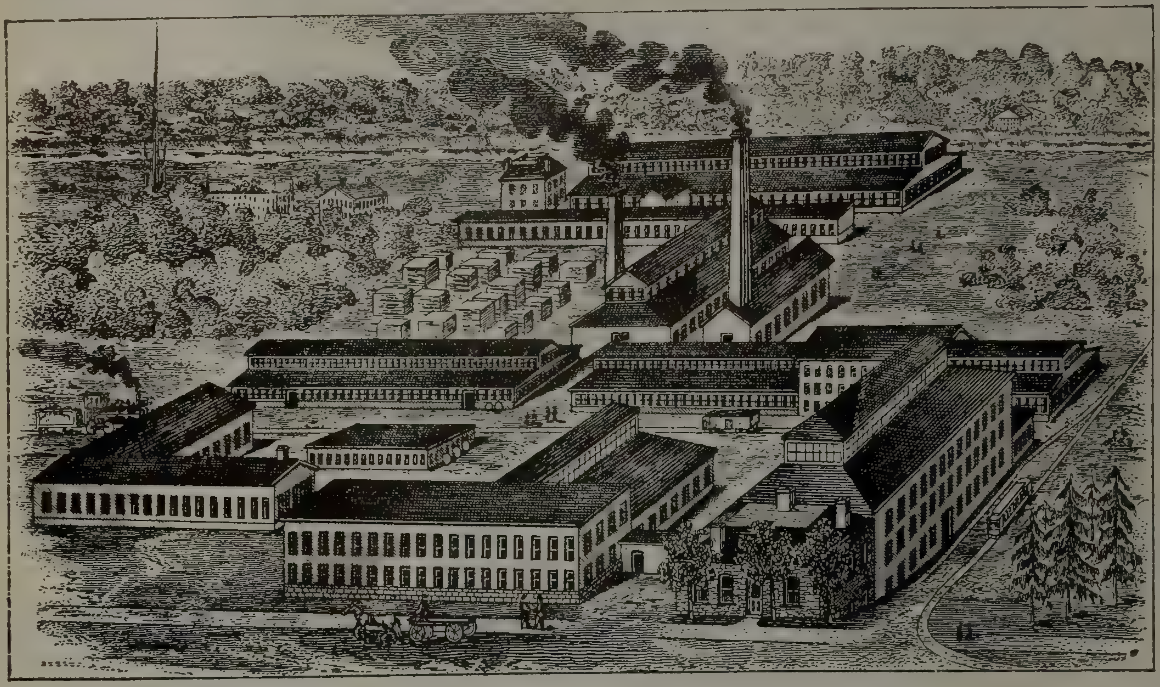
MAPLE LEAF SAWS

The Improved Racer Cross Cut Saw, by Actual Test, is the Fastest and Easiest Cutting Saw Made

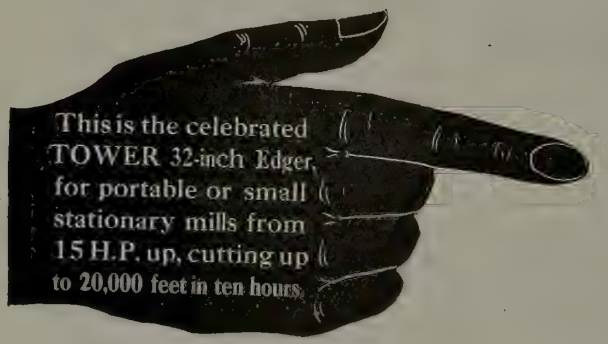


The Maple Leaf saw is higher priced than the ordinary saw because it costs more to make it. It is made of the very highest quality of steel and tempered by a secret process which toughens and refines the steel. The Maple Leaf trade mark on the saw means that it is the equal, if not superior to any saw made. It also means that you are privileged to test it against any other make and if not found equal or superior in quality you can return it and have your money refunded.

The ambition of the manufacturers of the Maple Leaf Saws has always been to produce the best tempered saw in the world and they are constantly investigating and experimenting with this end in view. They have recently made some valuable discoveries in evenness of temper. It has always been difficult to get a perfectly even temper on long and thin sheets of steel, such as saws are made of. Our recent discoveries make this an absolute certainty. Every user of saws should bear in mind that the temper of the saw is its most valuable quality. High finish and attractive appearance amount to nothing if the temper is not right.

All Maple Leaf Saws are Guaranteed to be Perfect in Temper

Shurly-Dietrich Co., Limited Galt, Ontario



This is the celebrated TOWER 32-inch Edger, for portable or small stationary mills from 15 H.P. up, cutting up to 20,000 feet in ten hours.

Front and main pulley side, No 4 Tower 32-inch Edger with levers for shifting saws. Rear table not shown. Back press roll raised.

The bed of the husk is in one piece, instead of being held together with rods.
The vital parts therefore always retain their proper relative positions.
The saws may be readily removed without disturbing the arbor.
There is an outside support for the main pulley, which is very much better than to have it overhang.
The adjustable guide is by far the simplest and most accurate and reliable to be found on any machine, however expensive.
The arbor is provided with a steel featherkey for driving the saws.
The indexes are on the front end of the front table, where they are readily seen by the operator. This is especially important on dark days or where the edger stands in a dark part of the mill.
The indexes are adjustable, to adapt the machine to cut scant, exact or plump, according to the requirements of the trade.
Each table is ten feet long, and is provided with iron cross girths and legs.
Every part of the machine is made to template, which insures a perfect fit and perfect adjustment.
Every piece of the machine is also lettered and numbered, which makes it easy to obtain repairs in case of fire or other accident.
Notice that these edgers contain many features usually found only in large and high priced machines.
We also make larger and heavier edgers, our line comprising seventy-two standard sizes and styles. We build them all with either levers or hand wheels to shift the saws.

Isn't it Better to Investigate

"The HOWARD" Vulcanizing Process

than to wish you had

Positively the quickest and most economical system known for drying and Preserving Lumber, Railroad Ties, etc.

POINTS IN ITS FAVOR:

Does away with all kilns
Improves quality of all lumber
Increases the crushing strength
Increases the transverse strength
Reduces the weight 30 per cent to 45 per cent
It materially prolongs the life of wood
Eliminates shrinking, swelling and warping
Emphasizes and beautifies natural grain of the wood
Makes fit for commercial use woods not otherwise merchantable
Does away with necessity of maintaining heavy stock of lumber in yards
By this process green lumber taken from the log can be used for building purposes in 2 or 3 days

---

We invite Lumbermen and Owners of Woodworking establishments to see a practical demonstration of the process at our plant in Toronto

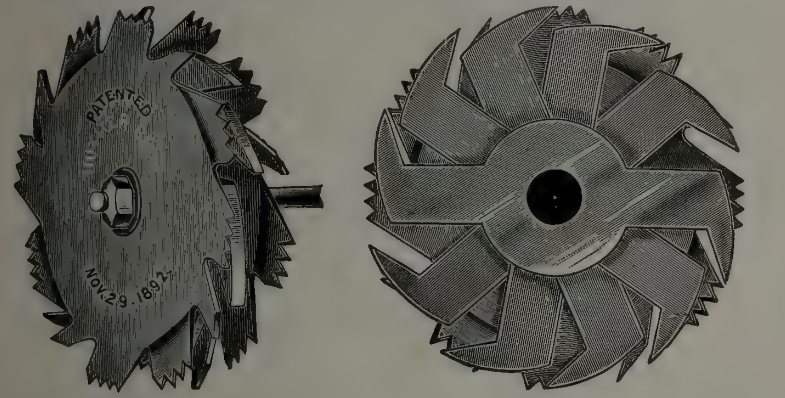
For cutting any width groove from one quarter inch to 2 inches or over



Can be used on any Circular Saw Material. Will cut a perfect groove with or across the grain. This is the only Dado Head on the market that gives entire satisfaction on all classes of work. No screw adjustment. For different width grooves, simply remove or add inside cutters. Sold by builders and dealers of wood working machinery in all parts of the United States. Will send on approval, in competition with any other make on the market; if not the best return at our expense.
HUTHER BROS., SAW MFG. CO., Inc., 1170 University Ave., ROCHESTER, N.Y., manufacturers Circular Saws, Morgan Pattern Lock-Corner Box Cutters, Concave Saws, etc.

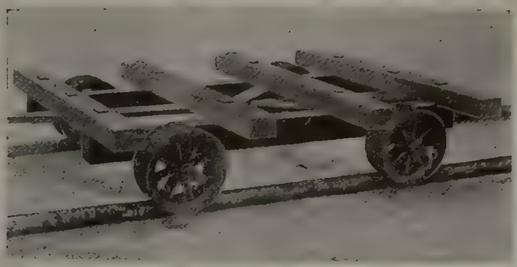
The Keystone Pole Tram Car



Indispensable to every saw mill. It runs on poles from 6 to 10 inches in diameter and the wheels are concave.

This method of conveying logs, pulpwood, or coal is undoubtedly the best and the cheapest that jobbers and mill-men can use. It can be used to great advantage on low and marshy ground.

We would appreciate the opportunity of furnishing you with further particulars.

4-SAW LATH BOLTER

Lath Bolter

4-Saws

Here are a few of the important features:

The frame of this machine is made solid in one piece and all bearings for mandrel and feed roll shafts are cast solid in frame, with the exception of the mandrel bearing outside of saws, which is removable for taking out saws. This bridge, when in place, is held securely in alignment on planed surfaces by large cap screws with wrench handles Frame is supported by two stands with planed surfaces, and securely bolted.

The front and rear pressure rollers are power driven.

The front pressure roller raises towards the saws and being power driven, prevents any pieces from flying back out of the machine.

The end bearing may be easily removed, which permits the saws being taken off the mandrel for filing. This does not disturb the mandrel.

Manufacturers of

Saw Mill, Shingle and Lath Machinery and Accessories.

Engines, Boilers and Steam Pumps, Transmission Machinery.

Full Particulars Given on Application.

Heavy Duty Lath Machine

This machine is built very strong and substantial, and will suit any mill, large or small where a large output of lath is required. The top or main frame is made in one casting, and is supported by two heavy iron stands, well braced, which makes a very rigid machine.

The bearings on either side of drive pulley are solid in frame, while the third one is so arranged as to be easily removed for the taking out of saws. This bearing, or bridge, when in place is kept in perfect alignment on planed surface, by large cap screws with wrench handles.

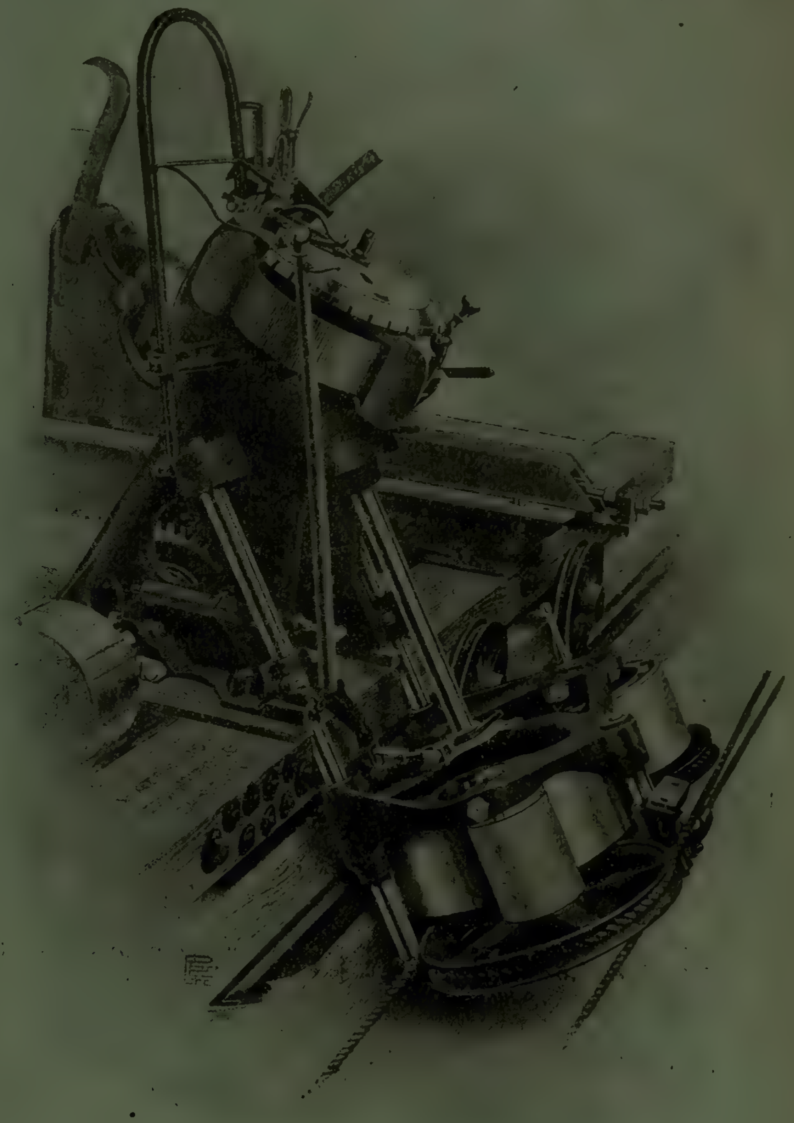
"No Heat - No Work - No Lost Motion"

THE TROUT POWER SETWORKS



Positively the Most Powerful, Accurate and Efficient Setworks Built.

The Trout Power Setworks is rope-driven. It combines a set and receding works in one machine and will turn out more lumber and better lumber than any other setworks on the market.

JUST FOR THESE REASONS:—

¶ There are only two levers to operate.

Setting is accomplished without stooping or bending.

There is no heat from the steam cylinder.

¶ There is nothing to tire the setter.

He can give his undivided attention to the sawyer's signals and cut as much lumber at the end of his shift as at the beginning.

¶ Working parts throughout are of finest selected steel.

The operation is without rack or jar, eliminating any destructive wear.

No lost motion can possibly develop.

¶ The setworks will set by 1-32 inch up to 6 inches at one manipulation of the lever.

The size of the logs does not affect the speed or the accuracy of the set.

¶ Further, the machine is entirely self contained.

It requires no change in the carriage frame.

Can be attached to any size of carriage, Rack or Screw movement.

¶ We are the sole builders of this machine. Perhaps you have seen it at work. If not the best thing to do is to visit us or to write for a fuller description than we can give here.

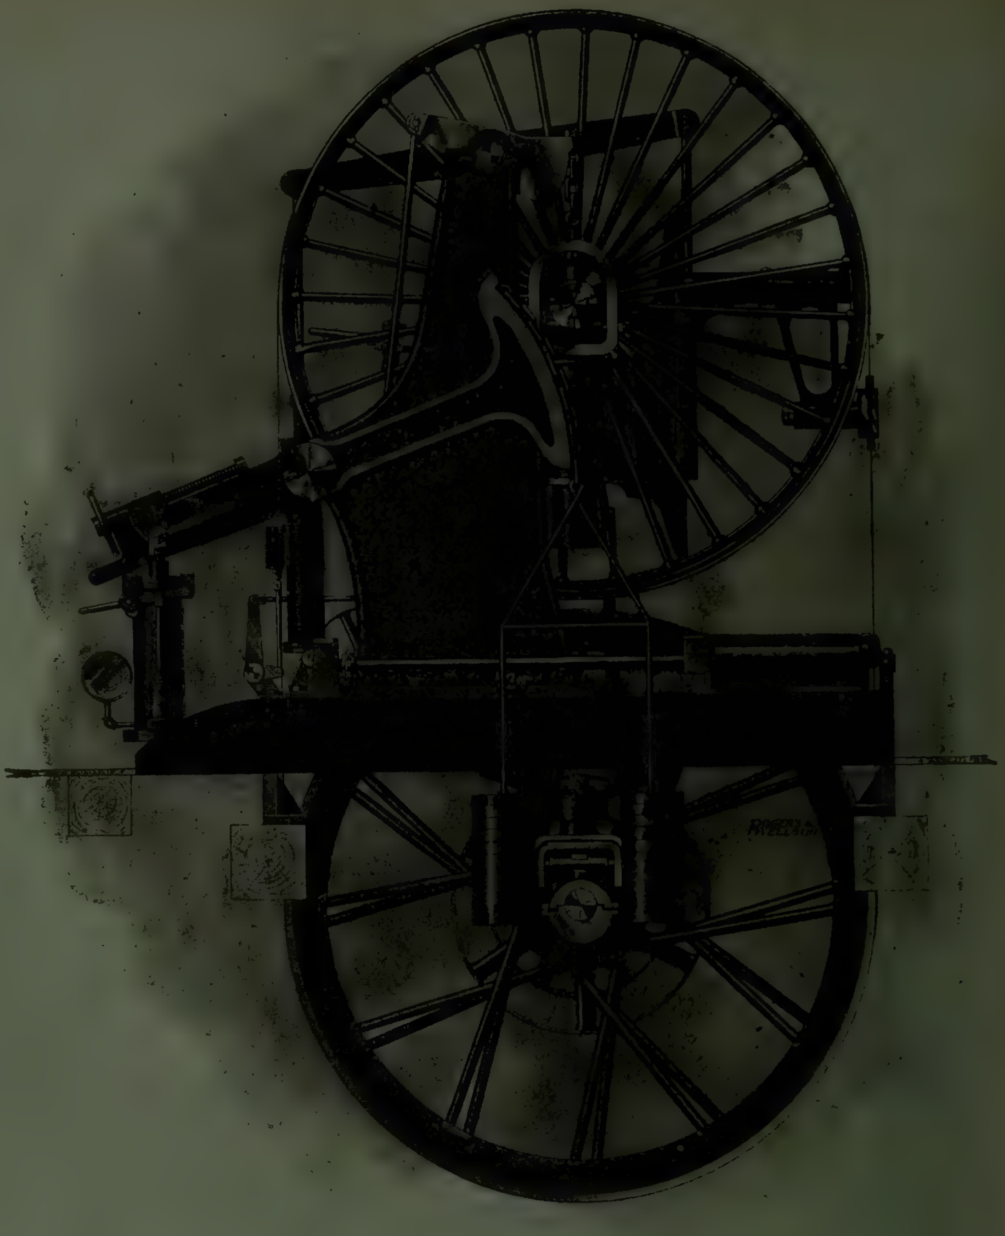
B. J. COGHLIN & CO., Limited ∴ ∴ **MONTREAL**

The Steam Tension Band Mill



is made with 8 foot, 9 foot and 10 foot wheels. As you know, the top wheel and upper guide are operated by separate steam cylinders.

Some obvious advantages of this are, the great speed with which the guide can be raised and lowered, the extremely sensitive tension on the saw, and the quick time with which saws can be changed.

You will see at once that considerable time is saved in one day, over the usual weight tension mill.

And no tensioning system has yet been made, that is as sensitive as our steam tension ; so that your saw is more easily kept in perfect shape and at the right tension at all times — which means better lumber.

Any mill which will increase your cut, and probably improve its quality is worth your while looking into ; and besides, there are other special features which increase its value to you.

Shall we send our catalogue?

HOLLOW BLAST GRATE
on APPROVAL.
You need not keep it
if it is unsatisfactory.
WE pay the freight.

On the market twenty years, first in its original and then in its improved forms. Over 6,000 sets in daily use.

The following is a sample of our correspondence :

Before Using

Cleveland, O., Dec. 10th, 1907

The Gordon Hollow Blast Grate Co.
Greenville, Mich.

Gentlemen :

I have three 300 H.P. Wickes Vertical Boilers with Dutch ovens attached to a 4-ft chimney in use at my saw mill, burning all wet fuel but I am not able to raise enough steam. Each grate surface is 7 ft. wide by 6 ft. long.

Will your hollow blast grate improve my condition and raise my steam? If so, I would kindly ask that you give me your price on same.

Awaiting your reply, I remain,
Very truly yours,
THEODORE KUNDTZ

After Using

Cleveland, O., July 24th, 1909

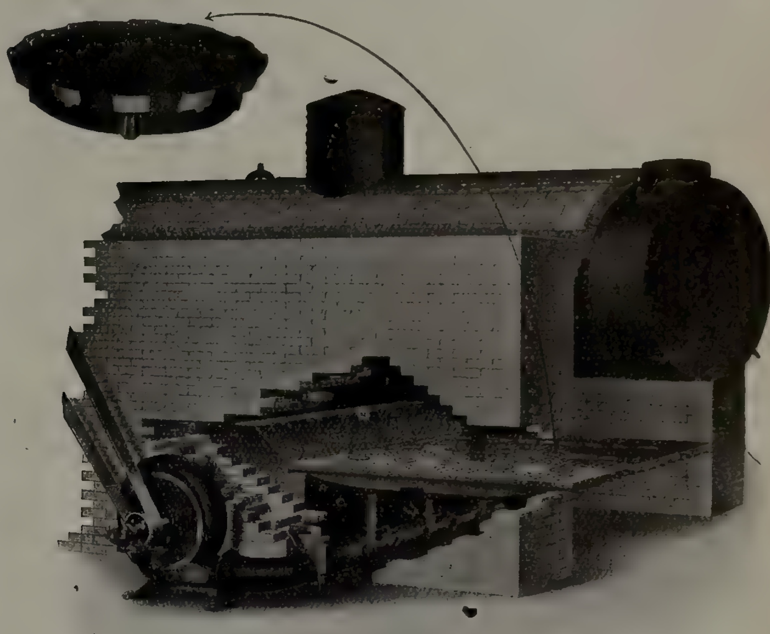
The Gordon Hollow Blast Grate Co
Greenville, Mich.

Gentlemen :

I had three 300 H.P. boilers in use at my saw mill, burning mostly wet fuel, and WAS NOT ABLE TO RAISE STEAM ENOUGH TO KEEP RUNNING

Since installing your hollow blast grate I have been using only TWO of the boilers and have STEAM TO SPARE and I would recommend your grate to anyone using WET FUEL or NOT HAVING CHIMNEY DRAFT.

Very truly yours,
THEODORE KUNDTZ



The Gordon Hollow Blast Grate can be used in plain furnaces or Dutch ovens, and with any number of boilers, from one up. Calls for no change in construction. Easy to install and operate. Saves labor in firing. Is kept comparatively cold by the current of air within, which makes it practically indistructable. Does not throw sparks. Can be fired on without running the blower, if desired, this is often necessary at night.

In writing for prices state how many boilers you have and whether you have ordinary furnaces or Dutch ovens, and give width and length of grate surface or surfaces

Gordon Hollow Blast Grate Co., - Greenville, Michigan

Also manufacturers of the celebrated "TOWER" line of Edgers and Trimmers

We have been making Knives seventy-eight years, long enough for us to be sufficiently sure of the Knives we make, to give an unqualified guarantee of satisfaction with them.

The steel used in Simonds Canada Saw Co., Limited, Knives is our special crucible steel, made in the Simonds Steel Mill especially for Simonds Saws and Knives.

Thus you will see we start right, and thereafter the steel is handled most skillfully until the finished knife is produced.

Whether you want planer, Veneer, Stave, Shingle, Moulder or any other woodworking machihery knives, you may go as far as you like, try as many makes as you like, you cannot improve on Simonds Knives. Of course, different conditions require different knives, a difference in the temper most likely. Given an idea of the kind of woods to be cut, the machine on which the knives are to be used, and the dimension, we guarantee to give you Simonds Knives that will be perfect in balance and temper, exactly right to do the greatest amount of smooth cutting with the least amount of wear and care.

When you buy Knives, always buy Simonds

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 31 Toronto, February 15, 1911 No. 4

A Good Year's Record for C. L. A.

The third annual meeting of the Canadian Lumbermen's Association, which was held at Ottawa on February 7, afforded good proof of the value of co-operation among the members of the lumber industry. When one considers the benefits which have actually accrued to the lumbermen of Canada as a direct result of the work of the Association, it is a matter of some surprise that the Association has not grown more rapidly. There can be only one reason for this, namely, that the lumbermen in general have not yet learned of the importance of the Association to their own interests.

During the three years of its existence, the Canadian Lumbermen's Association has obtained results which would otherwise have taken years, and in some important instances might not have been secured at all. Since the annual meeting last year, for instance, the Association has been engaged in the carrying on of several campaigns of the utmost importance. At about this time last year the lumbermen of Canada were threatened with the creation of an insurance monopoly in Canada, which would have prevented them from insuring in the mutual companies of the New England States, which carry on business co-operatively and not for profit, and which therefore are able to charge much lower rates than any that can be secured from the old line companies. The old line companies did their utmost to prevent these mutual companies from doing business in Canada without being registered in this country. Inasmuch as the cost of registering in Canada was too high to make it profitable for these companies to register, it looked for a time as though lumbermen and others who wished to insure in them would not be permitted to do so. The Canadian Lumbermen's Association was one of the most active opponents of the proposed measure, and succeeded finally in having it killed in the Canadian Senate.

Another direction in which the Association made its influence felt for the benefit of industry was in the matter of a new regulation which was required by the United States Department of Customs in connection with the statements of quantities of lumber shipped to that country from Canada. The new regulation required that the tally sheets accompanying all lumber which was shipped into the United States should not simply state the estimated amount of lumber in the shipment, but should give in detail the exact measurements of each piece in the shipment. This would have been an expensive and almost unbearable burden upon the lumber exporters of Canada. There seemed to be some excuse for the order, as the Treasury Department at Washington had learned that, in some cases, advantage was being taken of the Government, and the amounts shipped by Canadians or imported by Americans were occasionally considerably in excess of what was mentioned in the customs statements. The Treasury Department, however, seems to have given little thought to the practical end of the matter. They thought to overcome the loss by ordering that, in future, the statements should include complete details of measurements.

The Canadian Lumbermen's Association took the matter up and communicated with the Department at Washington, pointing out to them the great expense that such a requirement would involve. At the request of the Association, an official of the Treasury Department was sent to Ottawa, and the secretary of the Canadian Lumbermen's Association took him in charge. One visit to a lumber yard and a demonstration of the method of estimating lumber with the stick, was sufficient to persuade the visitor of the extra work that would be involved if the actual dimensions of each piece of lumber had to be entered on a statement. He went back to Washington, and the new regulation was immediately withdrawn. The desired object is now being obtained in another manner, namely, by the careful attention of the secret service corps to the actual cases in which wrongful statements are suspected.

These are a few only of the instances of the excellent work which has been done by the Association during the past year. In some other rspects they have not been so successful, but this has not been for any lack of painstaking attention to the interests of the industry. In the matter of the new freight rates on lumber, for instance, it appears for the present as if the lumbermen have got the worst of it in the argument before the Board of Railway Commissioners. The Association, however, is still sticking to it, and the next move will be an application to the Board for a review of its orders in connection with the export freight rates on lumber.

These are matters of direct practical interest to the industry. There is, however, another respect in which the value of the Association is, if anything, even greater than in regard to these. This is in the spirit of friendliness and co-operation which it has engendered among the representatives of the industry from widely separated parts of the Dominion. When the Association was formed three years ago, there were those who declared that it was doomed to failure on account of the widely divergent interests of lumbermen in different parts of the country. The outcome of events has proved that these fears were unfounded. The very opposite, indeed, has been the case, and it is a matter of surprise even to those who were most ardent in the promotion of the Association that so many opportunities for co-operation have developed, and that the supposed difficulties have turned out to be so unimportant.

Forest Resources Must be Protected

Canadians have an important matter to bear in mind in regard to any international agreements of the nature of that which is now under consideration between this country and the United States. They must not forget that the people of the United States have been wasteful of their natural resources, and that they now want to use those of Canada. Any of the natural resources of this country which are in danger of destruction, such, for instance, as the forests, and which can be preserved by a careful conservation policy, should be fenced round and a watch set upon them, to see that they are used only in such a manner as to leave them unimpaired for posterity. The Governments of Ontario, Quebec and British Columbia have already done much in this direction by forbidding the export of their logs. In the proposed tariff arrangement there is a clause which provides that paper will be allowed to enter the United States free of duty, if these restrictions against the export of pulpwood logs are removed by the provinces. This clause should never have been permitted to appear in the agreement. It is an insult to the provinces, and its purpose is so clear that no one has ever attempted to deny it. It is placed there simply as a sop to the paper manufacturers of the United States, in order to show that the party at present in power has done its best to secure free pulpwood. Fortunately, there is no fear of this being brought about. Hon. Frank Cochrane, Minister of Lands, Forests and Mines for the Province of Ontario, has already shown his hand, and there is no chance of the province ever losing one single sawlog, so long as he is in charge of the department. The same is practically the case in Qeubec.

A review of the situation, so far as it is possible to review it at the present time, leads to the belief that Canada would have been just as well off without it, that her dignity, in fact, would have been better preserved, if she had shown less haste about accepting the proposals of the United States, and that possibly a few years from now we shall be wondering why the matter created such a stir.

The Value of British Columbia Timber Properties

In a recent article in the Canada Lumberman, the opinion was expressed that it was a fortunate matter for the lumber industry of Western Canada that capitalists in Great Britain had not taken very kindly to some of the recent British Columbia timber propositions which were placed on the English market last year. The possibility of a boom in Western Canada timber stocks in Great Britain was looked upon with considerable anxiety by many of those who were in close touch with the lumber and timber situations in Canada. Had there been anything in the nature of a well proportioned boom the results might have been extremely serious, for not only were conditions in the lumber markets of Canada unsuitable to any such developments, but it was felt strongly that timber stocks were not of the kind in which such speculation should be encouraged. Had there been anything similar to the speculative fever which developed in the rubber markets, there would have been inevitable loss.

This is not to say that there are not many fine opportunities in Western Canada to-day for the investment of money in timber properties or sawmilling propositions. It is simply to say that the conditions of the lumber industry do not properly lend themselves to any such manipulation as it seemed for a time was imminent. The manner in which the subject is viewed in the old country is indicated by the following article appearing in the last issue of the "Timber Trades Journal," of London, Eng.:—"The persistent efforts made to interest the investing public in this country in British Columbian forest properties for some months past have, we understand, been only partially successful. This is not a matter of surprise, as some of the estimates put forward are open to criticism. The value of the manufactured lumber, for instance, appears to be pitched at too high a level. A profit of seven dollars per thousand feet super on the marketed product would, of course, give a very handsome return, but practical men who thoroughly know the business put the probable profit at a much lower figure. It is also significant that few of these ventures have practical men connected with the timber trade on the directorate. In fact, we do not remember, except in one particular instance, that timber merchants have been prominently connected with the management of these properties. The timber trade, in fact, look askance at these ventures, and the sensational articles which have recently appeared in the daily press, foretelling a rapidly approaching famine, fail to impress the minds of those who are more conversant with a glut of timber on the market, instead of a shortage. There is, of course, a very extensive timber business carried on in the coast regions of British Columbia and Washington State, but principally for export to countries across the Pacific Ocean, a very small fraction of this manufacture reaching Europe, the voyage by the circuitous route round Cape Horn being too costly. In the Pacific Coast districts the climate permits the operation of the mills on an average for eleven months in the year, but in the mountain districts of the interior sawing is suspended for at least five months in the winter, and during this time little or no profit is made on capital outlay, which is a serious consideration. By latest advices from Western Canada, the prairie district supplied from the mountain regions of British Columbia, we hear that the lumber trade was in a very depressed condition during the latter part of the year just closed. Last July, owing to the excessive drought in the prairie provinces and the unsatisfactory conditions existing among the American mills, large quantities of lumber were forced into the Canadian markets, prices fell to a point considerably below the actual cost of production, and, owing to the arrangements made by the majority of the mills for their output, it is stated that over one hundred million feet of lumber were sold last year at a price below the actual cost. In British Columbia, as in other places, complaints are rife concerning the constant fluctuations of prices, especially amongst retailers, and, like us, they suffer from foreign competition, their market being swamped with dumpings from the United States, when opportunity serves. The European timber importing countries have only a limited interest in the productions of the North Pacific coast forests, and this interest is not likely to be increased until the completion of the Panama Canal cheapens the cost of transit."

Canadian Spruce in the United States

Manufacturers of eastern Canadian spruce will be interested in the reappearance before the courts of the United States of the customs case which has already been the subject of two decisions. In the matter of 1⅞-in. spruce imported into the United States from Canada, the Treasury Department made a ruling about a year ago that 1⅞-in. short spruce should be dutiable at the full 2-in. measure, because, while purchased at the mills as 1⅞-in., it was claimed that the custom of the trade was to sell it in the local markets as 2-in. stock. This ruling of the board was appealed to the Board of General Appraisers and after a full hearing the ruling of the Treasury Department was reversed. It is now reported from Washington that the Treasury Department, not being satisfied with the decision of the Board of Appraisers, has taken steps to appeal the case to the new Customs Appeals Court. It seems scarcely possible that the United States will construe their tariff act in such a manner as to make it include a direct contradiction of terms, and yet stranger things than this have been done in connection with tariff affairs. If, in the future 1⅞-in. lumber is to be known as 2-in. lumber, to the customs officials, a large volume of international trade will be effected, the duty will be rendered higher, and, in order to protect their interests the importers will have to resort once again to the courts. No doubt, however, the importers will put up a strong case against the proposed change when the case is opened before the new Customs Appeal Court, and as the facts are so clearly in their favor they are likely to receive a favorable decision.

Another customs matter which is somewhat more complicated, but which involves a point of much interest to shippers of Canadian spruce, is also to be appealed by the Secretary of the Treasury to the Customs Appeal Court. On November 30th last the customs appraisers held that certain spruce planed on two sides and two edges 1 in. to 1¼ in. in thickness, which was assessed as lumber planed on four sides, was properly dutiable under the same paragraph as lumber planed on two sides. As far back as 1904 a decision was given on practically the same subject in the following terms: "There is no mention in the paragraph of the planing of two edges and we think it to be clearly manifested that the intent of Congress was to impose upon such lumber, in addition to the duty of $2.00, fifty cents if planed on one side, $1.00 if planed on one side and tongued and grooved, and $1.50 if planed on two sides and tongued and grooved, and that it was not intended that any additional duty should be imposed on account of one or even both edges being planed, if not tongued and grooved."

It is believed, however, that in spite of the above decision, the present appeal is to be based on the new tariff law passed a little over a year ago, the phraseology of which, applying to lumber, is materially different from that of 1897, the new act mentioning distinctly the four sides of lumber, which is construed in some quarters as of necessity including the adges. The new law says: "But when lumber of any sort is planed or finished there shall be levied in addition to the rates herein provided the following: for one side so planed or finished fifty cents per thousand; for planing and finishing on one side and tongueing and grooving, or for planing and finishing on two sides, seventy-five cents; for planing or finishing on three sides, or planing and finishing two sides and tongueing and grooving, $1.12½; for planing and finishing four sides, $1.50."

It looks as though the lumber importers will have to make a strong fight to overcome this threatened increase in the duty. Eastern Canada manufacturers have much at stake in these two matters

The Pulp and Pulp Wood Situation—Canada's only Course

There can be no question that the representatives of the Canadian Government have taken a wise course, in fact the only course which was open to them, in connection with the export of pulpwood to the United States. They have made it unmistakeably plain to the people of the United States that however desirable the free interchange of paper between the two countries may be, the control of the export of pulp wood cut from Crown lands is under the jurisdiction of the provincial governments alone.

For the provinces, the question involves a mixture of expediency and national interest. If these two interests clashed it might become the duty of the Provinces which prohibit the export of pulp wood to remove the prohibition. Fortunately this is not the case and the interest of the Provinces is in a large measure the interest of the Dominion. The position of Canada in the matter of pulp wood is very strong. We have merely to be content for a few years while the pulp wood resources of the United States are being exhausted, and th logic of events will force the manufacturers of that country to establish mills in Canada. Even at this early date the movement has already commenced. Then, so far as the duty on paper is concerned, Canadians can afford to be patient, and for the time being indifferent. With a shortage of pulpwood and a considerable shortage of water power, the mills of the United States will, in a few years, be unable to meet the demand of that country. Even to-day the production of news paper in the United States is having difficulty in keeping up with the supply. As the supply falls more and more below the demand, the powerful publishing interests of the United States will be able to force the paper duty down to a low point. It is not unreasonable to look forward to an entire removal of the duty on paper entering the United States, notwithstanding the continued maintenance by Canada of an embargo upon the export of pulp wood

In an editorial reference to this subject the Toronto Globe says: "In a large view of the problem it must not be forgotten that Canada may have reserves of pulpwood great enough to maintain for all time a very large and profitable paper manufacturing industry, but certainly not large enough to meet for all time the tremendous demand for pulpwood that must spring up within a few years when the United States reserves are exhausted. Whatever the decision of the Provinces may be, Ottawa has done all that could be expected in leaving the door open for absolute free trade in the raw materials for papermaking and in news print and coarse papers."

Editorial Short Lengths for Busy Readers

After full consideration of the text of the proposed reciprocity agreement, the B.C. Lumber & Shingle Manufacturers' Association decided to forward a telegram to the Dominion Government at Ottawa, asking what the exact situation is with respect to the reciprocity arrangement on the export and and import of shingles. From the information so far obtained, it is stated that the duty on Canadian shingles going across the border line will be reduced from 50 cents per thousand to the old basis of 30 cents. If there is to be reciprocity, the shingles of the Canadian and American manufacturers ought to be on an even basis, say shingle men, and if that were the case, there would be little fear of the Canadians failing to hold their markets. Under the terms of the agreement as published at Ottawa, no duty is provided for on shingles entering Canada.

The National Association of Lumber Manufacturers of the United States, through their President, Edward Hines, of Chicago, have protested to the Ways and Means Committee against the Canadian reciprocity bill as threatening disaster to the lumber manufacturers of the United States. Mr. Hines says that the proposed trade agreement permits the entry into the United States, free of duty, of wood for the manufacture of wood pulp, but still excludes logs for the manufacture of lumber. He said that there are billions of feet of pine timber on the Canadian side, in close proximity to American sawmills, and that the logs can be floated down stream into American territory, but that they are excluded by prohibition of the Provincial Governments of Canada.

He suggested an amendment to the bill to include free admission of logs for the manufacture of lumber. Chairman Payne, of the committee, said that any amendment of the bill meant simply killing the bill.

Lumber is the cheapest article of commerce on the market today compared with present values of what the producer has to sell. To-day the producer can buy one-third more lumber for the price of a horse, steer or hog than at any other time in the last ten years, except possibly a short period in the early part of 1910. More than that, immediately following the financial flurry of October, 1907, values of practically all commodities, including lumber, struck the toboggan. But shortly after the summer of 1908 values of nearly all commodities began to spring upward until the high water mark in prices was reached during 1909. Lumber, however, did not waken up; did not take the spring. It remained down at or near the point of value immediately following the October, 1907, panic, and has remained there ever since. More than this, lumber is sold at retail at a lower percentage of profit than any other article of commerce, except possibly sugar and nails.—C. A. Kinkbine, before the Northwestern Retailers' Association.

The exact wording of the pulp and paper section of the proposed reciprocity agreement between Canada and the United States, as reported to the United States House by the Ways and Means Committee, is as follows:—"Pulp of wood mechanically ground, pulp of wood, chemical bleached or unbleached, news print paper and other paper and paper board, manufactured from mechanical wood pulp or from chemical wood pulp or of which such pulp is the component material of chief value, colored in the pulp or not colored and valued at not more than four cents per pound, not including printed or decorated wall paper, being the products of Canada, when imported therefrom directly into the United States, shall be admitted free of duty on the condition precedent that no export duty, export license fee or other export charge of any kind whatsoever (whether in the form of additional charge or license fee or otherwise) or any prohibition or restriction in any way of the exportation (whether by law, order, regulation, contractural relation or otherwise, directly or indirectly) shall have been imposed upon such paper, board or wood pulp, or the wood used in the manufacture of such paper or board."

Third Annual Convention of the C.L.A.

Representatives of Lumber Industry from Many Parts of Canada Discuss Important Trade Issues — Railway Freight Rates the Chief Subject — The Tariff Arrangement

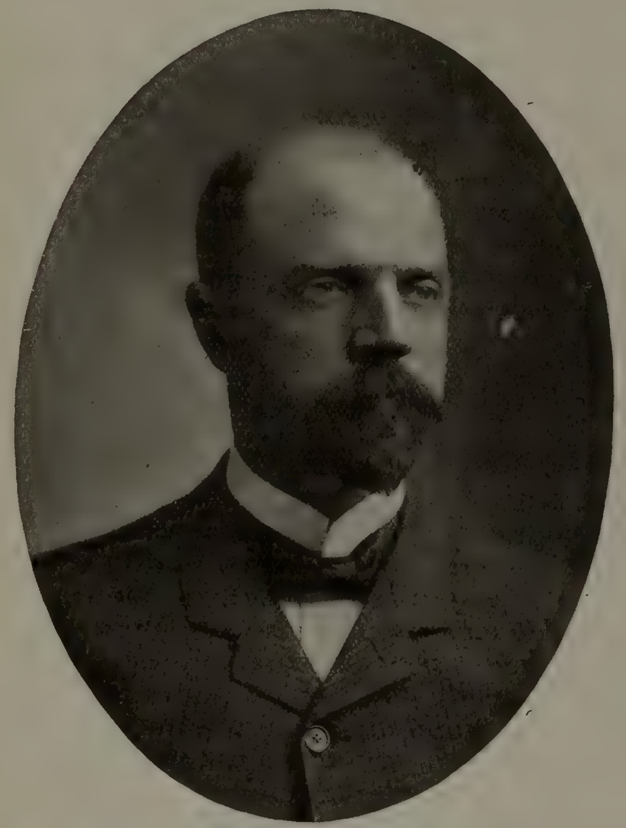
The third annual meeting of the Canadian Lumbermen's Association was held at Ottawa on February 7, at the headquarters of the Association, in the Carleton Chambers. In spite of the fact that a heavy snowfall in many parts of the country had delayed the arrival of a number of the members who counted upon attending, there was a good representation from the various provinces, and the business of the meeting was disposed of in a most satisfactory manner.

The President of the Association, Lt.-Col. J. B. Miller, of the Parry Sound Lumber Company, Toronto, presided, and in his annual address spoke as follows:—

President Miller's Address.

Since our last annual meeting, held on February 1, a year ago, there have been several important matters, to which I desire to call your attention at this time.

At the previous session of the Dominion Parliament, as you are aware, the long-promised Insurance Bill became law. The part played by this Association in securing for the insuring public of Canada the freedom to place their insurance with companies, underwriters, mutuals or reciprocals, had undoubtedly much to do with the final result, and in addition to the financial benefit in securing reduced premiums, had the views of the "All Canada Insurance Federation" prevailed, it would have meant an absolute monopoly of the fire insurance business in Canada for the old line insurance companies.



Lt.-Col. J. B. Miller, Toronto, re-elected President of the C.L.A.

With regard to the question of the providing of car stakes and fastenings for lumber loaded on flat car, as you are aware, the application of the Canadian Manufacturers' Association, in which this Association joined so far as the lumber shipments were concerned, was heard first on April 6, 1909. A subsequent hearing was held on February 15, 1910, and although there have been very many interviews between our secretary and the officials of the Board of Railway Commissioners, we have no been able yet to secure a definite order on the matter.

The Lumber Freight Rate Case.

This is probably the most serious question to which I have to invite your very careful attention to-day. After four hearings before the Board of Railway Commissioners, in addition to an informal meeting in the office of the chief traffic officer of the Board, an order was issued on May 10, 1910, dismissing our application, in so far as the rates on domestic shipments of lumber are concerned. The principle of rates for export being lower than those for domestic, was clearly annunciated in the same order, and the railways were instructed to file tariffs to be made effective not later than the 15th of June, 1910. The railways did not comply with this order, and the matter being pointed out to the Board of Railway Commissioners, by our secretary, the question was put down for the fifth hearing on September 20, 1910. A subsequent order was issued on November 17, 1910, specifying certain territory in which export rates therefrom, to Montreal, shall be lower than the domestic rates. Taking the records of actual shipments, furnished by the railways themselves during the progress of this case before the Board, it shows that over 77 per cent. of the cars shipped for export are not provided with export rates, which are less than the domestic rates from the same points. This, it is felt, is discrimination, and it will be for you to determine what course this Association should adopt. I will leave it to the report of our Transportation committee to give you the details of this matter.

Under the rules and regulations of the Board, we have the privilege of asking for a review of any order or orders, within 30 days of the date of the final order, and as it was deemed advisable that we should ask your opinion, request was made to the Board of Railway Commissioner for an extension of time to, say not later than February 15, 1911, in which to make an application for such review. This request was granted. Altogether apart from this request for a review, under Section 56 of the Railway Act, we have the right of appeal direct to the Governor-in-Council, against any order. It is not necessary for us to get permission to do this from the Board of Railway Commissioners, and beyond the cost of having our solicitor appear in support of the appeal, there are no costs attached thereto. In view of the enormously increased takings of the railways for carrying freight, it is felt that the tariffs which became effective on May 1, 1908, are abritrary, unjust and unnecessary. I hope that some member will make a motion in this connection, so that full discussion may be had on the matter.

With regard to limits held under license, which are constantly being alienated for the purpose of so-called settlement, a representative delegation of the members of the Association waited upon the Hon. Frank Cochrane, Minister of Lands, Forests and Mines for Ontario, October 26, 1910. Mr. Cochrane took very strong ground in opposition to the lumbermen, and claimed that some means would have to be adopted whereby limits which have been cut over would have to revert to the Crown. The seriousness of this proposition would seem to call for the very active co-operation of every lumberman in the country, and I think it will be admitted that this Association should take up this question seriously, and that your officers should be authorized to take such steps as will protect the holders of licenses in their rights. I would like full discussion to be had on this matter.

I, myself, with many other members of our Association, attended the convention of the Canadian Forestry Association, held at Quebec in January. The proceedings were very interesting, and, as far as I can see, there is nothing suggested at this convention which would in any way clash with the interest of the lumbermen.

The Tariff on Lumber.

In regard to the trade relations with the United States, it looks as if the proposed trade arrangements between Canada and the United States would become law on both sides of the border. This will put the lumber trade in the two countries on an equal footing. Therefore, there will be no necessity for the Association taking any further action upon the question of duty on lumber coming from the United States into Canada.

Trade conditions for the past year have not been altogether satisfactory. While the demand and prices of the upper grades have been good, the lower grades have been slow of sale and at poor prices, largely, I take it, on account of political unrest on the other side of the border, which has caused people to buy from hand to mouth, rather than stock up. These conditions seem to be changing, and the prospects for better trade in the lower grades this year are much brighter. If the tariff changes above referred to are put through in the near future, it will no doubt have the effect of making sales much freer, and there will probably be a hardening of prices at the same time.

Tally Sheet Difficulty Overcome.

Regarding order No. 30,439, of the United States Treasury Department, March 21, 1910, calling for copy of the tally sheet, or in lieu thereof a specification of the number of pieces of each size and length of lumber laden in each car, on representations being made by your Association, the Department sent a representative to Ottawa, and the matter was gone thoroughly into by our secretary. The result was that the order was modified, and all that is now required, as you well know, is the commercial description, kind of lumber, number of pieces and the aggregate number of feet, board measure, laden in each car.

Depredations of Log Pirates

Our friends in British Columbia have suffered great hardship from the depredations of log pirates, and as no relief could be obtained, application has been made by this Association to the Department of Justice for amendment to the Criminal Code. All papers are now before the Minister of Justice, and it is hoped that, during the present session, this suggestion will be translated into law, and if it is, we feel that it will do away in a large measure with the disabilities under which the Pacific Coast lumbermen are suffering.

The visit of the grain growers' deputation to this city is no doubt well known to you all. The particular part in connection with this matter was a statement made by one of the delegation, that they were going to organize sawmills and start lumbering operations on their own account.

The recent organization of retail lumber dealers would seem to call for some action on the part of this meeting. If the retail lumber trade is to determine grades, terms, prices, etc., you will perhaps decide to what extent these demands are to be met, if at all.

At the last annual meeting, the question of the payment of expenses to directors and members of committees was laid over for a year. If you are prepared to discuss this matter, opportunity will be given you to do so.

Certain firms who have been approached by your secretary to join this Association have demurred, owing to the fact that they were operating solely in hardwood. There are not many of these firms in Canada, but perhaps you will decide as to the advisability of forming a hardwood section in connection with this Association.

The Secretary's Report.

The report of the secretary was then presented as follows:—

The detail coming under the immediate supervision of your secretary has been followed as carefully as possible, and the effort has been to place in your hands, by means of circulars, etc., apart from the regular information taken from the weekly report of the Department of Trade and Commerce, figures showing the volume of foreign trade in lumber and forest products. These, with others, have been submitted to you during the year, together with comparative statements of Canadian and United States exports to various countries of the world. It is hoped that these circulars are of interest and value to the trade, and if any member has any suggestion to make regarding this or other kindred subjects, it will be very gladly received and acted upon.

In connection with the recommendations contained in the report of the transportation committee, your secretary is of the opinion that the returns made to the Government by the railways should show the operating expenses incurred in freight traffic, as distinct from other operating expenses. The earnings of each class of traffic are shown separately, and it should be easily possible to distribute the operating expenses in a like manner.

Referring to the subject of membership, we have now an active membership of 81. In my report last year, I suggested the advisability of forming a committee of three to devise means for increasing the membership. Perhaps some action may be taken at this meeting in this regard.

Your secretary also begs to suggest to you the advisability of now organizing a collection department, more particularly with regard to the collection and settlement of claims against railways, etc., for overcharge in freight and so forth.

Another matter which has been suggested by Mr. D. H. McLennan, of Montreal, and which I think is becoming a very important one, is the question of collecting reliable data, in connection with the weights of various kinds of lumber, per thousand feet, both dry and green. At the present time, the only thing of the kind we have in Canada is the estimated weights of lumber, as per Canadian classification, published by the Canadian Freight Association. I urge this point for your very careful consideration.

Proposed Closing of Rideau Canal.

Your secretary, in his private capacity as a member of the Board of Trade of Ottawa, was appointed by that body to act on the joint committee of members of the Board of Trade, and of the City Council, of which His Worship, the Mayor, was chairman, to confer with Vice-President McNichol and other officials of the Canadian Pacific Railway, regarding the proposal to close the Rideau Canal in Ottawa, and thereby give the Canadian Pacific Railway access to the Central Station over their own tracks. The proposition is to construct a tunnel under the city, which would connect the main line west with the short line to Montreal, without having to go over the two bridges above and below the Chaudiere Falls and around through Hull. As the closing of the canal would forever prevent the shipments of lumber to Montreal from the very extensive yards of Mr. J. R. Booth, or, on the other hand, prevent the shipment of lumber from the mills, situate on the lower Ottawa River, via the Rideau Canal to Kingston, the proposition was not looked upon favorably. Apart from this feature of the case, there is the additional one that if the canal were closed, it might very easily, and undoubtedly would, be urged by the railways as a further evidence, that Ottawa was not a water competitive point, and on the grounds of public interest, the closing of the canal should be strongly objected to.

At the conclusion of this report a brief discussion ensued regarding the proposal to establish a collection department. It was the general opinion that under present conditions this would be too great an undertaking. No action, therefore, was taken.

The report of the treasurer was then presented. It showed that financially the Association was in a satisfactory condition.

Duty on Lumber From the United States.

The report of the executive committee, which was then presented, was as follows:—

Since the last annual meeting, your executive have met for the discussion of various topics in which the Association was vitally interested, and we have now to report on several matters which were specifically referred to your executive committee, at the last annual meeting.

The resolution passed by the British Columbia lumber associations, asking for certain duties on lumber, lath and shingles, coming in from the United States, which was adopted also by the Canadian Manufacturers' Association, was laid before the proper Minister, with the recommendation that this Association concurred fully therein. As you all know, the negotiations looking to the adjustment of the customs tariff between Canada and the United States recently terminated in Washington, and on January 26, the agreement arrived at between representatives of the two governments, was submitted concurrently to the Canadian Parliament and the United States Congress.

The effect of the reduction of the United States duty on lumber from Canada, made in August, 1909, was not very marked, but the increase of duty on shingles resulted as follows:—1910, 631,875,000 pieces, valued at $1,380,071; 1909, 852,091,000 pieces, valued at $2,003,776; 1908, 870,924,000 pieces, valued at $2,052,828.

Regarding the question of jumpers, the only means of getting relief would seem to be by having the Criminal Code amended in the various provinces, somewhat on the lines of the 1901 amendment to the Statutes of Ontario, as follows:—

> In case any person enters into an agreement under which he receives as an advance of wages, money, food, lodging or railway or steamboat ticket, to enable him to reach any place at which he has engaged to perform labor, work or other services, if such person thereafter without the consent of his employer leaves his employment before the money or cost of such food, lodging or transportation has been repaid, he shall on proof thereof before a Justice of the Peace be liable on summary conviction to a penalty not exceeding $25, and in default of payment of such penalty, to imprisonment in the common gaol of the county or district for a period not exceeding thirty days, as the Justice may direct.

This was repealed in 1904.

Uniform Grading of Lumber.

Our secretary has devoted considerable attention to this question, but it would appear as though there were insuperable obstacles to successfully accomplish uniformity in grading. We have on file the rules of grading adopted by the Spruce Manufacturers' Association of West Virginia, the inspection rules submitted to the National Hardwood Lumber Association at Louisville, Ky., June 9, 1910; suggested grading of white pine, Buffalo and Tonawanda, etc. If uniform grading could be adopted, it would undoubtedly eliminate many difficulties which arise in the lumber business, and would go a long way towards the accomplishment of the aims and objects contemplated in the following subject.

This Association is in receipt of communications from the American Lumber Trades Congress of Chicago, containing several amendments to the Code of Ethics, as adopted by the Congress at Chicago, on June 8, 1909. The suggested amendments are in line with the simplification and betterment of the Code of Ethics, which was adopted as above-mentioned. The purpose is to hold another meeting of the Congress, when these amendments will be submitted. Without committing this Association in any way, your secretary promised to lay the matter before this annual meeting. Intimately connected with this Code of Ethics is the question of arbitration. Your Association, as you are all aware, is committed to the principle of arbitration. See the Constitution, Section VI., Par. (b).

The questions of grading, terms, arbitration and, in fact, the acknowledgement of the principles embodied in the Code of Ethics, seem to your executive, to provide a working basis for the settlement of any questions that may arise between manufacturers and retailers. Care needs to be particularly observed in drawing the line of demarcation, between where the right of the one leaves off and that of the other begins, otherwise a charge might readily be laid that the observance of any particular rules were in contravention of the law governing restraint of trade, etc.

Transportation Committee's Report.

The Transportation Committee reported as follows:—

As is doubtless known to all members present, the application of this Association, protesting against the freight tariffs filed by the railways, which became effective May 1, 1908, has been disposed of by the Board of Railway Commissioners, by Orders Nos. 10.528 and 12,301, with judgment attached to the former and memo. attached to the latter.

The report then gave an outline of the principal events in connection with the application to the Board of Railway Commissioners, pointing out in the first place how completely in harmony with the claims of the shippers were the utterances of Chief Commissioner Mabee on the evidence in connection with domestic shipments. After quoting the principal remarks of the Chief Commissioner on this occasion, the report continued as follows:—

Subsequent to this, the railways had a hearing before the Board with a view of justifying the reasonableness of their rates. The result was Assistant Chief Commissioner Scott's judgment, concurred in by Commissioner Mills only, dismissing the application so far as domestic rates were concerned.

In the same order there was a ruling regarding export rates—practically granting our application.

These two rulings in the same order are entirely inconsistent.

When the railways filed export tariffs, they did not comply with the order of the Board, and your committee asked the Board to instruct them to do so. The result of this request was that the case was put down for another hearing on the export rates, and in consequence thereof, Order No. 12.301 was issued, providing as follows:—

> "It is ordered that the Canadian Pacific, the Grand Trunk, and the Canadian Northern Quebec Railway Companies, publish and file tariffs, to be made effective not later than the first day of January, 1911, reducing the export rates to Montreal on lumber from points in the Province of Quebec, north and east of the City of Montreal, so that the same difference shall exist between the present domestic rates on lumber to Montreal and the said rates for export as existed between the old domestic rates and the old rates for export."

This means that the Board simply abrogated the original order—the principle laid down in which was satisfactory to shippers. This last order also has the effect of permitting a further increase in the export rates of about ⅙ cent per 100 pounds over and above the rates at present in effect, from a number of points, and further brings about discrimination as between territories, which is contrary to the Railway Act, inasmuch as it sanctions export rates on less than 23 per cent., while over 77 per cent. of the actual shipments of lumber to Montreal for export, do not enjoy export rates which are lower than rates for domestic shipment.

By agreement between the parties, during the hearings before the Board, refund of all charges in excess of the ultimate rates which might possibly govern, was to be made by the railways on and after July 16, 1909. This is not ordering a refund; it is simply directing the railways to carry out an agreement arrived at between the parties.

The question also regarding the charges re increasing the minimum carload rates, has not been covered by the orders.

Review of the Orders to be Sought.

Under the rules and regulations of the Board, clause 19, we have the privilege of asking for a review within thirty days of the date of the last order. To enable this Association to determine what course to adopt under the circumstances, we asked the permission of the Board for an extension of the time in which to make a request for a review of the orders, to not later than February 15 next. This permission has been granted.

Apart entirely from a further reference to the Board of Railway Commissioners, we can, under the Railway Act, appeal direct to the Governor-in-Council.

Your committee is quite clear that the orders referred to, Nos. 10,528 and 12,301, conflict with one another, and establish the principle of discrimination, which is a violation of the Railway Act, and on this point alone, we believe that an appeal to the Governor-in-Council would prevail.

Proposed Railway Act Amendment.

As to the general proposition and the relative positions of shippers and carriers in this country, we are firmly of the opinion that the Railway Act should be amended. Your attention is called to the fact that the C.P.R. is reported, in the press, to be about to declare a dividend of 10 per cent. The stock of the C.P.R. has been quoted recently at 204, and it is further publicly announced that the railway will issue an additional $20,000,000 worth of stock. For your information, we quote from a brief which has been filed by the Illinois Manufacturers' Association before the Interstate Commerce Commission, relative to the proposed increase in freight rates in the United States:

> "A carrier is not entitled to capitalize that part of its assets given to it by the public.
>
> "A carrier is not entitled to capitalize the increase in value of the road brought about through lapse of time, commonly called the 'unearned investment.'
>
> "A carrier is not entitled to capitalize the value of the road as a going concern.
>
> "A railroad is not entitled to earn the same rate on the cost or value of its terminals as upon its main line, as terminal property is not self-sustaining and constantly increases in value. The burden, therefore, rests on the carrier to show what part of its basis is terminal property.
>
> "A carrier is not entitled to earn as much on money put back into its property from earnings as on other capital.
>
> "The reasonable return on whatever basis it is adopted, to which a carrier is entitled, is a sum not to exceed 6 per cent., and this sum represents everything to which the carrier is entitled."

The amendments to the Railway Act, which we would suggest, would be something on the following lines:—

> "5. Any special freight tariff of any transportation company, subject to its jurisdiction, which may hereafter be filed with the Board of Railway Commissioners, to which exception is taken by any person, company or other party interested, making formal protest, either before or after the effective date mentioned therein, against the adoption of said tariff, shall at the discretion of the Board be disallowed, until after such time as the Board shall determine, after hearing evidence produced for or against the adoption of such tariff. The Board may of its own volition, without protest or complaint on the part of others, disallow any such tariff with or without hearing evidence in support of or against same.
>
> "6. In any special tariff the rates contained in which are increased, the burden of proof,
>
> (a) that old rates are inadequate, unsatisfactory, or unworkable,
> (b) that a larger freight revenue is requisite and necessary, and the reasons therefor,
>
> shall be on the transportation company or companies, or its or their representative or representatives, filing such tariff."

We would also suggest that the Railway Act be amended so as to provide that in all cases where railways increase their capital stock, that the entire proceeds shall go into the treasury of the railway company, whether such stock is below or above par.

Your committee, therefore, are of the opinion that this Association should join with the Transportation Committee of the Board of Trade, Montreal, in asking for a review of the orders, so far as export rates are concerned, and that the whole question be left in their hands for whatever action they may deem desirable.

With regard to the car stake question, this matter has received very careful and constant attention of your committee. We have had many interviews with the Board of Railway Commissioners, and we are hoping that within a very short time we shall receive an order, which shall be satisfactory to the shipping interests of this country, and at the same time be fair to the railways.

A discussion then occurred upon the freight rate question, and it was agreed to proceed no further with the application for more equitable domestic rates. The secretary, however, was instructed to proceed with an application for a review of the orders of the Board in connection with the export rate. During this discussion the secretary pointed out that the rates were not based (as the railways had claimed) upon the mileage schedule of rates adopted in certain of the United States. In some cases, where this schedule gave the railroads the maximum rates, the figures had been used, but in others, where the rates in the schedule were not satisfactory to the railroads, higher rates had been adopted.

Mr. Tilston, transportation manager of the Montreal Board of Trade, appeared before the meeting and, upon request, expressed the feeling of that organization upon the subject, saying that while they were not in favor of going any further in connection with the domestic rates, they would give every assistance possible in seeking for more favorable export rates.

Report of Committee on Insurance.

Your Committee on Insurance reported as follows:—

It will be remembered that during the last annual meeting, the new Insurance Bill was at that time before Parliament, and that you authorized your committee to join with the Premium Payers' Committee in endeavoring to have the proposed bill so amended that it would admit of the continuance of the practice of placing insurance on lumber and sawmill property, with any British or foreign unlicensed insurance company or underwriters, or with those who reciprocally insure for protection only, and not for profit. Representatives of this Association were constant in their attendance before the Banking and Finance Committee of the Senate, and we are gratified to be able to say that the combined efforts of the insurance premium payers of Canada resulted in Clause 139 of the Act finally becoming adopted. It was a long, hard fight, but we believe the legislation, whilst it gives property holders in Canada freedom to place their insurance outside if they so desire, has not worked to the detriment of the companies licensed to do business in Canada.

In this connection your particular attention is drawn to paragraph two (2) of section 139 of the Act, which reads as follows:—

> 2. Every person so insuring property situated in Canada shall make a return to the Superintendent giving the location and a brief description of the property insured, the amount of the insurance, and whether insured in Lloyds or some similar association, or in mutuals, reciprocal or other class of insurers, each return to be made by delivering or mailing it in a registered letter addressed to the Superintendent not later than the first day of March in each year for the year ending on the preceding thirty-first day of December.

A full supply of these forms has been secured and will be sent out to all our members who have not received them direct from the Department of Insurance. We would urge upon our members the desirability of completing these forms and returning same to the Superintendent of Insurance not later than the first day of March next, for the calendar year ending thirty-first day of December last.

A letter was read from Mr. E. F. Perry, secretary of the National Wholesale Lumber Dealers' Association, inviting the Canadian Lumbermen's Association to send representatives to the annual meeting of the Association, which is to be held at Washington on March 1 and 2. The President, Lt.-Col. J. B. Miller, and Mr. Denis Murphy, of Ottawa, were chosen to represent the Association on that occasion.

Officers Re-Elected.

The election of directors for the ensuing year resulted in the old board being re-elected. At a subsequent meeting of the Directors, the appointment of executive officers resulted in the former officers being reappointed. The officers and Directors are as follows:—President, Lt.-Col. J. B. Miller, Toronto; Vice-Presidents, J. C. Browne, Ottawa; John Hendry, Vancouver; D. C. Cameron, Winnipeg; Alex. MacLaurin, Montreal; Secretary, Frank Hawkins, Ottawa; Treasurer, R. G. Cameron, Ottawa. Directors—Ontario: G. C. Edwards, Ottawa; J. B. Miller, Toronto; J. S. Gillies, Braeside, J. C. Browne, Ottawa; J. J. McFadden, Renfrew; H. K. Egan, Ottawa; W. C. Laidlaw, Toronto; Dwight J. Turner, Toronto; George Gordon, Cache Bay; W. H. Rowley, Ottawa; W. A. Firstbrook, Toronto; Quebec: D. H. McLennan, Montreal; Alex. MacLaurin, Montreal; Wm. Power, Montreal; British Columbia: John Hendry, Vancouver; Otto Lachmund, Arrowhead; A. D. McRae, Fraser Mills; Wm. McNeill, Vancouver; D. C. Cameron, Winnipeg, and Wm. Cowan, Prince Albert, Sask.

Committees were appointed as follows: Executive committee, J. B. Miller, Toronto; J. C. Browne, Ottawa; G. C. Edwards, Ottawa; W. C. Laidlaw, Toronto; Alex. MacLaurin, Montreal.

Committees on legislation—Dominion: Ward C. Hughson, Ottawa; J. C. Browne, Ottawa; Peter Whelen, Ottawa. Quebec: Wm. Power, Quebec; Alex. MacLaurin, Montreal; R. M. Beckett, Quebec. Ontario: W. D. Lummis, Toronto; W. A. Firstbrook, Toronto; H. J. Bartlett, Toronto. Western: John Hendry, Vancouver; A. D. McRae, Fraser Mills, B.C.; D. C. Cameron, Winnipeg.

Committee on insurance—J. C. Browne, Ottawa; H. K. Egan, Ottawa, and J. J. McFadden, Renfrew.

Lumbermen Enjoy Annual Banquet

Interesting Speeches Delivered by Senator Edwards and Others—Trade Relations with U. S. Vigorously Discussed

On the evening of February 7, the annual banquet of the Canadian Lumbermen's Association was held at the Laurentian Club, where a large number of lumbermen and their guests sat down to an excellent dinner. The president, Lt.-Col. J. B. Miller, presided. At the conclusion of the repast, the toast list was introduced by drinking the health of the King, after which the toast of "Canada" was proposed by Mr. Denis Murphy, Ottawa, who coupled it with the names of Mayor Hopewell, of Ottawa, and Mr. John F. Orde, K.C., solicitor for the Canadian Lumbermen's Association. Mr. Orde made a brief reply, and dealt forcibly with the reciprocity situation, expressing serious apprehension regarding the outcome of the proposed tariff arrangements. He feared that these arrangements might become the entering wedge in the weakening of our ties with the British Empire.

The only other toast was that to the "Trade," which was proposed by Mr. John Hendry, vice-president of the Association. Mr. Hendry made a few remarks relating to the reciprocity arrangement now under consideration between Canada and the United States. He did not think there was any great fear, if these arrangements were completed, that the trade of Canada would trend north and south, in such a manner as to be a menace to our national trade from east to west. He referred, by way of substantiating this belief, to the fact that Canada was already a strong manufacturing country, and that her manufacturing interests were spreading throughout all parts of the country. Winnipeg, for instance, had already become quite a manufacturing centre, and Calgary was following suit. He believed that the Pacific coast also would, in the future, become a great manufacturing country. This would come about inevitably with the growth of our population.

An Advocate of Free Trade.

Senator Edwards, who replied to the toast of the "Trade," made the most interesting speech of the evening. As was to be expected, he came out strongly in favor of unrestricted free trade between Canada and the United States. His remarks, although they were not entirely acceptable to the majority of the guests, were received with the utmost good feeling, causing much comment and continual entertainment. Speaking of the lumber trade, Senator Edwards said that it was certainly one of the most considerable industries in Canada: second, so far as our natural products were concerned, only to agriculture.

There were those, however, who thought the lumber trade would soon be at an end, and others who accused the lumbermen of having enormously diminished the forests of Canada, and with having been careless in their operaitons, to such an extent that they themselves were bringing about the end of the industry. He asserted, however, that, of all the people in Canada who were laboring for the preservation of the forests, the lumbermen stood first. That the lumbering industry should continue to be a great factor in Canadian industrial life was certainly a most important matter, not only on account of the industry itself, and of the many uses to which its produces were applied, but also for the sake of the continued maintenance of our water powers, which constituted one of the greatest of our natural resources. If our forests should be depleted, this great asset of water power would be seriously injured, and in many places it would be destroyed altogether. Fortunately, however, there had, within recent years, been established a Conservation Commission and a Forestry Association, whose work was now beginning to have a very wonderful effect upon the people of Canada. If to these instrumentalities, the assistance of the lumbermen were given for the preservation of the forests, as completely as it should be, it was safe to say that the lumbering industry of Canada would continue to a greater or less extent forever.

The Urgency of Conservation.

All countries were not so well off, in this respect, as Canada. For instance, our neighbors to the south of us possessed enormously more lumber than we did. The fact was that at the present rate of production and consumption, their forests would last at least twenty-five years. There were those who believed that after this, Canada could supply them. The truth was, however, that if the United States possessed no lumber to-day, and Canada had to supply them, we could only do it for about eight years. The United States consumed each year forty billion feet of lumber. It was estimated that Canada possessed sufficient only to supply this product for eight years. This question, therefore, was a very serious one, both for Canada and for the United States, and it behooved every good citizen of the North American continent to aid in the preservation of this very valuable and very necessary natural resource.

Senator Edwards then took up the question of reciprocity, dealing with it vigorously. He had never felt that there was any danger in a course which would bring greater happiness and contentment to the people, nor did he believe that by increasing our prosperity we would be endangering our loyalty. On the other hand, he believed that if we restricted the rights of the people, we would create disloyalty. He believed in the greatest possible liberty of trade. He wanted liberty to purchase from the Hindoo or the Chinese, if these people could produce best the articles which he needed, and he wanted to sell to the people who could give him the best value for anything he had to offer. He did not believed that there was any foundation for the fear that, with freedom of trade between Canada and the United States, there would come about a decrease in the operations of Canadian railroads, eastward and westward. On the other hand, he believed that the eastward and the westward trade of Canada would be greately increased. He considered that the reciprocity arrangement was the best move that had ever been made, so far as Canada was concerned, for the benefit of the Empire.

Senator Edwards dwelt upon this theme for some time, and concluded by asserting that he did not believe that if the duty was removed from lumber entering the United States, any important results would occur. He did not believe it would increase the exports of Canadian lumber to that country. He believed the lumbermen would probably benefit, but he felt sure that the manufacturers of lumber in Canada would not be foolish enough to increase their cut materially. The wise lumbermen of Canada, indeed, would diminish their cutting.

Before resuming his seat, Senator Edwards, in a few words, proposed a toast to the United States, calling upon Hon. J. G. Foster, Consul-General for the United States, and R. Patchen, of the New York Herald, who made brief replies.

Permanency of the Lumber Industry.

The chairman then proposed an additional toast to the Forestry Association, calling upon Mr. R. H. Campbell, Superintendent of the Forestry Branch of the Department of the Interior, to reply. Mr. Campbell said that many people in Canada had an impression that the lumber industry was disappearing. They were, however, badly mistaken, and so long as we had forests in the country we would have lumbering. The lumber industry of Canada had had a great share in the development of the country. It was an index of the growing spirit of unity throughout Canada, that such an association as the Canadian Lumbermen's Association had been formed. Its principal object was a most commendable one, viz.: to study the great questions of the trade, and to assist in the wise development of the Canadian lumbering industry. The lumbering industry of Canada was of great importance to the country, not only on account of the extensive wealth which it produced, but also because it developed the best and the strongest type of citizen. The lumberman was physically strong and mentally alert, and his contribution to the development of the country was of the utmost importance. The greatest question in any country was the character of its citizenship, and this was shown clearly by the method in which the citizens dealt with the natural resources of the country.

If we wished to prevent our forests from being burned up and destroyed year after year, we must not only secure the interest of our lumbermen, but we must, in addition, educate the people generally to the importance of this question. The Forestry Department was endeavoring to do its share in the work of educating the people, and he hoped that the lumbermen and the Forestry Association would always work, hand in hand, for the promotion of this great ideal.

An interesting programme of music was contributed by several of the guests.

The banquet was then brought to a close by the singing of "God Save the King."

Forestry Association Annual Business Meeting

The annual business meeting of the Canadian Forestry Association was held at Ottawa on February 7, in the Council Chamber of the City Hall. The chair was occupied by the retiring president, Hon. Senator Edwards, one of the leading lumbermen of the Ottawa Valley, and among those present were Herbert M. Price of Quebec City, Hiram Robinson and Denis Murphy of Ottawa, R. H. Campbell, Dominion Superintendent of Forestry; Alexander MacLaurin, Montreal, and John Hendry, ex-president of the Canadian Manufacturers' Association, and one of the largest operators in British Columbia. Owing to the blizzard which had been raging for two days in Canada, a number of other prominent men wired that they were stalled in the snow at various points.

The reports presented showed that the association was in a flourishing condition, and it was decided to press on the work of organizing conventions, having illustrated lectures delivered and spreading literature. The work of the recent convention at Quebec was reviewed, and the incoming executive was advised to hold the next large convention in Winnipeg in the winter of 1911-12. The number of directors was increased from twenty-one to thirty, and the following added to the directorate to complete this number and fill vacancies: Senator Edwards, Msgr. O. E. Mathieu, Dean of Laval University, Quebec; Wm. Power. Wm. Price, M.P., and Lt.-Col. J. W. Harkom of Melbourne, Que; Denis Murphy and C. Jackson Booth, of Ottawa, and C. E. E. Ussher, general passenger traffic manager of the Canadian Pacific Railway. Montreal. Mr. George Y. Chown, registrar of Queen's University, Kingston, Ont., former vice-president, was elected president, and Mr. John Hendry. Vancouver, vice-president.

The report of the Board of Directors, which was read and adopted, showed that the association had made good progress during the year, both in its work and in the enlargement of its membership. The membership list now totals 2.703, which is an increase of 232 for the year. This excellent showing is made in spite of the fact that the list had been carefully revised during the year, and 504 names struck off the list because of death or non-payment of fees.

Responsibility for Measure—An Unjust Act

Editor "Canada Lumberman:" In your issue of January 1st you have an article under the following heading: "Deficiency in Measure—The New Law." A great deal of feeling has been engendered in consequence of this Act. How it ever passed the House of Commons passes our comprehension. A nation who cannot by any stretch of imagination be described as a ship-owning nation, thus legislates exclusively in favor of ship-owners, while, at the same time, legislating against their own lumber shippers, and all the manufacturers throughout the country. This is no exaggeration, inasmuch as it will entail on the manufacturers and shippers, and their agents on this side, no end of trouble and expense.

There were undoubtedly under the old regime frequent claims against ship-owners for shortage, some of which claims might not have been attributable to losses off deck, or otherwise constituting a claim on the underwriters, but the ships, when entertaining a freight, could very well—and did—in the rate of freight, cover themselves by making provision against any such problematic contingency. As it is now, the shippers will be called upon to reimburse buyers for shortages over which they—the shippers—cannot have any possible control, whereas the ship during discharge might very well have had control, by the exercise of supervision, which the shippers, or their agents, could not possibly have unless they had representatives to meet all vessels—whether steam or sail—at the port of discharge, and keep watch during the whole course of discharge—an operation which would be practically impossible, to say nothing of the very heavy expense.

For our part, we never knew of legislation undertaken with such a light heart, and apparently without much regard to consequences.

How long is this iniquitious condition in the new act to be allowed to stand without repeal?

Yours faithfully,
H. W. Lightburne & Co.

Increased Cut from Dominion Lands

Annual Report of Department of Interior Shows Increase in Timber Revenue of $57,585—Ouput Nearly 250,000,000 Feet

The operations of manufacturers of lumber owning licenses and permits to cut timber on Dominion lands are set forth for the fiscal year ending March 31, 1910, in the last annual report of the Department of the Interior, which has recently been issued. The operations show a marked increase of activity in timber, the amount derived from royalty alone being $57,585.52 in excess of that received during the preceding fiscal year.

The average ruling price of lumber during the year in the different agencies was as follows:—Calgary, $14.81; Edmonton, $16; Prince Albert. $18.47; Winnipeg, $14.63; New Westminster, $14.15. The area of timbered lands held under license and permit in the Provinces of Manitoba, Saskatchewan and Alberta, and the Northwest Terirtories and the railway belt in British Columbia. totaled 7.905.98 square miles under license, and 827 under permit. This showed a decrease in land under license of 384 square miles, and in land under permit of 686 square miles.

The output of lumber at the mills operating in timber cut upon Dominion lands, during the year under review, amounted to 240,408,390 feet, board measure, which amount exceeds that of the previous year by 58,598.930 feet. The demand for lumber throughout the West was at no previous time more active. The cut of logs upon Dominion lands was between 3,500.000 and 4.000,000 pieces. The millmen in British Columbia who had timber areas under Dominion license continued to draw their supply of logs chiefly from their provincial holdings, due in a large measure to the high ground rent charged by the province, which renders these lands more expensive to carry than those of the Dominion, upon which a much lighter rental is charged. The total amount of lumber marketed in the Provinces of Manitoba, Saskatchewan and Alberta. during the year, was 943.843 098 feet, of which amount about 500.000.000 was brought in from British Columbia. The total shipments from the mountain mills during the year were 324,829,326 feet. The estimated quantity of logs on hand at these mills at commencement of 1910 sawing season was 350.000 000 pieces. The selling price of lumber of the different kinds was higher than in the previous year by from $2 to $4 per thousand feet.

The present mode of disposing of Dominion timber under license, which came into force on September 1, 1908, is reported to have proved highly satisfactory. By it the Government secures the market value for the standing timber upon the tract sold.

The Crown Timber Agent at Winnipeg reports the selling price of the different classes of lumber, during the year, together with that of the year previous, as follows:—

Pine, cedar and fir—	1908-9.	1909-10.
Dimension lumber	$20.00 to $27.00	$22.00 to $28.00
Fir for interior finishing	40.00 to 50.00	40.00 to 50 00
Flooring, siding and ceiling	33.00 to 40.00	33.00 to 40.00
Ship lap and common boards	20.00 to 23.00	20.00 to 25.00
Spruce—		
Dimension lumber	18 00 to 25.00	19.00 to 27.00
Siding, flooring and ceiling	23.00 to 28.00	23 00 to 28 00
Ship lap and common boards	18.00 to 24.00	19.00 to 25.00
Lath	3.75 to 5.00	3.75 to 5.00
Shingles	2.70 to 3.00	3.00 to 3.50

The cut of logs from Dominion lands during the winter of 1909-10 exceeded 100,000.000 feet, upwards of 25 per cent. larger than in the year previous. Owing to the early break up of the winter, however, not more than 80,000,000 feet was got out of the woods. This was expected to cause a shortage of supply which would result in an advance of the price of lumber of from $4 to $6 per thousand feet.

A good concatenation of Hoo-Hoo was held in Moose Jaw on February 2. Under the direction of Snark W. W. Davidson, several new members were initiated. At the conclusion of the ceremony the members adjourned to the Moose Jaw Dining Hall, where a banquet was held, followed by an entertainment.

Nova Scotia's Trade During 1910

Conditions Which Led to a Moderate Amount of Business Only—Small Profits Secured—Outlook for 1911

Halifax, N. S., Feb. 9.—The year 1910 will not be remembered by lumber operators in general throughout the Province of Nova Scotia as being a particularly successful one. A combination of circumstances tended to increase the cost of production, and in other ways to produce poor results. Unusually mild weather prevailed during the earlier part of the winter, and, as a whole, the season was a poor one for hauling logs or sawn stock throughout the Province, increasing the cost of logging and hauling by a good dollar, to the average operator and his contractors.

The opening of the year also found the markets all well stocked, and dealers with no great inclination to purchase. English buyers who purchased Nova Scotia deals paid about $14 to $14.50 f.o.b. for the same, while St. John and North of New Brunswick stock sold as high as $16 f.o.b., 50 per cent. 7 and 8, 50 per cent. 9 and up.

Fortunately the English market, to which the bulk of the provincial lumber goes, showed the least variation of any of our markets during 1910, and most of the dealers came out fairly well in their purchases.

Buyers of American stocks were not so fortunate. A number of dealers took a flyer on the markets, paying high prices for hemlock and lath, considering the market at time of delivery of the stock. Fourteen dollars f.o.b. was paid in many cases for fair hemlock schedules, and $2.50 f.o.b. for spruce lath, which prices were readily netted by anyone shipping stocks on the market up to June, providing they obtained reasonable freights. After that the market went off steadily, and as yet has shown no sign of recovery, prices being from $3 to $4 below the last spring market on lumber, and 40 to 50 cents lower on lath. For cargoes shipped early, some good prices were realized, spruce random, not sized, 35 to 40 per cent., 8 and up wide, netting over $16. Hemlock running a good percentage of 10 and 20 foot lengths, brought $14 to $14.50, and spruce laths $2.50 to $2.60. After June, however, the markets yielded no such prices, and came down to the level above mentioned.

The South American market, while not suffering any changes such as this, did not hold the spring prices, and a number of cargoes are being held over by the buyers.

Shipments to the United Kingdom were somewhat in excess of last year, the quantity reported being 110,000,000.

New York imported 49,439,947 feet lumber and 36,407,300 pieces of lath from Nova Scotia.

Of the lumber imports, 30,512,631 feet was hemlock, 14,759,682 feet spruce, and 4,167,666 feet pine.

Bridgewater, with 17,629,911 feet, leads the exporting list to New York, while Windsor, with 9,939,832 feet, is second, and Halifax, with 3,167,000 feet, is third.

Statistics of the Boston, Sound ports and Philadelphia are difficult to get, but would not run over 15,000,000 from Nova Scotia, if they reached this figure.

Statistics of the shipments to the West Indies and South America are not available, but are reported to be somewhat less than last year.

The total export from Nova Scotia for 1910 was about 290,000,000, which, considering the poor winter of 1909-10, was much more than expected, and perhaps much more than was good for the market.

It is undoubtedly true that much of the stock that went forward last season was shipped at very little profit, if any, to the manufacturer, and, on the other hand, one of the New York buying houses that stands well up on the list of shipments from Nova Scotia, admits that they dropped considerable money on their purchases in Nova Scotia. Never since the bad season of 1907 has the New York market been given a chance to fully recover, and, not unless shipments decline, or there is a considerable change in general conditions, will the market return to high level. It looks as if the simplest way to remedy this would be to decrease shipments.

One frequently hears the statement that Nova Scotia exports are so small as not to affect any market, but 50,000,000 of lumber exported to New York and the adjacent country has a very material affect on this market, and New York practically controls the United States markets to which Nova Scotia exports.

New Brunswick exports to New York by water were 28,079,169 feet, and 187,222,500 pieces lath, this being practically all spruce. Apart from this there were large shipments to the Sound ports and Boston, on which statistics are not available.

Shipments to New York from Quebec by water were 5,662,807 feet of lumber and 20,869,400 pieces lath, all of which was spruce.

Consignment business in Nova Scotia seems to be on the increase, at least so far as the business with which the writer is personally connected is concerned. No American firms have any objection to buying if sufficient margin is obtained, but the cost of survey, uncertainty of freight and incidental expenses make a much larger margin necessary than handling on consignment. One good feature about Nova Scotia stock is the better quality of manufacture than formerly.

During the past season, in the writer's experience, not more than an average of 1 to 2 per cent. of culls were found by the American surveyors, and shipments show an excess more frequently than a shortage.

The outlook for 1911 is not good by any means. Should weather conditions continue as they are, and shipments be small, it would probably be an advantage to shippers in general in the long run, and though there may be an unlooked-for change, the safest stand would be to go slowly for this year at least.

Nepisiguit Lumber Co., Reported in Difficulties

It is reported that Justice McLeod, of St. John, N. B., granted an order for the winding up of the Nepisiguit Lumber Co., of Bathurst, on the petition of the Sherman Lumber Co., of Potsdam, N.Y. George Gilbert, lawyer, and Edward P. McKay, manager of the Bank of Montreal at Bathurst, were appointed provisional liquidators. Shareholders to the extent of $225,000 and creditors for $12,000 were represented at the meeting. The Bank of Montreal is advancing the money to get this year's cut out of the woods.

East Canada Power and Pulp Company's Plans

Plans have been prepared for the new ground wood mill of the East Canada Power and Pulp Company, Limited, which is to be located at Nairn Falls, five miles from Murray Bay, on the line of the Quebec and Saguenay Railway. The hydraulic development will produce approximately 10,000 h.p. The dam to be erected is of the Ransom hollow type and the head will be 65 feet. The pen stocks are to be erected by Walsh's Holyoke Boiler Works, who put in the pen stocks for the Anglo Newfoundland plant at Grand Falls. The wheels are to be furnished by the S. Morgan Smith Company. Twelve grinders, built by the Holyoke Machine Company, will be installed in three lines, each line to have 2,400 h.p. The grinders will take wood 30 inches in length, and will have a capacity of eight to nine tons a day dry weight.

The wet-machines and save-alls are to be built by the Sherbrooke Machine Company, and the press outfit by the Canadian Boomer & Boshert Press Company. Quiller & Stubbs centrifugal screens are to be used, which will be manufactured by the Waterous Machine Company, of Brantford. The machinery for the cutting-up mill will be built by Ryther & Pringle, and the wood-room will be equipped with a combination of Green Bay barkers and Wytham automatic barkers, with the Lombard & Baldwin attachments.

The railway from tide-water to the mill will be completed by July 15th, 1911, and it is expected that the mill will be ready for operating by October 1st. The Bishop Construction Company, of Montreal, have the general contract, and also the contract for the branch of the railroad.

The East Canada Power & Pulp Company have taken over the limits of the Murray Bay Lumber & Pulp Company, which contain a perpetual supply of spruce, and the property of the Labrador Power Company, which handles the franchises for furnishing light and power to the villages of Murray Bay, Point a Pic, Cap a l'Aigle, and St. Irenee.

The engineer in charge is Mr. Geo. F. Hardy, of New York City, and the intention of the company is to erect a plant which will incorporate the most advanced Swedish and Canadian practises in the manufacture of ground wood. The officers of the company are: President, Rodolph Forget, of Montreal; Vice-president, Chas. W. Tooke, of Syracuse; Secretary-Treasurer, L. C. Haskell, of Montreal.

S. P. Musson, Son & Co., Barbados, report as follows under recent date: Lumberstuffs.—White Pine—no arrivals during the fortnight, but a cargo which we have sold to arrive is now about due. Market is good, and a couple of cargoes would sell well. Spruce—the only arrival has been a small lot of 38 M. feet ex Schr. "Pilgrim" from Gaspe, of rather indifferent quality. This shipment was divided into two small lots of 22 M. feet and 18 M. feet, former of which sold at $19.50, and latter at $20.02. Shipping quality is in good demand, and we recommend consignments. Pitch Pine—The Trn. Schr. "J. L. Nelson" arrived from Scranton on the 15th inst. with 218,500 feet, all heart, which had been sold to arrive some time ago, and we ourselves have a cargo on the way, also sold to arrive. Shingles—no arrivals of Long Gaspe. The "Pilgrim" brought down an assorted cargo of 400,000 laying, which were sold at the following prices:—120 M. No. 1 cedar laying at $1.87; 100 M. spruce laying at $1.93; 100 M. second clears at $2.77; 80 M. clear whites at $2.60.

Lumber exports from Halifax, N. S., to United Kingdom ports during 1910 totalled 51,965,909 superficial feet.

Convention of Mountain Lumbermen

Annual Meeting Held at Nelson B.C. — Reciprocity Condemned by Resolution—Otis Staples Elected President

The annual convention of the Mountain Lumber Manufacturers' Association was held in Nelson, B.C., on Jan. 30, and was one of the most important, as well as one of the best attended conventions in the history of the association.

Mr. Otis Staples, of Wycliffe, B.C., vice-president of the Association for the past year, was elected president; F. E. Sine was elected vice-president, and W. A. Anstie was re-elected secretary.

A strong resolution was adopted condemning the reciprocal tariff agreement with the United States, not only so far as lumber was concerned, but on all commodities, and particularly on fruit and farm produce.

A resolution was adopted drawing to the attention of the Provinial Government the disparity in timber license rentals exacted in the interior as against the coast. It was shown that the average stand of timber in the interior was only about one-quarter that at the coast, while the rentals on interior timber were $115 per mile, those at the coast being $140 per mile. Taking into consideration the inferior quality of interior timber, owing to the smaller growth, this was considered unfair, and the Government, in framing its new forestry legislation, was asked to place these rentals upon a more equitable basis.

Another resolution adopted called the attention of the Government to the fact that, contrary to the statutes, a large amount of timber was being removed from mineral claims and placed upon the market.

The association strongly endorsed a memorial which a deputation presented to Sir Wilfrid Laurier on Feb. 9, complaining of the policy of the Department of the Interior in entertaining applications from settlers for land included in timber berths. It is set forth that these applications, generally speaking, are made, not for bona fide settlement, but for the purpose of obtaining the timber, which very often is offered to the original owner for sale. The notice which operators are given, to remove the timber on the sections to be withdrawn, is usually so short as to make it utterly impracticable to comply with the order, and the timber has to be sacrificed. The injustice to the people who have invested their money in these timber berths and erected immense plans in the expectation of having an adequate timber supply is obvious, and it is hoped, when the matter is set forth in proper light, that the Government will adopt a more reasonable policy, in line with the well-known principles of conservation for which Sir Wilfrid Laurier has repeatedly pronounced.

It was decided to retain the headquarters of the association in Nelson, and it is probable that this point will be the permanent headquarters.

Speaking after the meeting, W. A. Anstie said: "While 1910 was, from the standpoint of production, the best year in the history of the mountain industry, we having exceeded 427,000,000 feet, still the results have not been satisfying to our people, not owing to the fact that the Canadian market could not take the lumber, but because we were forced to meet ruinous competition from the American manufacturers of the Western States. It is well known that the mountain manufacturers produce 85 per cent. common lumber, and it is equally well known to those conversant with the lumber trade of the West that the Western States are continually glutted with over-production of this same class of low-grade lumber. The consequence is that, having no protection, we have been forced to meet competition at ruinously low prices, considering the high and increasing cost of producing lumber in this province. As an instance of the conditions existing in the Western States, at the present time quotations are being made for lumber from mills in that territory at prices less than the cost of logs to our producers.

"The outlook for 1911 is, of course, good, but to what extent the lumber manufacturers of this district will share will depend upon the improvement of conditions in the United States, and the relief, if any, which the Government at Ottawa may see fit to extend to the only unprotected industry in Canada."

In the evening a banquet to the lumbermen was tendered by the Board of Trade at the Strathcona Hotel.

B.C. Wants Reciprocity in Shingles

Great interest is being displayed among the lumber and shingle manufacturing interests of Vancouver, B.C., regarding the effect which the reciprocity agreement between Canada and the United States will have on the industries in which they are engaged. A telegram has been sent to Ottawa by the British Columbia Lumber and Shingle Association asking for information as to the exact standing of the trade in respect to the reciprocity arrangement. It is understood that the present practically prohibitive tariff on shingles entering the United States of 50 cents per thousand is to be reduced to 30 cents. It seems to be the concensus of opinion among the lumber and shingle manufacturers of Vancouver that if any duty is imposed on these products, it should be equal on both sides of the line, and there is a strong sentiment in favor of establishing absolute free trade so far as shingles are concerned. Manufacturers of Vancouver express no fear about being able to compete with their American neighbors, and they further state that a much higher grade of shingles is manufactured in Canada than in the United States, for the reason that the highest grade cedar there is manufactured into lumber products to meet a demand which does not exist on this side of the line at the present time, and that therefore the higher grade Canadian shingles would soon make a name for themselves among users of high-grade materials.

To Protect B. C Forests from Fire

As a result of representations made to the Dominion Board of Railway Commissioners by the Government of British Columbia, the Commissioners are considering the question of making regulations for the protection of the forests of the Dominion from fires along the railway lines. Mr. James Mills, of the Board, has recently secured from Mr. J. L. Englehart, chairman of the Temiskaming & Northern Ontario Railway, full details of the system of forest protection followed on the Government road, a system which is said to be far in advance of the provisions against forest loss by fire made by other railways. Practically every man on the T. & N. O. Railway is on the watch for fires. The section men, who are constantly up and down the line on the light one-man hand cars of the T. & N. O., are always on the lookout, and the crews on the trains have instructions, upon noticing a fire anywhere, to stop at the first point from which they can send a warning to the fire rangers and section hands. Added to this, the T. & N. O. has on all its engines a finer screen than the law requires. In recent years very few fires have occurred along the line, and the only serious one was not traceable to the railway.

B. C. Log Scale Orders Rescinded

The British Columbia Government has rescinded its order enforcing the B.C. log scale throughout the entire province. The provincial application of this rule will therefore be postponed, probably for another year. The position taken by the lumber manufacturers of the interior of the province in respect to an official log scale is that the Doyle scale, while it shows a nominal over-run which allows an apparent advantage to mountain operators, is really offset by other disadvantages under which they operate, as compared with their more favored competitors at the coast. Pending further investigation, the interior operators are permitted to use the Doyle scale for the payment of royalty.

The Canada Lumberman has received a copy of the "Okay" Lumber and Log Code, published by Wm. Rider & Son, Ltd., of 164 Aldersgate Street, London, E. C., and 18 Warren Street, New York. The code is specially compiled for merchants, shippers, agents, etc. The compilation has been carreid out by Mr. T. W. Rayment. The code is intended for the transatlantic export trade, and will be found equally useful for the pine and spruce trades as for hardwoods and other lumbers. It is constructed on a new principle, and the publishers claim that by its use a saving of from 60 to 70 per cent. can be effected on messages as compared with cabling by many of the codes at present in use. The book is strongly and handsomely bound in limp leather, and is sold in America at $8.00 and in the United Kingdom at one guinea and a half.

Because the contract between the Alberta Lumber Co. and Mr. A. H. Cole, Jr., in which the latter agreed to supply the former with 5,000,000 shingles, did not contain a clause (barring accidents), Mr. Justice Clement awarded the Alberta Lumber Co. $1,298.50 damages in the Supreme Court yesterday. Last spring the shingle mill owned and operated by Mr. Cole was destroyed by fire after he had only delivered 500,000 of the contract figure. The lumber company sued him yesterday for $2,000 damages, as they were compelled to purchase from another firm at a higher figure than the contract price.

The Lumber Mutual Fire Insurance Company, of Boston, Mass., in their financial statement for the year ending Dec. 31, 1910, show a net cash surplus of $413,130.63. The total assets of the company amount to $1,647,167.36. During 1910, the losses paid amounted to $162,640.62, and the dividends paid to policy holders amounted to $137,475.29. There was a gain in the net cash surplus for the year of $25,407.90. Payments from 1895 to 1910, inclusive, amount to $763,097.86 for losses paid to policy holders, and $653,149.09 for dividends paid to policy holders. The rate of dividend to policy holders on terminating policies continues at 40 per cent.

The Making of Hardwood Mantels

Rapid Progress which has been Made in the Manufacture of this Line of Product During Recent Years—By G. D. Crain, Jr.

There are few industries which have been making more rapid strides of late years than the wooden mantel manufacturing interests. The great vogue of the bungalow, which demands the wooden mantel of the craftsman style, and the fact that in such buildings open fireplaces are essential in carrying out the general scheme of things, have done much to stimulate the business, which is, of course, one of the most important trades consuming hardwoods.

For a while the wooden mantel business looked as if it were on the verge of collapse, because the brick mantel, as well as the elaborate tile affair, was in great demand for a few seasons. The fact that it was difficult to secure proper harmony when any material other than wood was used in the construction of the mantel, did much to cause the wooden mantel to regain its popularity, and now the manufacturers report a heavier demand than ever before in their history.

Another contributing factor of recent years has been the change in the type of apartment houses which have been going up. When these structures were first built, steam heat was, of course, provided, and the owner thought it unnecessary to put in an open fireplace. After a while, though, the occupants of the apartments learned that they were missing something which the comfort of having steam heat did not altogether atone for. They wanted fires they could look at and be cheered by, and the result has been that every apartment of any pretensions has at least one room which is fitted with a beautiful mantel. That, too, is something the mantel man has been able to rejoice at.

While oak is the commodity which is consumed in the largest quantity by the mantel trade, a good deal of birch and poplar are also used. In addition to this, a large volume of veneer finds it way into the mantels, both mahogany and quartered-oak stock being used. The following figures on the trade in the United States are from an unusually authoritative source, showing the annual consumption of the various items: Quartered oak, red and white, 5,000,000 to 6,000,000 feet; plain oak, 8,000,000 to 10,000,000 feet; birch, 5,000,000 to 6,000,000 feet; poplar, 2,000,000 to 3,000,000 feet; mahogany veneers, 5,000,000 to 6,000,000 feet; quartered-oak veneers, 5,000,000 to 6,000,000 feet. Thus it would appear that in the twenty principal plants upon whose operations these figures are based, there is used every year from 20,000,000 to 25,000,000 feet of high-grade hardwood lumber, and from 10,000,000 to 12,000,000 feet of veneers; and with the trade growing as it is, there is no reason to doubt that still greater consumption of high-grade lumber will be recorded in the immediate future.

While a good many mantels of the craftsman type used in bungalows are of solid wood, practically all the birch used is veneered with mahogany, the columns and shelves especially being treated in this way. The veneers, as a rule, are bought, few of the mantel manufacturers caring to go to the trouble and expense of having their own veneer mills.

Dry Stock an Absolute Necessity.

In the mantel manufacturing trade, as nowhere else, is the demand for dry stock emphatic. As a rule, lumber that has been seasoned for at least a year is specified, and when it is being prepared for the factory it is dry-kilned for at least two weeks, the temperature it is subjected to during that period ranging from 165 to 170 degrees.

The reason why "bone-dryness" is essential in the case of mantels especially, is that they are attached permanently to the walls of buildings, and usually to outside walls. Usually, also, the buildings are new, and therefore contain a lot of moisture. If the mantels were not thoroughly seasoned, moisture would be absorbed and the glue joints would become loose and the mantel lose its adjustment.

After the lumber intended for use in the mantel factory comes from the kiln, it is run through the planer, one face being thus exposed that the figure may be seen and an idea of the proper use of that particular board gained. It is then cut into the proper lengths, and the figures matched up as nearly as possible. It is ripped to the proper widths, run through the planers, and is then ready for the moulders and sanders. After it has passed these machines, the mantel proper is put together. Labor-saving devices to reduce the amount of hand work necessary are being constantly introduced, but it is admitted that there is still a tremendous amount of such labor necessary, especially in the finishing process.

Staining and Filling.

After the mantel has been completed, as far as its actual construction is concerned, it is stained and then filled, thirty-six hours being allowed for the filler to dry and for the pores to absorb it. It is then sanded and a flint filler used on it. After standing forty-eight hours, it is sanded to a smooth finish, and the first coat of varnish applied. Three coats of varnish are put on, and the mantel is sanded after each coat. After the last coat has thoroughly crystallized (varnish doesn't "dry"), which takes from six to ten days, it is rubbed down by hand, water and pumice-stone being used to get the proper lustre, and then "sweats out" for twenty-four hours. The highly prized "French polish," which is gained by rubbing with the palm of the hand, is then finally put on if desired, while the dull finish which is now in vogue is secured by rubbing the mantel off with oil after it has been gone over with pumice-stone.

The fact that great care has been taken and much labor expended in securing the necessary finish, makes it necessary that the mantel be packed for shipment with an unusual degree of care. This is where the lumberman comes in for another share of the business. It is estimated that for crating and core lumber—the mantel is built up on a core of low-grade lumber, which rests against the wall—fully 10,000,000 feet of chestnut and pine are used. The grade usually required is No. 2 and 3 common, strips being specified for crating purposes.

So much attention has been paid of late years to the beautifying of homes, and so much money is now expended, compared with former years, in securing the desired effects, that a larger number of designs are used in the manufacture of mantels than would have been thought possible ten years ago. Regular architectural designs are followed in making plans of mantels, and the style varies greatly. As indicated, the simple craftsman mantel is in great demand for the popular bungalow, which is being built in such great number at present, while mantels following classic lines, with Ionic or Doric columns, are in demand for larger residences.—The Wood-Worker.

The Importance of Skilful Re-Sawing

It is not out of the way to mention that in the earlier days of band re-saws it was feared that efforts to reduce the kerf too small would result in the "snaking" of the saw blade to such an extent that there would be no real economy, for the variations in thickness caused by the irregularity would have to be dressed away at the planer, and thus there would be more loss than in using a heavier saw that would run straight. This was an early trouble that was more in the imagination than anywhere else, and even where it did actually exist it is now being left behind, by reason of a better knowledge in respect of the care of band-saw blades, and we are finding that, along with the reduction of the amount of kerf, we are also attaining a higher degree of perfection in band-saw work. The two really go hand in hand. The man that builds a machine, if he designs it for finer work, does his building better and more scientifically. The operator gets educated up to the same high standard, so that the natural result, where the plan is carried out properly, is for finer work and better and smoother sawing to be done with the machines and saws that make the smallest kerf. This gives us not only a saving of saw dust, but economy in timber on another count, that of making it unnecessary to dress away in order to produce a perfectly smooth surface, which brings us rapidly to the point where success in the business consists in the art of re-sawing. It is those people who are in the best position to re-saw timber, and get the most out of it with the least waste, that stand the best show of making a profit out of the business. In other words, a mill properly equipped with a high-grade resaw may get two boards, or even three, of certain thicknesses; whereas the man with an indifferent equipment that makes too much sawdust or the saw dodges about in cutting, would have to buy the timber cut to special order a little thicker than the standard. And this extra cost would eat up his profits when in competition.

The subject of the conversion of square logs, flitches, deals, and the like, into boards of uniform thickness, by means of the band saw, is unquestionably one which has come in for a great deal of careful consideration during the past few years, while there are box makers of the keen go-ahead type who are prepared to assert that the band saw may be used in the box and case business more economically than the circular saw bench.

Lumbermen all over New Brunswick felt considerably relieved to see the snow that fell during the last days of January. It had been feared that much of the lumber cut would have to remain in the woods. From now on everyone will be busy hauling, and the most will be made of the opportunity offered by the sleighing.

The Retail Dealer and His Problems

Toronto Retailers' Meeting – A Straight Talk

Toronto Retailers' Annual Meeting

At the annual meeting of the Lumber Dealers' Section of The Retail Merchants' Association of Canada, Toronto branch, which was held in the board rooms, 21 Richmond Street West, Toronto, on Tuesday evening, January 31, 1911, Mr. G. W. Booth occupied the chair. The treasurer, Mr. W. J. Hetherington, reported that after the expenses had been paid, there was a surplus to the credit of the association. The election of officers resulted as follows:—Chairman, G. G. Miles; first vice-chairman, G. W. Boake; second vice-chairman, W. C. Irvin; treasurer, W. J. Hetherington; secretary, E. T. Rathbone. Mr. G. W. Booth was chosen as representative at the Ontario Provincial Convention, to be held in Guelph on February 28, 1911. A hearty vote of thanks was tendered to Mr. Booth for the manner in which he had presided over the meetings during the past year, and the great interest that he had taken in an endeavor to place the lumber trade upon a higher plane.

The second Thursday in each month was fixed for the regular monthly meetings of the section. Any retail lumber dealer visiting Toronto at that date will be welcome to attend the meeting.

A Straight Talk to Retailers

By A. E. Watts

You suffer under many disabilities, for which you blame us as manufacturers, and very justly so, but at the same time the remedy is in your own hands, provided you will think! You have lots of time for that. It may be a painful operation—but try it.

The millman has had to think so much that his thinker is so tired or worn out, and his reflective capacity, owing to its environment, has become so closely allied to his product, that you can scarcely tell the difference; however, it is possible for you to evade that calamity if you will be honest, or at least as honest as you can afford to be. This may be another painful operation, but you will find it pays if practised long enough. Even farmers appreciate it, and they find it a blessing in receiving if not in giving, somewhat like railway corporations, who deal it out in the doubled inverse ratio.

There are degrees of honesty and truth. For instance, you may be afflicted, in times of depression, with the visits of one to fifteen drummers per day. "A." calls on you and quotes $1.00 off list. He passes on. "B." calls on you and you tell him you can buy at $2.00 off, and he, thinking "A.," whom he knows, has sold to you, wires his mills: "'A.' selling at $2.00 off; what shall I do?" Reply: "Meet competition." And you run the gamut its whole length until it recoils and hits you. In this way one large buyer went a little too far. The fifth drummer was looking at a lot of lumber just arrived, and was told the f. o. b. price was $17.50, but if he could go one better a twenty-car order would be given. He knew his mill's logs cost $9.00; cost of manufacture over $5.00; freight, $7.00. He knew also that his manager was intimate with the shipper of the alleged $17.50 lumber. Books were offered for examination to prove the honesty (?) of the retailer; the invoice price proved to be $21.50!

One millman in this case was so impressed with the breezy honesty inseparable from the mighty vastness of the magnificent prairies, with their pure and simple life, that he said to me: "Watts, it is no use. I shall be compelled to do it, though I hate to. These retailers always knew how to take all the cream—now they want the skim milk and the bucket, too. Now, I am going after some of the cream."

And he did. He opened up a line of retail yards and crushed out of existence many retailers; and to-day, over a vast proportion of the best territory, not a single independent retailer is left.

Other mill owners are preparing to do likewise on a large scale. This will be neither for the benefit of the retailers nor the consumers, because, when a few millmen and their satellites divide up a territory, the public have to pay the piper.

But you retailers still have the game in your own hands if you will use a little ordinary common sense. You need not combine nor break the law by boycotting. You just simply refuse to buy from any manufacturer who runs retail yards, and tell him plainly why you do so; whether they are under his manager's, his wife's, or his cousin's name, as some are. If you do not know which milling firms are doing that kind of business, drop a line to the writer, and he will tell you what he knows, and what he tells you, you may publish, as it is for the protection of legitimate trade and the public, from the narrow-minded selfishness of a certain class of mill owners.

The article printed above is from a pretty strong statement of the situation of the trade on the prairies, as one man sees it. Perhaps it is a little too strong. At any rate, the CANADA LUMBERMAN believes it will make interesting reading for retailers and give them something profitable to reflect upon. Possibly after doing so some of them may wish to express their own views in print, and we will be glad to hear from them.

Get After Them and Keep Going

It is the same new story every day. I wonder how many lineyard managers look forward to the auditor's "Good morning; how's collections?" and his departure with "So long; work hard on your collections," and the next morning, when you awake, find that your dream of the money coming in has all faded and the general office mail contains a two-page circular on collections, and then, when you send them a remittance of $1,000, they write you that you have only been guilty of sending in "easy money;" and the truth hurts, don't it?

All formulas and methods are good in a way, but do not fit all customers. Some of them must be handled in advance by their own terms, provided they are satisfactory to the company. I think the best method of collecting is to ascertain from each customer on the opening of his account the amount he desires, the payments he wishes to make, and the time of each. What he will do with the material, how his word is as to payments, and, in fact, all you can learn of his dealings at the time the account is opened; then use your desk calendar pad and notify him in advance of his time for payments, and see him personally when each payment is due and collect it each time.

Do not let any account run when it is past due without doing all in your power to collect it.

Do not take any person's word for any account when there is a possible chance to get the money.

A good account in many cases is open on account of a manager not being firm with the maker and insisting on settlement.

If each manager would look at each account as he would at drawing his salary, all money would be easy, as all accounts would be good.

Any account may be A No. 1 by making your first start at collecting when material leaves the yard.

Do not look upon any old account as being no good, but go after it and keep it up until you are able to run the red lines under it, and keep that account in your mind, as it will help you in making new ones and collecting them.

As a general rule all lumber is sold at a certain price, supposed to be low, and the "best price" on that certain bill, and when we do that, why should we not make our own terms and be able to use our own terms to collect. Most all lumber accounts are protected by law in a way, but the law protection is a very poor money maker, and in most cases a loss of all the profits and a part of the principal, a great deal of friendship and some time.

Try taking off the number of accounts from your ledger which should have been collected some time ago, and take a month to collect them, making so many each day that you will have to collect, and seeing more if possible, and then bet yourself a box of cigars for your wife that you get in two-thirds of the money, and see who smokes.—C. V. Chance, in the American Lumberman.

Stocks Carried by Retail Lumbermen

The transition from the retail lumber yard with a nondescript shed and a few straggling alleys, in which board and dimension were stored, to the modern business establishment of a retail lumber dealer has been remarkable, says The American Lumberman. At its inception the retail lumber yards in small towns and in some large cities were merely stopping places for lumber en route to the consuming trade. The retail dealer then handled rough and dressed lumber and stock sash and doors. The business was spasmodic. Occasionally for days scarcely a sale would be made. Such periods of idleness were followed by great activity, when material for a house or barn was ordered.

In some parts of the country retail yards may be found conforming in some degree to those described. In general, however, the retail yard has passed out of existence, having been succeeded by the merchant who handles building material, fuel and what might be termed "outdoor" necessities.

This change brought about the rise of the retail lumberman from a mere handler of bulky material to the dignity of a merchant. He is not a storekeeper in a general sense of the term, yet his investment frequently is much greater than that of those who handle general merchandise.

A list of materials constituting part of the stock carried by a well-known dealer is appended hereto. The attention of retail lumbermen is directed thereto, the attention of manufacturers also. It should be noted that while the investment in lumber doubtless is heavier than that in any other kind of stock, it probably is less than the combined investment in all other classes. It should be noted also that this merchant is handling materials that are competitive—for example, cement and lumber, prepared and corrugated roofing and shingles, plaster, board and lath, patent fencing and barbed wire, metal and wood ceiling, and probably some other kinds as well.

The list comprises a formidable array of materials. It is doubtful if any of the stock handled yields the dealer a better average profit than do the sawmill products, yet the others are in request, and naturally are supplied when called for. The mere fact that such a vast distributing business has grown out of the retail lumber yard is indicative of the business ability of those who have had the business in charge.

Following is the list of materials carried:—Lumber, cement, house paint, builders' hardware, ruberoid roofing, lawn swings, corrugated roofing, weather strips, floor finishes, metail ceilings, varnishes, wall finishes, stock fence, sewer pipe, cistern pumps, roof paint, buggy paint, floor paint, acme plaster, barn paint, screen doors, glass, wood preserver, straw board, plaster board, blinds, sash weights, ladders, dip tanks, stock food, yard fence, lime, steel brick, flue lining, fire brick, fire clay, barb wire, sash, shingles, door hangers, flooring, ceiling, glass doors, siding, brushes, muralo, enamel, etc.

Planing Mill Cost

By M. A. Baker

I have been asked to give my views on one of the worries of the planing mill business, and a very great worry it is—the overhead or shop cost. This is an item that we all have to contend with, and is an item that enters as much into the cost of a manufactured article as the material itself of which the article is made.

The experience of most planing mill men is that originally they started in a very small way, probably in some shed with a workman or two making frames by hand. There your shop cost began. It is true that it was small, but it was there nevertheless, and if figured in proportion to the work turned out, it would amount to quite a sum for each year's business. Now your business is growing, and you put in a saw, then a planer, and eventually, in order to compete with your neighbor, you are compelled to put in a fully equipped planing mill.

A great many men in the business say that a planing mill is a necessity and they must have one. If they can just make it pay even, they will be satisfied, as the additional business that is brought to the yard by reason of having the mill will make up for the loss of profit, or a small loss, that the mill may make. As a rule, this is the very man who entirely loses sight of his overhead expense, and in a great many instances is not getting actual cost for his goods.

Now why this condition? Why should not a planing mill, either large or small, operate at as much, yes, even more profit than a yard?

First, the risk of fire and accident is very much greater in the mill. You are forced to employ a very much higher grade of help, and pay for such service accordingly. If you have not had the required amount of experience yourself, you must employ a man with that knowledge, and be dependent on him. Your machinery, engine, boilers, buildings, etc., in a few years must be replaced with new ones. These and a dozen or more others are reasons enough why we should endeavor to make a fair profit from the planing mill product.

One of the main reasons for not getting a profit from the mill is the underestimating or entirely ignoring your overhead expense. If figured at all, usually it is put at about one-half of the actual amount.

If I am right in my way of looking at the matter, in order to get a proper conception of this item, you should take a fair rental value of your ground and buildings occupied for mill purposes. At least a 6 per cent. interest charge to expense should be made. The machinery investment should carry the same rate of interest. You should also add the cost of machinery repairs, tools, knives, bitts, belting, oil, greases, etc., and a certain per cent. of your machinery account should be set aside each year for replacing worn-out and out-of-date machinery. The expense of your team, or teams, to keep the mill supplied and deliver the product, the repairs on wagons, horseshoeing, harness repairing, etc., the depreciation of horses, the fuel, sandpaper, glue, nails, screws, fire, liability and boiler insurance should also be taken into consideration. In fact, it is a very hard matter to enumerate all of the large and small expenses connected with a planing mill.

Running Accounts.

Now take your pay roll and make two accounts. Make one of expense: that is, the producers or men who are a necessity to the business, but do nothing to change the raw material into a finished product. Also make one of productive labor: that is, your mechanics, bench and machine men, who are the only ones that it is practical to keep time on and who perform the labor of transforming the raw material into a finished product.

For example, we will say the work turned out by the mill equals 40 per cent. of your entire business. On this basis, beginning with yourself in the office, 40 per cent. of your salary, as well as all other salaries connected with the office, should be charged to your expense account. Then your mill superintendent, your foremen, your men who clean up, your engineer and all such men as you are using in the mill, who are non-productive, should go in your expense account. As I have said, these men are necessities to the business, but so far as producing goods is concerned, they do not add a dollar to the values. You should also take the proper proportion of your shipping clerk or yard foreman's wages and add to this account, as part of his time is put in looking after the delivery of your mill manufactured goods.

Now take your productive labor and go through it carefully, then charge it to your other account. This will be an easy matter. Add to your non-productive labor your expense account as before mentioned. Then compare this with your productive labor account, and you will find that the expense account and non-productive labor is very much the larger of the two. This may strike you offhand as absurd. Probably right now you do not believe it, but it is a fact nevertheless.

Now, if you go to the trouble to ascertain the actual figures in your own plant on the above items, you will be very much surprised at the result, and at first you will not believe your own figures, but will be looking for some mistake. I honestly can say that I, myself, was not guessing within 25 per cent. of the amount of shop cost in proportion to the productive labor, and could not believe the figures were right until they were verified by others.

Overhead Labor.

I feel the only true way is to proportion the overhead on productive labor only, as it costs practically as much in overhead to carry a yellow pine job, with a given amount of labor to produce the finished product, as it would with the same feet in some very much more expensive lumber. Therefore, if you figured the overhead on the amount of business turned out, or the labor plus the material rather than on the labor only, you would not get enough of the overhead on the cheaper grades of products, and as a rule there is much more of this class than the more expensive kind. It is no more than fair that each job should carry its proportion of overhead.

Another reason why you should figure overhead on labor only is the fact that the amount of labor varies greatly in our class of work. I mean by this that the job that goes through the mill may have only a few feet of lumber and require several days of labor to build up the required piece, where, on the other hand, the circumstances may be exactly the opposite. For instance, you are making a sideboard. This is a case where the labor is far in excess of the lumber costs. Being special, it requires your best workmen all the way through; it requires more attention from your foreman; you are obliged to be more careful in handling, and if you compute your overhead on labor and material costs, you do not come out even. This, I think, is true of a large per cent. of detail work.

In some localities that I am somewhat familiar with, the millmen and lumber dealers appear to have the idea that a window frame is a common article, and should have a common price, without regard to size or specifications. In fact, I have seen cases where circle-face frames were figured at the same average price as the plain frame, with no change in price for the difference in sizes. This I think is very poor business. This is probably a case of mistaken economy for the estimator. If it is done for this reason, why not go a little farther, and put a flat price on the rest of your goods? Say, a 2x10, without regard to length, would have a certain price each, and so on through your list. This part would not strike the same estimator favorably, for he knows what each length of 2x10s will cost him. But he has not taken the time to figure out the cost of the frame in proportion to its size, losing sight of both overhead and material, and as a consequence is guessing at the price. A frame changes in prices with every inch added or taken away from it.

Abuses in Mill Business.

The item of frames is just an illustration of one of the great abuses that have crept into the mill business. There are hundreds of others of more or less importance, and in time I hope to see this remedied by the estimator becoming educated up to the point where he recognizes the fact that on every article that is worked through the mill there must be an overhead charge added, and also that every size of frame, sash, table, door, etc., has its price of manufacture just as surely as does a certain size of glass or screw in other lines of work.

Several years ago I began work on a mill estimator along the lines I have spoken of, and have been perfecting it ever since, with the help of several other gentlemen in the mill business. While it is not entirely complete, it covers about 90 per cent. of the mill work. This book I guarded very closely, and kept from our competitors until I came to the conclusion that it was as much of an advantage to us for our competitors to know these things as it was to know them ourselves, and I would be glad to show them to any planing mill man interested.

THE WOODWORKER

Time and Money Saver

It has been said, "When you get a good thing, pass it along," so I am giving in this article drawings, etc., of what I know to be a profitable and serviceable attachment for ripping short stock on a self-feed rip saw, writes M. E. Hale in The Wood-Worker. Every manufacturer must use all the scrap possible to show good dividends on his investment, and with the device shown, stock as short as 5 inches long, ½ inch and wider, can be used—an exceptionally good attachment on a saw for chair manufacturers.

Figs. 3 and 4 show a saw on which all the feed rolls swing on a shaft (C), which had a plain set-collar on the end next to saw, to keep feed roll frames in place. Removing this, I put on the little attachment shown in Fig. 1. The opening (a) is slipped over the end of shaft (C) and acts as a collar, while a ¾-inch hole extends through casting (b) and a ¾-inch stud (c) fits into this, to support one or more saw-toothed dogs— (d), Fig. 4—that serve to keep stock from kicking back. To keep the dogs from dropping on the table when stock feeds out from under them, a 5/16-inch pin (e) is pressed into casting (b), shown in Figs. 1 and 4, for the shoulder of dog to rest against.

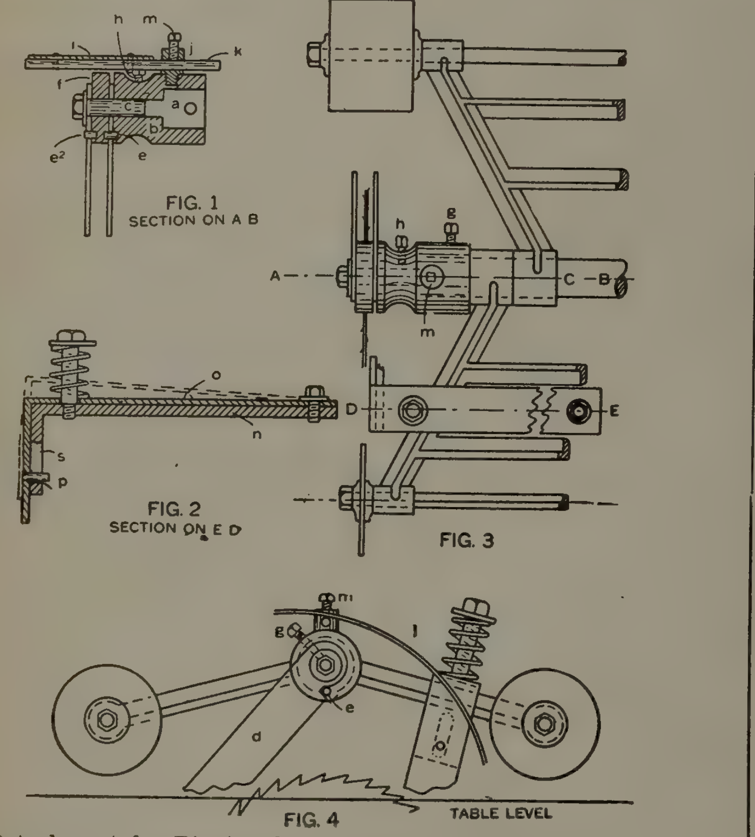


FIG. 1
SECTION ON A B

FIG. 2
SECTION ON E D

FIG. 3

FIG. 4

Detachment for Ripping Short Stock on Self-feed Rip Saw

Now, for using two dogs, turn a collar (f) ½ inch thick, to fit stud (c), and drill a hole in it to fit over pin (e); on the other side of collar (f) press another 5/16-inch pin (Ee) for second dog to rest against. Now notice when the saw table is raised, it will come up against the dogs, and for adjustment of this setscrew (g), Figs. 3 and 4, may be loosened, and casting (b), turned to the right, will cause pin (e) to raise the dogs—and vice versa for lowering. For using only one dog, loosen setscrew (h), Figs. 1 and 3, and remove stud (c); slip off collar (f) and one dog, then replace stud.

Another feature is that of a fender, to keep sawdust, etc., from flying in the operator's face, and is to put on by screwing a lug (j) into casting (b), Fig. 1, 1 inch diameter and 1 inch high, with ⅝-inch hole through it, for shaft (k). Onto this is riveted a 6x14-inch circle fender (l), Figs. 1 and 4, better seen at (l), Fig 4. To adjust it, loosen setscrew (m), and the shaft (k) is free to revolve, letting fender up or down.

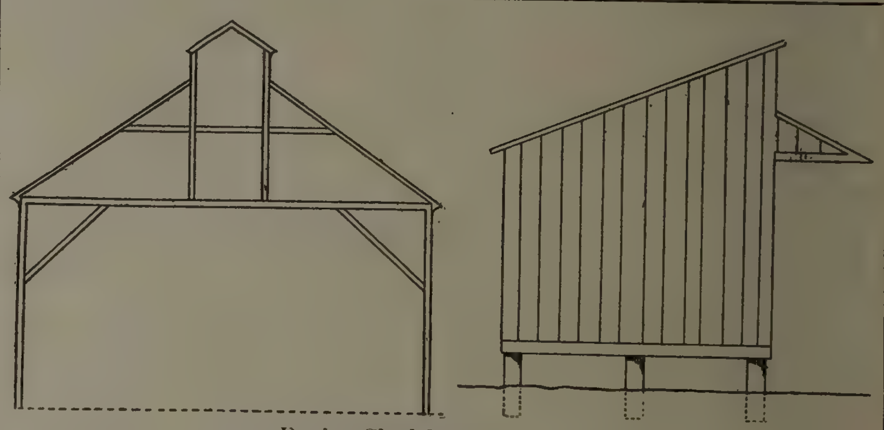
After putting this device on, I found that, for real short stock, the front feed roll would pick it up, so I added a spring dog that would hold stock firmly to the table, as will be seen in Fig. 2, and which hardly needs any explanation. First, angle (n) is bent from ½x2-inch iron, with ½x2-inch slot (s) cut in lower end, and two ½-inch holes tapped in top angle, one near each end. Then a second angle (o) is made of ¼x2-inch iron, and made long enough to come down level with front feed roll—see Fig. 4. A pin (p), Fig. 2, is pressed and riveted into this, to fit into slot of bar (n). Now put in a ½-inch capscrew at the end of bar (n), leaving hole in (o) large enough to work freely. Then put another ⅝x3-inch stud, with a shoulder and ½-inch thread, on the end next to bend, through a small coil spring, and screw into bar (n). Now bolt bar (n), Fig. 2, firmly to feed roll frame, as shown, and this will leave dog (o) to work under tension, as seen by dotted lines, to hold stock down firmly to table—Fig. 4.

Suggestions Upon Drying Sheds

Drying slack staves is one of the principal features of the slack stave business. Improper drying of staves means no end of trouble, says "Barrel and Box." Claims must be paid on this account because of a long train of defects which prevail from improper methods of drying. Mouldy staves are caused a great deal from the weather conditions, of course, but mould can be prevented to a great extent by care in the drying; and this, of course, means that care should be taken in selecting the location of the drying sheds as well as their proper construction.

There have been and are yet instances where staves are piled out on the yard without a shed. When the proper height is reached an improvised roof is made of cull staves to shed the water. This is false economy, for good drying results cannot be had unless sheds are properly built for the protection of the stock.

Most of the sheds are built entirely open from the roof down to the ground. However, many manufacturers to-day roughly board up the side of the shed that is exposed to the rain and snow. At some of the plants the sheds are built up from the ground from three to four feet with a floor to keep the stock free from the dampness of the ground. Sheds are also built in pairs, the two being close together so that their adjacent sides are protected on account of their position with reference to each other, and the same time far enough apart so that the air is allowed to circulate freely.



Drying Shed for Slack Staves

All of these things indicate that the trade is studying the drying methods and is making improvements upon old methods used.

The illustration in Fig. 1 shows a good construction for an ordinary drying shed, the height from the ground to the roof being 16 feet and the width of the shed 25 feet. The roof is so built that, as shown in the illustration, there is good ventilation at the top, and when properly braced it makes a substantial shed for all practical purposes and under ordinary circumstances.

Fig. 2 shows the end view of a warehouse used for storing dried staves, heading and hoops awaiting shipment. The extension on the front of this shed is made so that wagons can be hauled up to it and the stock protected from the weather while it is unloaded. It is intended that this warehouse be placed with its back directly along side of the switch, so that the stock can be unloaded from the shed into the car. The back of this shed is boarded up and nailed lightly, so that two or three boards can be easily taken off from any part of the shed and the stock taken out without any trouble.

This is a more convenient method of loading the stock from the warehouse into the car than if doors are provided, as it is often unhandy to get at just the stock that is wanted for the particular order in hand.

These two designs of sheds are in use by manufacturers and are some of the best types used to-day in any part of the country.

Some Peculiarities of Heading

An ordinary barrel head is a very simple-looking piece of wood, with no intricate lines and no very complicated machines or methods used in its manufacture, says a writer in the St. Louis Lumberman, yet there are quite a number of peculiar features about the barrel head if one studies it closely and from all sides. It is very seldom that one sees a solid head, that is, a head that is made from one piece. They are generally made of two, three and four pieces. Usually the fewer pieces the better it suits the cooper, and the better it suits the man that does the turning or finishing of it, because he can do more of it in a day. At a recent meeting the subject of beer stock heading was under discussion, and one manufacturer who turns heading, in speaking of a certain size beer keg head, said that he could turn 500 more a day from two pieces than he could from three, because it takes time and costs money to do the work of jointing and fitting the pieces together. The more joints the more time it takes, and the more work it requires in the process of jointing, the more boring of holes, and the more doweling.

It is easy to understand how it costs more to joint three or four pieces together than it does to joint two pieces, and on this point it would be less expensive yet, from the working side, to make heading out of one piece. There would be additional expense in an undertaking of this kind, however, from the fact that the wide stock necessary to this work would cost so much as to make it impracticable. Heading properly made is made of quartered stock, and to get quartered stock wide enough for a barrel head means to use only big giant trees, which is almost impossible in the everyday heading plant.

What the man that turns the heading and generally the cooper, too, wants is the fewest number of pieces practical in heading, not merely on the point of less trouble in working, but the average cooper will probably say when asked that the fewer number of pieces in heading the better the head, no matter whether beer barrel head or slack barrel head. Probably he would be in a large measure right, too, yet there is a chance for argument on this very point. Take oak flooring, for example, and the general practice is to make it into very small units as to width and make more joints, so that they will stay tight. Following this idea a little further, we can find that in building saw tables, shaper tables and various tables of this class in which it is desired to have strength and to retain a true, plane surface, it is quite a common practice to rip the stock into narrow strips and glue them together to get this, instead of using large units. It might be argued from this and other incidents of the same character that could be brought to light that the more pieces in barrel heading, within reasonable limits, the better, especially where it is desired to have the head retain its shape and keep tight. This, however, while it seems to be logical, will hardly hold the favor of heading turners, because it involves extra work. Still it is well to keep it in mind, because as timber gets scarcer the necessity becomes imperative frequently for using more pieces in heading than formerly, and it would be some relief to feel that the main handicap to using narrow widths in heading comes from the additional cost of jointing and putting together.

It would be an interesting and valuable experiment for some manufacturers of beer heading to take three or four heads of the same size, one made of a solid piece, if it is practical to find it, one made of two pieces, one of three, and one of four or more, dry all the stock thoroughly, joint it closely, and then lay all the heads away and carefully note the effect time has on the heads. It would probably be found that the head made of solid wood would do more shrinking, have more tendency to warp, and would be more difficult to keep in shape generally than the one made of the greatest number of pieces. This is partly because the larger the unit the more difficult it is to thoroughly season it in the centre, whereas the smaller the unit the more easily is the wood thoroughly seasoned and afterwards has less tendency to swell and shrink. Again, in matching and jointing together all the different pieces of wood, there is some variation in the texture, and in the tendency to shrink and warping inclinations, and these variations frequently counteract each other so that the heading made up of a number of pieces may really hold its shape better than when it is made of only one or even two pieces. There are more joints, it is true, and more chances for open cracks to develop, yet the more joints there are, the smaller is the chance for each individual joint to open up perceptibly, because the pieces are made up of smaller units and consequently have smaller range for shrinkage.

Among the peculiarities of heading developed in connection with jointing and matching together, it is found, for example, that if heading is jointed and rounded while it is green, when it dries out, the joints are tight in the middle and open at the ends, and an expert heading man can almost immediately on examining a lot of heading tell whether it has been jointed before it was thoroughly dry or not. He can't always tell, because the man that does the jointing may be aware of this peculiarity of heading, and even if he jointed the head while green he may have made his joints open enough in the centre so that when they dried and shrank at the ends they come pretty near fitting. The explanation of it all is that the ends dry out quicker and more thoroughly than the centre, and as they shrink from both sides, the joints which were once straight become slightly full from the process of drying and consequently a little tight in the centre and open at the ends.

Of course it is understood that heading swells and shrinks only in width, that is, so far as affecting the joints is concerned, and if the heading is turned before it is thoroughly dry, on shrinking it becomes narrower across its width than lengthwise. It also has more compressibility, crosswise, or sidewise, than endwise, and if put under pressure, which is sometimes essential in tightening the barrel, it may be shrunk a little in width, but not perceptibly in length. If it were practical, it would be quite an idea and contribute to a truer circle finally to turn heading so that, instead of being a true circle, it would be a little larger in diameter across the grain than lengthwise, and it is a wonder that some genius has not gotten hold of this point before now and devised a machine that would turn heading a little full on the sides.

The Electrical Driving of Wood-working Machinery

In saw mills and wood converting works usually the motor has to be fixed in a position where it is exposed to sawdust, shavings, etc., and in order to obtain satisfactory running it becomes necessary to prevent this matter from getting into the interior, where it would choke up the windings or brush-gear.

From the above point it would appear that the most suitable type of motor to use would be totally enclosed. As, however, this necessitates a large and therefore an expensive motor, it is usual to employ a small motor and to cover the apertures with brass or copper gauze of a fine mesh with a view to allowing a circulation of air for cooling whilst checking the dust. This method is not very satisfactory, as the sawdust blocks up the mesh, preventing the air from circulating, and thus nullifying the purpose for which it was fitted.

In order to get over the above difficulty the pipe-ventilated motor has been designed. This type has all the advantages of the totally enclosed, whilst being cheaper and also more efficient.

The following advantages are claimed for this type: Frictional losses are materially reduced; no oil is necessary, the bearings being filled with grease, which serves for long periods without refilling; the machine, without adjustment of bearings, will work in any position provided the shaft is horizontal.

It need hardly be said that in motor and dynamo management all bearings should be constantly and efficiently lubricated. A little finely powdered graphite added to the oil can be recommended, as it retains the lubricant between the rubbing surfaces and gives them a fine face.

The commutator should always be kept very clean. Emery cloth should not be used for this purpose, but fine glass or sand paper held on with a wooden block is to be preferred. Afterwards burnish and rub over with a rag damped with paraffin.

The brushes should be kept well trimmed and even in pressure. A good plan for the bedding of brushes is to place emery cloth round the commutator outwards) and turn same by means of the motor or dynamo pulley. The brushes by this means are ground to a true surface. Never remove the brushes from a shunt wound dynamo while the current is on, but the brushes should be out of contact while machine is standing.

Great care must be taken to prevent sparking, which, of course, causes undue wear and tear, and also may be the cause of fire. The chief causes of sparking are overloading, bad contact between brushes and commutator, incorrect adjustment of brushes, commutator bars rough or loose, etc.

Armatures and filed windings must be kept clean and dry and be well insulated. At intervals, when stopping the machine, all dust, etc. caught up by the armature should be blown away.

Overheating is generally due to an overload, leakage to earth, or various forms of short circuiting. These should, of course, be carefully guarded against.

Always start a motor slowly. A usual rule is to bring over the motor starter one notch or stud per second, as a sudden putting on of the load may cause the fuses to blow.

Care must be taken that all electrical machines are kept thoroughly dry, and when not in use should, if possible, be run for a few minutes every day.

The squirrel-cage induction motor is essentially a constant-speed machine, so that in cases where several speeds are required the motor is connected to the machine, through small countershaft, from different sized pulleys for obtaining the necessary range of speed. The motors are very simple, and, in the case of the larger sizes, are started by means of ''auto-starters.'' The handle of the auto-starter'' has three positions—''off,'' ''starting'' and ''running.'' It is first moved to the starting position, and then when the motor has attained a fair speed, to the running position.

In fixing electric motors, the usual plan is to solder or clamp a bit of copper wire from the leads piping to the bed-plate of the motor, and from the latter to the nearest inlet water pipe.

Should the motor drive with a belt, be careful to avoid short centres, as this means slipping belts and hot bearings, with their attendant loss of power. The belt should be of ample width and be kept pliable; also never drive from large to very small pulleys.

In installing lamps in suitable positions over or near the various machines, it will be found good practice to fit them with suitable reflectors, so as to deflect the rays to the required points, viz., on to the working parts of the machine itself, instead of allowing them to be scattered over the mill.

The ordinary incandescent lamps take from 3½ to 4 watts per candle-power, but have largely given place to metallic filament lamps of various types. The latter, according to the make, absorb from about 1.2 to 1.7 watts per candle-power, thus effecting a great saving in light and output. In factories, etc., .05 to .1 candle-power per square foot may be taken as a general rule, and every machine should have at least one lamp, or more if necessary, according to size of machine and nature of work. Installations are generally put in by the contractors, under specifications and directions of the lighting company in the district, and are passed by them after fulfilling leakage to earth test, etc.). The leads are then connected up to the company's mains.

Some companies do not compel wood casing or metallic conduit to be continuous in lighting circuits or over-motor leads, etc.

We append a few of the Board of Trade rules, which may be of service to those who contemplate electric installation:—

1. Pressure of Supply to Consumers.—The pressure of a supply to any consumer shall not exceed the limit of low pressure, except for special purposes, for which a medium pressure supply may be given on the consumer undertaking to comply with the following conditions:

Where the supply is for power purposes,

(1) The frame of every electric motor shall be efficiently connected with earth.

(2) The consumer's wires forming the connections to motors, or otherwise in connection with the supply, shall be as far as practicable completely enclosed in strong metal casing efficiently connected with earth, or they shall be fixed in such a manner that there shall be no danger of any shock.

(3) The supply to every motor shall be controlled by means of an efficient cut-off switch, placed in such a position as to be easily handled by the person in charge of the motor, and connected so that by its means all pressure can be cut off from the motor itself, and from any regulating switch resistance or other device in connection therewith.

(4) Switches, efficient fuses, or other automatic circuit breakers shall be provided, so as to protect the circuits from excess of current, and all switches and cut-outs shall be so enclosed and protected that there shall be no danger of any shock being obtained in the ordinary handling thereof, or of any fire being caused by their normal or abnormal action.

(5) A notice shall be fixed in a conspicuous position at every motor and switchboard in connection with the supply forbidding unauthorized persons to touch the motors or apparatus.

2. Introduction of Three-Wire System into Consumers' Premises.—When the pressure between the outer conductors of a three-wire system exceeds 250 volts, and the three wires of the system or two pairs of wires are brought into a consumer's premises ,the supply shall be given to two pairs of terminals arranged in such a manner that there shall be no danger of any shock, and the wiring from these terminals shall be kept distinct.

3. Extra High-Pressure Supply to Consumers' Premises.—An extra high-pressure supply shall not be given to any consumer's premises other than a factory, a mine, or electric traction works; and no such and subject to such regulations as the Board may prescribe.

New Era in Mill Constuction

We have reached what might be termed a new era in mill and factory construction, a time when greater thought is given, not merely to fire-proofing and permanency in building, but to extra cost and solidity for the sake of economy in the wear and tear of machinery afterward, says The Wood-Worker. Going way back to the early days, when mills were rare, we find there was a certain period of more stable construction, especially of foundations. We find carefully and expensively-built stone foundations for engines and heavy machines. At that time engines and other machines were very cumbersome, it is true, but for all that, we had a greater respect for properly bedding them than we did afterwards. With the coming into more general use of wood-working machinery and the eliminating of unnecessary weight in boilers, engines and machines, there seemed to be a loss of due regard for foundations and a proper respect for permanency. People took to sticking boilers down on the ground almost anywhere, and bedding engines on a couple of timbers, then hanging the shafting and journal boxes to almost every manner of post and bridgetree that happened to strike the fancy of the builder, or be most convenient. The result was that not infrequently the damage to machinery in the course of a year or two run, the settling and twisting out of line, was often more in dollars and cents than the original cost of putting in foundations and setting it up.

It has taken us a long time to get over all this, and lots of machinery has been ruthlessly spoiled and its life cut short, but we are now coming back to the idea of greater permanency and are taking it up in even a better and more practical form than in the earlier days. We are realizing that it pays to spend twice the money in putting up a mill foundation and frame and securing stability, than to do it cheaply and pay the penalty in damaged machinery and repairs at the end of every year. Meantime, concrete has come to help out, concrete and steel, and with these we are able to build mills and factories in such manner that shafting will stay in line, machines will set steadily and level, and there is not the excessive friction and waste of power in unnecessary strains, nor does the machinery wear out so rapidly as in the more careless days. Not only are engines being put on concrete foundations, but many of the machines are firmly bedded the same way, and then with steel, and even heavy timber posts, carefully dried first and then set on concrete foundations. We have more stability for hanging line and countershafting above the ground, have it so that we can put up machinery permanently and feel that it will stay there, whereas in some of the days gone by we put up machinery with means for adjustment attached, and feeling right along that it had to be adjusted from month to month to keep it in proper shape. In fact, there has been enough money spent in adjusting machinery and going over it from time to time to keep it running, to have built good mill and factory foundations all over the country, to say nothing of the damage done the machinery.

We, therefore, hail with enthusiasm the new era in building, and turn from the old haphazard and inefficient methods of construction, just as we have been turning from what is termed the reckless wood-butchering of the early wood-workers. One is just as wasteful as the other. The present is no time for building firetraps or making rickety structures of any kind in which to install machinery. It doesn't matter whether it is a saw mill in the woods or factory in town, it is cheaper in the end and much more satisfactory all the time, to do the work properly. There will still be need for portable plants, but a portable should be strictly portable, and handled accordingly, and a plant built on a plan of permanency should be built right at the start.

Scientific Cruising

Recent investigation carried on by the United States Government has shown the need of more improved methods of cruising timber in order to procure accuracy in determining the amounts on different tracts owned by private individuals, says the Lumber World. A glaring example of the evils of sight cruising was recently developed in the examination of the books of a large concern operating in the yellow pine region of the South. The cruise showed from four to eight thousand feet an acre, but in every instance the records of the company revealed the fact that from three to five thousand feet more than the original estimate showed, had been cut. The buyer of the timber had lost nothing by this low estimate, but at the same time the earning power and the life of the operation was improperly calculated, though fortunately without financial damage to the concern in question.

Scientific and necessarily more thorough methods are coming into use to-day in the estimating of timber. It is a science that can be attained only through long practical experience and training. Each cruiser of the old school had his own idea of the methods best suited to secure a rough approximation of the timber on the ground covered by him. But this depending upon the eye to judge distances, and at the same time observe average height and diameter of the individual trees, was largely a matter of guess work. Then, too, each cruiser had his own idea of what should be the proper allowance for defects. Taken altogether, the system was a poor one, and the only reason that severe financial loss was not occasioned was due to the custom of under-estimating so that the buyer might receive the benefit of any mistake.

Undoubtedly the most accurate method of cruising is that employed by the United States Government to-day, though it is decidedly more expensive than a cruise made by the older methods. This method is known as the "Strip Survey," and necesitates the use of a crew of three men. One of the crew, a tallyman, records the species and their diameters, the latter measurements being taken of individual trees by calipering. A surveyor's chain is used to measure the length by stretching it along the ground. The trees within an estimated distance of one-half chain, or thirty-three feet, on either side of the chain, are then calipered and the figures called off to the tallyman. Upon the completion of ten chains, detailed and accurate measurements are had for one acre. Sometimes a fourth man is added to the crew, one man devoting his attention to laying the course with the compass and thereby expediting the work of the others. Such cruises, particularly when topographical notes are taken, insure the basis for an admirable working plan for future lumber operations, and obviate the necessity of later surveying the tract for the building of a logging road.

CAMP DEPARTMENT

Business Methods in Lumbering

The lumbermen as a factor in the conservation of the forest resources of the country, is a feature of the lumbering situation that is all too frequently overlooked. A concise review of the importance of careful operating methods in the manufacture of lumber was given by Prof. Thomas, of Wabash College, in an address before the Indiana Hardwood Lumbermen's Association at their recent annual meeting. Prof. Thomas asked what the lumbermen could do to hasten the era of conservative lumbering, and his own reply to the question was as follows:

1. By introducing better machinery and methods for decreasing the waste and increasing the output from your mills. The modern saw mills of America are to-day the best in the world and the man who wastes by the use of antiquated machinery or obsolete methods is a public spendthrift. What is meant by this your own observation and the literature of your profession will make clear. One-third of the log is lost in the ordinary process of sawing, and by reasonable care this can be reduced by one-half. No doubt that would more nearly correspond to the purposes for which the lumber is intended.

2. By specializing in cutting and marketing the different kinds of timber. No man is competent to get the most out of any considerable variety of timber and what such efforts waste for the employer could if discontinued be made to add materially to the increase in profits from the business. With the introduction of up-to-date methods the lumbermen will turn the logs over to experts to saw and sawing will become a profession, the subdivisions of which will correspond more nearly to those in other professions.

3. By construction of mill waste utilization plants in convenient centres and rescuing from waste much valuable material. About $3,000,000 worth of hardwood is used each year for this purpose and the value of the products is over $5,500,000. Michigan derives a revenue of nearly $2,000,000 annually from its hardwood distillation business and makes use of 25,000 cords of mill waste and stumps. It has been estimated that in the United States in 1907 the waste in yellow pine lumber would have yielded if steam treated all the gum turpentine used that year; if spruce, hemlock, poplar and cottonwood all the pulp used in paper; if chestnut twice as much tanning extract as was produced from this wood that year. The waste in beech, birch and maple was nearly as much as the total amount used in the wood distillation business and the waste in oak lumber twice the amount of all the hardwod used for distillation.

Utilize Tree Tops for Firewood.

4. By looking after the utilization of the tops of trees and in some economical way converting them into wood instead of allowing them to decay and waste. Last year Indiana used nearly $11,000,000 of wood for fuel with average value of $4.03 a cord. That too much high priced timber is used in this way is evinced by the fact that the cost of firewood in Indiana is higher than in most states where similar forest conditions prevail. In Kentucky ($2.11), Ohio ($3.47), Illinois ($3.69), Iowa ($4.01), Missouri ($2.67), Tennessee ($1.77), Pennsylvania ($2.37), Maryland ($3.34).

A careful utilization of the tops, inferior portions of poor trees and those worthless for lumber or that could not be cut and marketed with profit would save for valuable lumber many perfect trees now cut for wood. In private logging operations in the United States one and one-half times more merchantable timber is wasted than in the logging operations conducted in the forest reserves.

5. You should be the first to protect and encourage the care of the second growth timber in your region. Perhaps you will not be the one to cut all of this, but remember that the future supply of lumber affects the present value of your plant, and this is the investment upon which you or your heirs must some day realize. The young second growth trees which are as a rule destroyed in logging operations would cost more than the $10 per acre to replace and as the chances of immediate replacement are uncertain and the loss to the wealth of the state is much above this. Also remember that second growth grows faster than the original tree and in a very few years it will have a substantial market value.

6. By securing information from the Forest Service (Bulletin No. 73) about the quality of the product that can be cut from trees of a given diameter and cease cutting trees too small or too poor to yield only enough good lumber to pay for the loss of handling the poorer grades. This information referred to, if applied, will leave many trees uncut to yield valuable logs later or to be used for other purposes at a good profit, and the time given to handling a volume of unprofitable business can be put on introducing better methods in a smaller volume. Many acres are completely denuded yearly at a loss to the mill men, who make good this loss only by handling a larger quantity of first grade timber. At least stop destroying that part of our forest that actually loses you money. This saving may apply not only to the size of the tree cut but also to the manner of arranging log lengths to eliminate defects in the finished product and discarding or cutting out crooked or hollow sections, the handling of which would be a distinct loss.

How to Save Money.

7. By reducing the mill force to a point that will be sufficient to keep pace with the sawyer, but allowing him time to study with care each log, rolling it over on the carriage until he is certain of securing from it the very largest quantity of the best grade of lumber. A sawyer who is judged solely by his speed or the number of board feet he is able to put through in a day is often a most expensive man and a real loss to his employer. The same can be said of the edger and trimmer.

8. By considering the possibility of extending your operations and securing low priced lands in the vicinity of your mills, and, through the assistance of the state or federal department of forestry, inaugurating a system of conservative lumbering, forest planting and cultivation until sufficient acreage has been secured to insure permanency to your business, enabling you to protect your investment from possible depreciation through lack of raw material. It has been demonstrated repeatedly that raising trees on low priced lands is a profitable business and with the added incentive of an investment that depends on the availability of such a supply, the profit will be correspondingly large to the investor.

9. By giving attention to the care of brush, piling and burning them at the proper time when the adjacent trees will not be jeopardized. Our state loses annually probably between $50,000 and $75,000 worth of lumber from forest fires and an unestimated amount from the destruction of the forest litter, soil and young trees. The presence of worthless tops and brush is one of the principal menaces to adjacent timber, not only from fire but also from destructive insects and fungi.

10. By advancing the value of your products to take cognizance of the present cost of growing timber and in some way curtailing our extravagant per capita consumption. The higher cost of first grades would encourage the use of cheaper kinds and so help to conserve our supply. We could easily adjust ourselves to the use of one-fourth the present amount without inconvenience, and now is the time to economize while we have still a little bank account rather than to wait until even our credit is exhausted.

11. You will greatly aid the cause by being leaders in your respective communities in foestry matters and taking a personal interest in legislative affairs that have to do with taxation, fire, state reserves, education, arbor day and the like.

Education in Lumber Camps

Alfred Fitzpatrick, superintendent of camp education, is on a tour of organization and preparation, embracing the lumber and construction camps of Western Ontario and the Western Provinces, and is making ready for the summer education work among the laborers in these places.

The Reading Camp Association, with which Mr. Fitzpatrick is affiliated, is nine years old. Not only the lumber camps in the region north of Lake Superior, but the construction centres of the three great Western railroads, are included in the field which the association covers; and the list of officers includes such prominent figures in the world of transportation as William Whyte, of the C.P.R., who is the honorary president; D. B. Hanna, third vice-president of the Canadian Northern, and James Playfair, president of the Midland Navigation Company.

"To be personally popular with the shanty men one must handle the axe, saw and cant-hook with any of the old-time beavers, fallers, junkers, loaders and skidders. The river driver's standard of character is ability to handle the peavey, ride a log and break a jam. Hence, the student who would win the frontier toiler and help develop his mind and soul, must first be his hero; that is, he must excel in the special work of that laborer. Were adult education compulsory, this heroic method of winning men might not be necessary; but when the education of children is not compulsory in some parts of Canada, we can scarcely hope for the ideal condition in the very near future.

"The Reading Camp Association has always maintained that, as the present systems of education are inadequate, leaving the average boy, as they do, in the third reader, the state should remodel these systems and fit them to the needs of boys in frontier settlements in the woods, mines, railway and other camps. It is just as practicable to supply books, magazines and newspapers to men in the farthest confines of civilization, as it is to supply pork, beans and butter, and surely instructors fresh from the college campus or farm are as portable as the average cook, cookee and bull cook.

Men Eager to Learn.

"The reports of our night schools in the lumber camps from year to year are abundant testimony that when given the opportunity and encouraged, 90 per cent. of the men who can read, take advantage of the reading material afforded, and 50 per cent. of all the men in the camp will attend study classes more or less regularly, making the average regular attendance about 90 per cent.

"The clergyman who casually visits the camp is regarded as living in a sort of paradise beyond the reach of men who have to turn out of their hard bunks at the sound of the gong long before sunrise, who eat only one meal by the light of day, and for whom society provides nothing better than the saloon. His ideal, they think, is scarcely realizable for them in their present condition, and he would catch them better if he would spend his time trying to get the state to better their actual environment on earth.

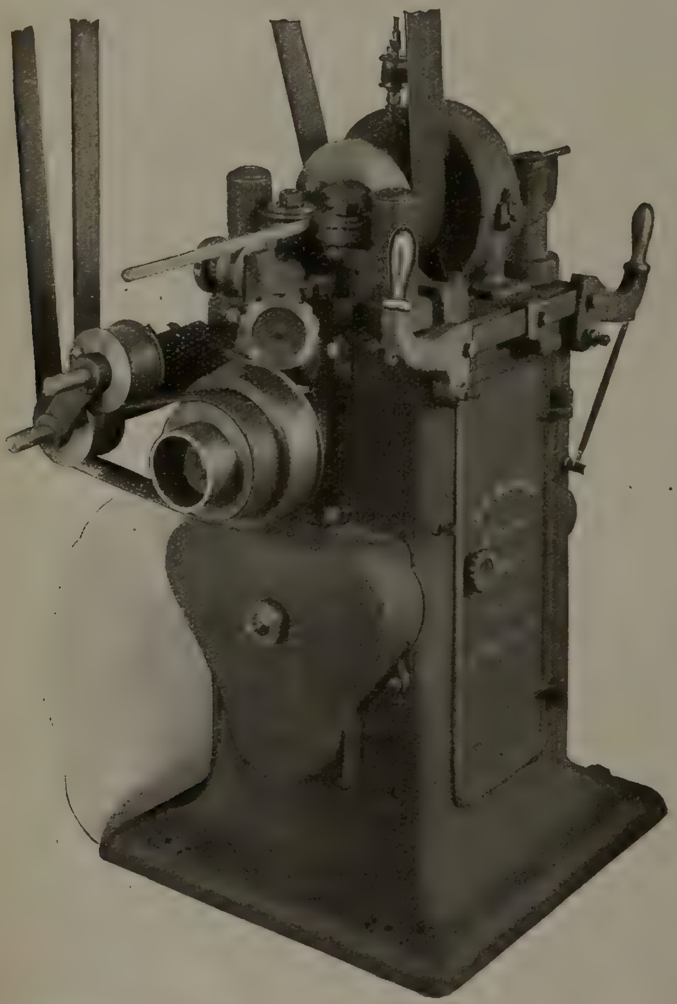
Mr. Fitzpatrick, in proof of the success of the association's work, presented the reports of instructors in the various camps where the work was being carried on. C. V. Combe, instructor at the Winnipeg hydro-electric plant at Point du Bois, remarked that his was a large camp of from two to four hundred men, representing nearly all the European immigrant peoples. He had found that pictorial instruction was the best method of teaching the English language to foreigners.

E. H. Clarke's report from the Canadian Northern construction camps of the West was summed up in an enthusiastic paragraph at its conclusion. Mr. Clarke said: "'The results of the past few years in our railroad camp show a great change in the camp life. Our camps are not little heavens yet, but old-timers will tell you that the life is changing, and changing for the better; and they are not slow in praising the Reading Camp Association for the change.'"

Machinery and Equipment

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

The accompanying illustration shows the well-known "Money Maker Adjustable Rod and Dowel Machine." These machines have but one adjustable cutter head with which any desired variation in sizes between $\frac{1}{4}$ in. and 2 in. may be quickly obtained. They are being widely adopted by saw mills to convert edgings into high grade chair stock, curtain poles, dowels, etc. For chair and furniture factory use where the requirements for nice fits and smooth finish are very exacting, these improved machines are of great assistance. The facility with which they convert short cuttings and long edgings into high grade, marketable product commends them to every systematic, watchful manufacturer.



W. S. Hawker Coy's "Money Maker Adjustable Rod and Dowel Machine

By reason of the many radically new features embodied in this new tool and the resulting capacity which exceeds the expectations of users of this class of machinery, the builders have adopted a demonstration plan of business which satisfies prospective purchasers of the profit-making capacity of their machines, before they are accepted.

Another view of this tool with a few of its many advantageous points will be found in the advertising pages. The builders, W. S. Hawker Manufacturing Company, of Dayton, O., will be pleased to give detailed information on request.

Big Steel Mill Finished

A complete new steel mill for Simonds Saws has recently been built and is now in operation at Lockport, N.Y. The steel making part of the Simonds Manufacturing Company's Chicago factory was too small to meet the constant growing demands for Simonds Saw Steel. More steel had to be provided, and consequently, plans were prepared for a new mill. Construction began at Lockport, N.Y., early last summer, and the first steel was rolled on Monday, January 2, 1911.

At Lockport there is a separate rolling mill for band saw plates, cross-cut saw plates and circular saw plates. Ample room is also provided for plates for Simonds hand saws and steel specialties. One general building is located adjacent to the end of the rolling mills for the making of steel ignots.

A considerable portion of the iron used is the famous Dannemora iron, imported direct from Sweden, on which there is a high duty. Nothing that bears the name of "Simonds' has ever been made from anything but the very best of materials and in a crucible furnace.

Uniformity—is still Simonds constant watchword. To make sure of this desired uniformity, careful chemical analysis is made on every heat turned out of the mill. The physical properties of the steel are also tested out.

A modern gas producing plant is in operation next to the crucible furnace building to produce the great amount of gas used in the furnaces.

The machinery of the Lockport mill is thoroughly modern. All that is latest and most up-to-date in scientific crucible steel making is made use of. New machinery and new methods have enabled them at once to double their former steel production.

Direct from Niagara Falls to the Simonds Steel Mills, high voltage wires carry current sufficient for four thousand horse-power, and an electric plant of no mean size is required to house the transformers and necessary switchboards.

At the entrance to the grounds at Lockport, a substantial two-storey brick building has been built to accommodate the office force and the laboratory. The laboratory has always been one of the chief points of interest around Simonds Steel Mills, as experts make careful tests of every lot of steel produced for saws that bear the name Simonds.

For passenger traffic an electric line has half-hour fast service direct to Buffalo. All trains stop at the Simonds station. The New York Central Railroad has freight connections with the Simonds private switch track, which has four spurs, running right into the buildings of the steel mills, so that raw material may be unloaded and finished plates shipped with the least possible delay.

The John McDougall Caledonian Iron Works Co., Ltd., Montreal, have issued an interesting bulletin (106) relating to the "Volute Pump." Volute pumps are well adapted for handling "stuff" and other heavy liquids in pulp and paper mills.

TENDERS FOR PULPWOOD LIMITS.

Tenders will be received by the undersigned up to and including the 10th day of April next, for the right to cut pulpwood on certain areas situate:

(1) On the Abitibi Lakes and River tributary to the Grand Trunk Pacific Railway, and Northern Ontario Railway, in the District of Nipissing.

(2) On Rainy Lake and around the shores of Lower Manitou Lake, tributary to Fort Frances on Rainy River, in the Districts of Rainy River and Kenora.

Tenderers shall state the amount they are prepared to pay as a bonus in addition to dues of 40 cents a cord for spruce, and 20 cents a cord for other pulpwoods, or such other rates as may from time to time be fixed by the Lieutenant-Governor-in-Council, for the right to operate a pulp and paper industry on or near the areas referred to. Such tenderers wil be required to erect mills on or near the territories and to manufacture the wood into pulp and paper in the Province of Ontario.

Parties making tenders will be required to deposit with their tender a marked cheque, payable to the Treasurer of the Province of Ontario, for ten per cent. of the amount of their tender, to be forfeited in the event of their not entering into agreement to carry out conditions, etc.

The highest or any tender not neressarily aucepted.

For particulars as to description of territory, capital to be invested, etc., apply to the undersigned.

F. COCHRANE,
Minister of Lands, Forests and Mines.
Toronto, Ont., Jan. 10, 1911. 3-7

Smoke-Dried Pine

The old saying that there is nothing gained without some loss, is verified in connection with drying yellow pine finish. We have lost the flavor and the deep, rich tone of the old "smoker" kiln, and, strange to say, now and then we hear people expressing regret over this loss and asking for the old smoke-dried stock in finish. Yellow pine finish carefully dried in the modern kiln comes out as bright and white as it was when it was freshly sawed and put into the kiln, whereas smoke-dried stock that is dried in the old-fashioned way, with a fire underneath and the smoke passing up through the lumber, has a sort of meat-frying smell to it, and has a deep yellow tone that is very beautiful for natural finish, and very desirable in certain classes of work. The old smoke dry kiln was a dangerous proposition, and much of the lumber itself went up in smoke. Yet it is possible to do smoke drying and be comparatively safe about it. There is no question of the attractiveness of the tone or the colour of yellow pine finish when it has been thoroughly and properly smoked.

There are two points in which red oak differs from white oak that gets special attention in the cooperage world. One of those is in the structure of the wood and the other is in the sap. There are certain properties of sap in red oak that differ from white oak, and there is even quite a difference in white oak. Some of the very discriminating buyers abroad insist on having just a certain kind or species of white oak, because they claim to get from it those acids or sap qualities that best combine with the liquid contents for such purposes as coloring or flavoring beverages. The main difference, however, that makes the white oak most sought after is in the structure of the wood. Red oak is more porous and it is difficult to fill the pores with glue or silicate so that it will hold oil or other penetrating liquids. It seems that the glue will come right through the wood. It is probable that some day a filler will be developed for red oak that will insure its holding just as well as white oak, and then with the development in chemical coloring and flavoring for beverages the difference between the two woods may disappear, because they will no longer need the char of white oak to give color to whisky or anything of that kind. This is not likely to happen suddenly, but as the white oak is cleared out and the trade is forced to use red oak, they will probably learn how to use it satisfactorily for all purposes and eventually it is likely that more money will be paid in the past for white oak cooperage, because timber will become scarce and more valuable.

Spliced Leather Belts

It has long been considered that the proper way is to put a spliced belt on the pulleys so that it runs with the splice or joint on the pulley side and against the splice on the outside of the belt, but I have found that this is not so. The inside can take care of itself, as the joint is kept smooth by the contact and pressure of the pulleys (especially is this the case where any belt dressing is used). It is always the outside of a splice that opens up and causes trouble. As it runs over the pulleys the tendency is to open the splice on the outside and close it on the inside. When once the thin edge starts to open the air is forced under it (as it runs thin edge first on the outside) and it soon becomes detached, so now I run my spliced belts against the splice on the pulley side, so as to offer no resistance to the air on the outside of the belt.—J. M. N.

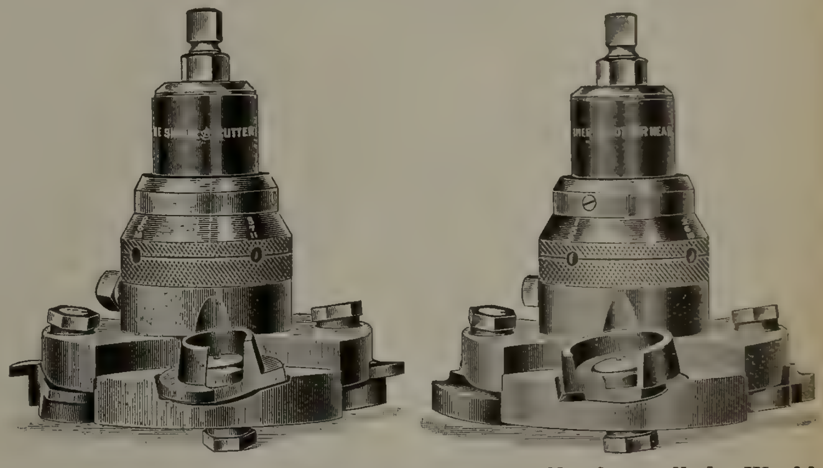
The Shimer Cutter Heads
Taken from the Solid Never-break Steel Forgings



Are the Strongest and Most Durable Cutter Heads in all the World

They are made with precision, care and judgement by skilled tradesmen in this line. Each cutter is fixed upon its seat, pitched for clearance, and as a result it works with the freedom of a saw tooth when set, producing outlines of lumber, accurate, clean and smoothly finished.

In the filing and fitting department The Shimer Cutter Heads for tongue and groove flooring are so easily sharpened with an ordinary three-cornered file and the Bits are so easily set to the gauge that a uniform size of tongue and groove is maintained until the full circle (tool cutting edge) of each Bit is used up. Duplicate cutters can be had promptly at very reasonable prices.

The dealer who accepts your order for the Shimer Cutter Head and supplies you with another means to deceive you in no small matter. Look for the Name and Trade Mark "The Shimer Cutter Head" stamped on every genuine tool. Any other is spurious—send it back—demand the genuine, of quality and helpfulness, with a record of 40 years of upbuilding and improvement. It costs no more.

Review of Current Trade Conditions

Ontario.

Trade conditions in Ontario have been steadily improving since the beginning of the year, and at present there is a general belief that when the spring season opens there will be a good demand and an active movement of lumber, such, indeed, as has not existed early in the year for a number of years back. Stocks of the good grades of white pine are very scarce. The demand for these has been good all through the past year, and with the good demand of the present season, the available supplies are rapidly disappearing. Before the new stock appears next summer, it is likely that stocks will have all gone into consumption. Dressing white pine is also growing very scarce, as there is a much better demand than is usual at this time of year. Even mill and dead culls are moving at better prices. Purchases of mill cull sidings have recently been reported on a Toronto basis of $16, whereas, the price a year ago was more like $14.

Lath are advancing in price and moving well. No. 1 white pine lath are worth $4.50 at Toronto. A year ago they were selling at $4. The fairly open winter is largely responsible for the improvement in lath, and also for the betterment in the shingle demand. Shingles have recently advanced in price 20 cents a thousand. XXX B.C. shingles are bringing $3.30 at Toronto.

Some sizes of hemlock are growing extremely scarce, and the prices of hemlock generally are showing a hardening tendency. A scarcity is reported in No. 2, 2x8, and 10-inch, 10 to 12 feet. Also there is rather a shortage of 1x8-inch, 10-inch and 12-inch hemlock stocks. The spruce situation is reported to have improved, and so has the demand for Norway pine. The enquiries for spring deliveries are good in practically all lines.

Eastern Canada.

The amount of spruce which is being cut in the Province of Quebec and in other parts of Eastern Canada this winter is reported as so great that it will be a drug on the market. It is believed, however, that market conditions are scheduled for an improvement, and that spruce will sell well if it is held for a while. At present, purchases are being made at as low as $7 per thousand. The demand, however, is strong, and some of the yards are paying good prices. Planks, for instance, are bringing $17, and larger sizes $20. There is practically no demand for the low grades. Good prices are being paid for cedar shingles, clears bringing $2.35 to $2.45.

In Nova Scotia, trade is reported as having brightened up a bit since matters have quieted down in the Old Country. Prospects are that good prices can be obtained for stocks to be shipped during the next three or four months. There is a general belief that deal prices will range much the same as last year, as the general trade of the country is in a good condition. A steady market throughout the year is expected.

The open winter which has prevailed at Boston has enabled many of the dealers to do a better business in spruce than is usual during the winter. The result is that yard stocks have been depleted, and many of the dealers are now thinking of replenishing. As a rule, however, the buyers at present are not interested in more than single carload lots. The general price now being asked for frames, 9-inch and under, is $22.50, although a few of the manufacturers are asking for $23. Sales, on the other hand, are reported to have occurred at a little less than $22.50. There is a moderate demand for random, and prices are unchanged. The demand for spruce covering boards is quiet. Hemlock at Boston is rather dull. An improvement has taken place in the market for shingles, and prices show a small advance. The best cedar extras are bringing at least $3.25, and some brands are being held at $3.40. Lath are a little weaker and in poor demand. The asking price for 1⅝-inch ranges from $3.75 to $3.80, and for 1½-inch from $3.35 to $3.40.

At New York the demand for spruce is irregular, and largely of a hand-to-mouth character. Buyers are still able to control the market for quick deliveries. The building outlook is slowly improving. Hemlock is a little stronger at New York.

Great Britain.

A number of Quebec shippers are now in Great Britain in connection with contracts for next season's stock. They report that the stocks wintering in Quebec constitute a new low record in practically every line except oak timber. The stock of waney pine is down to some 64,000, and though the quantity being manufactured this winter is likely to slightly exceed the small production of last year, there will, owing to the light wintering stock, be very little, if any more, available for export than was the case last season. The stock of rock elm is also reported light, with only three or four lots being manufactured this winter. Prices of both waney pine and elm are much in excess of those of last season. The market for birch is reported to be very strong for both timber and plank. Small waney pine has practically superseded square white pine.

The c.i.f. market for spruce deals on the west coast of Great Britain is in rather a peculiar position. Very little is being offered for forward delivery, shippers confining themselves to shipping parcels on consignment, for which the prices vary considerably, according to specification and quality. It is almost impossible, therefore, to gauge the real value with any accuracy. The spot market is not very reassuring. It is, in fact, quite quiet, and parcels arriving on consignment are consequently difficult to place except at prices much lower than shippers would care to make for forward contracts.

The demand at Manchester is improving, and liner parcels at present are not too plentiful, so that better prices are being obtained. Stocks of spruce deals at Manchester are very broken, it being almost impossible to obtain anything over 15 feet. Holders of spruce stocks at Manchester are making what hay they can while the sun shines. It is expected, however, that arrivals of liner parcels will check any extensive advance in prices of ordinary sizes. Special dimension stuff is, however, very scarce. Waney board pine is meeting with a fair trade at top figures.

The tone of the timber markets at Liverpool is somewhat more cheerful, and a good year's business is anticipated. Spruce shipments from Halifax have declined somewhat, and consequently there is no pressure to sell. It is reported that it would be a good thing if these shipments could be stopped altogether for a time, so that stocks on hand could be reduced. The c.i.f. birch market at Liverpool is as firm as ever. Practically no planks are being offered, though a few contracts for logs have been placed at good figures. The spot market is also firm, and stocks are extremely scarce, especially planks. Consumers of Canadian pine deals are finding that it is a losing game to wait for lower prices. Arrivals at present are only in small quantities. At London the spot market continues quiet. There is only a moderate demand, not enough to make anybody really busy.

Stocks of spruce at Manchester and Liverpool combined, on January 31, amounted to 17,060 standards, of which 10,380 were at Manchester and 6,680 at Liverpool. In 1910, at the corresponding date, the stocks amounted to 16,920 standards, and in 1909 they amounted to 21,090. Stocks of birch logs at the two ports were nil. Last year, at the corresponding date, they amounted to 540 loads. Stocks of birch planks amounted to 540 standards. Last year, at the corresponding period, they amounted to 1,745 standards. The stocks in each of these classes show an almost uninterrupted decline since 1907.

United States.

The lumber trade in the United States is making a good start this year, and reports generally state that conditions at present are verging towards the normal. This is encouraging operators, and they are taking a bright view of the prospects for trade after the spring demand opens. In spite of this, however, there is still a marked degree of conservatism in the matter of stocking up. A gradual increase in the general demand for the principal classes of lumber, however, is distinctly noticeable. The winter has been a favorable one, having been open enough to permit of a moderate continuance of building in many parts of the country. In the Chicago wholesale yards there is a steady increase in the demand for all classes of building material, and reports state that the country retail trade is also improving. The demand for northern pine is better than it has been at Chicago for some months. Stocks of No. 3 are light, and prices are firm. Lower grade stocks have been greatly reduced, especially No. 4.

The demand for hardwood at Chicago is improving daily. Plain oak is the most active hardwood, while red oak, firsts and seconds, are so rare that they can seldom be found. Quartered red oak is active, but quartered white oak is rather quiet. Upper grades of the northern woods are in good demand, and the prices are firm. This applies particularly to maple, beech and birch. Stocks as a rule are small. The demand for basswood is slow. Hemlock conditions are a little more encouraging at Chicago than they have been for some months. The demand is not heavy, but the enquiries are numerous, and there are those who are looking for an advance of from 50 cents to $1.50 some time in the near future. The improvement in the demand for yellow pine has had much to do with the better prospect for hemlock. Large quantities of yellow pine have been sold at Chicago on the new increased price basis. It looks as though the advanced prices of yellow pine were going to stick. The depression in the cooperage business at Chicago is reported to exceed that of any previous year.

Red cedar shingles at Chicago continue dull. White cedars are unchanged and firm. Lath are strongly held, and an advance would not cause any surprise.

White pine dealers at Buffalo are looking for an improvement in trade as soon as other classes of lumber begin to improve. At present, however, the amount of business in white pine is rather small. In the better grades there is a fair demand and the prices are firm, but in the lower grades the prices are weak. The box business is rather quiet, though makers report that the slump which usually comes at this time of year has not arrived. The hardwood trade at Buffalo is quiet, but prices are firm. The general impression is that it will pay to hold stocks for better prices a little later on. Hemlock is quiet at Buffalo, on account of the unfavorable weather, and the lull in building operations. Stocks are heavy and prices low. There is a fair demand for fir lumber at Buffalo, and the improvement in the prices of yellow pine is helping fir, with which it competes. An advance of about $1 a thousand feet is noted in the price of yellow pine at Buffalo. Trade is quiet.

A fair amount of business is reported in northern pine at New York. Enquiries for future deliveries are also satisfactory. Prices on the upper grades are better, and even in the lower grades there is a better feeling. The hardwood markets at New York are healthy in tone. Yellow pine at New York is depressed. Prices are low, and dealers can with difficulty make profitable sales.

Market Correspondence

Montreal Exporters Expect Record Year

Montreal, Feb. 11.—Although the export business to Europe is naturally dull, men engaged in connection with local and United States business report prospects for a record year. The demand for birch is far in excess of the supply, and prices have been steadily rising since the fall, the cut being forced further back into the forest and the cost of haulage naturally increasing. Large logs, which at the beginning of the winter were fetching $14.50 per thousand feet at the shanty, had jumped $2 by the middle of January, whilst one cutting of 4-inch logs brought as high as $18.50 this week.

That the limit has not by any means been reached, is the feeling expressed in many quarters, for the demand from across the border keeps constantly ahead of the visible supply, without taking the local market into consideration. Large cuttings of birch are reported from Wisconsin, and these compete favorably with Canadian shipments, but they are only in small sizes. The best shipment so far appears to have been to Chicago at $48.

Spruce is being cut to such an extent this year that it is spoken of in some quarters as a drug on the market, though optimistic dealers say it will fetch good prices in cases where it is held for a while. At present, it is being bought as low as $7 a thousand. This low price, however, is mainly due to the large supply, for the demand is better than at this time last year, and the lumber yards are paying good prices: from $17 for planks to $20 for the larger sizes being reported as paid by Montreal houses recently. The lower grades, however, find practically no demand, one big purchasing agent saying he would not touch a million feet of mill culls if they were offered to him for freight charges only.

Cedar shingles find good markets at $2.35 to $2.45 for clears, $2 for second clears, $1.90 for clear whites, and $1.15 for extra No. 1.

The recent storms have caused considerable inconvenience to the retail yards. the employees having to spend much of their time shovelling snow. Yards in exposed positions found it impossible to get at their stables, rigs and mills until many hours had been spent clearing away the snow, and when the rigs were dug out. they had to be utilized for carrying the snow out of the yard. Mill labor had to be used for this. for all the casual labor was monopolized by the city and street railway.

Good Logging Conditions in Ottawa Valley

Ottawa, Feb. 11.—Reports from the shanties indicate that lumbering operations were almost paralyzed for a few days as as result of the recent heavy snow storm. It was even more strenuous in the woods than it was in the cities, and the roads were badly blocked. However, this winter, until this storm came, was almost ideal for logging. There had been little or no snow to interfere once the ice roads had been formed. For that reason, the operations were so well advanced that this drawback did not affect things seriously. Most of the firms are taking out about the usual number of logs, and the smaller firms, if anything, a little more than usual. Taken all round, the stocks are pretty well sold up, and as money is quite plentiful, the smaller manufacturer, who is much guided by his finances, is in a position to get out a larger quantity of logs than usual. The big firms will, in most cases, take out about the same.

The manufacturers around Ottawa calculate that it takes a year to bring the logs down, and therefore any change in the amount of logs is not felt at the mills until the year following.

There has been considerable difficulty recently with regard to the water power at the Chaudiere Falls. There has been a great scarcity of water in the river. The engineers state that not for many years has the flow been so small. This has resulted in trouble with regard to the amount of water over the city intake pipe, and the epidemic of typhoid fever has inclined people to believe that this occurred because the power owners were using too much water, leaving it too low and compelling the city engineer to open valves nearer the shore, when there was any fire in the city. However, the great fault is not with the mill owners, but rather the size of the city intake pipe. The water above the dam at the Chaudiere had been kept as high and, as a rule, higher than it was before the dam was built. Efforts are being made to come to a definite understanding about the height at which the water above the dam shall be kept, and the mill owners have shown every willingness to curtail the use of the water when it is necessary for the welfare of the city. The low water has induced both the E. B. Eddy Company and J. R. Booth to reduce their operations at times, as much as 60 per cent. This chiefly affects the pulp industry of the two firms, as there is little or no sawing done during the winter.

The indications for the spring market in lumber are very bright. The smaller wholesalers, those who supply the Canadian demands and do exporting on a smaller scale, are receiving a lot of orders. particularly those who make a specialty of the better class of lumber and hardwoods. The indications are, they say, that building operations throughout the Dominion will be as heavy as, if not heavier than, they were last year, and most of the contractors seem to be prepared to stock up fairly well.

The planing mills in Ottawa anticipate a busy local trade. The indications are that there will be a lot of building here this year. As a rule, they seem to think that more commercial and other large buildings proportionately will be built than residences, and while in some of them lumber will not figure very prominently, in a great many cases it will. Residential building will be fully as large as ever. Contractors, as a rule, buy just as they need the lumber, and quite a number of them have already left orders for lumber to be delivered on the first of March.

Canadian Timber in the United Kingdom

Liverpool, Eng., January 25, 1911.—January is closing with a very fair demand for Canadian lumber at London, Liverpool, Manchester and Glasgow. Inquiries have come to hand on a fairly satisfactory scale, and importers are now looking forward to an improvement in prices at an early date. Spruce deals which have lately come to hand have sold privately, but in view of prices paid at the public sales, the prices received for consignments sold by private treaty can hardly have been remunerative. The spruce-deals branch of the trade is at present spoken of as the least satisfactory branch, as much timber of the kind has lately come to hand, to be sold at the best prices obtainable. The sales of these consignments have tended to keep prices low, and to cause merchants to wish that shippers would keep some of their surplus deals back until prices have improved. Apart from prices, business is better than it was a short time ago, and, as far as spruce is concerned, quantities coming to hand find ready purchasers. At London, Liverpool, Manchester and Glasgow, a very fair demand for spruce exists at the time of writing. The later arrivals have been from St. John's and Halifax, and have quickly found purchasers.

With regard to the sizes of timber which have found a ready sale, it may be stated that Quebec pine, 3 x 11 of 4 h.y. classification, has sold at £11 5s. and £11 per standard; 3 x 8, dry, 2nd y., at £15, and 3 x 7 at the same price. Quebec pine of 4th quality, 3 x 11, has sold at £11:2:6, and 3rd, red, 3 x 6, at £8 10s. The ordinary quotations for Quebec pine are, 1st quality, £22 10s. to £36 10s. per standard; second quality, £16 15s. to £26; third quality, £13 10s. to £17. Quebec spruce, 9 x 3, of 19 and 20 feet lengths has sold at £10 15s. per standard, and 11 ft. at £9 15s. Fourth quality, 13 ft., has sold at £9; first quality lots, 3 x 8 have brought £14 10s., and 3 x 7, £12 5s. In other sizes, 3 x 5, of 9 ft., has sold at £7 15s.; 3 x 8 of 11 to 13 ft., at £14 10s.; and 3 x 7 of 10 to 13 ft., at £12 15s. Dry third quality, 3 x 9, of 11 ft., has sold at £9 15s., and of 13 ft., at £10; and, 3 x 7, of 10 to 14 ft., at £8 5s. St. John's spruce, 3 x 9, unassorted, has brought £9 5s.; 3 x 8, £8 5s.: and 7 and 6 in., £7 15s. per standard.

At Manchester, spruce, 3 x 7 and 3 x 8, has lately sold at £8 12s. 6d. to £9; 3 x 9 and 3 x 10, at £9 5s. to £9 12s. 6d.

At London, Montreal pine, 3 x 11, seconds of regular lengths, has sold at £21 15s. and £21, and 3 x 9, dry seconds, red pine. at £12 15s. Unassorted has sold at £10 5s. to £9 15s. per standard.

At Manchester, Liverpool and Glasgow a better feeling prevails. At each of these cities trade generally is more active than it was a

TALK No. II.

NOW YOU REMEMBER

that in Talk. No. I we said that 30 years' of experimenting and concentration on Waterproof Leather Belting must inevitably bring forth a result of rare quality.

We spoke truth. The

"AMPHIBIA"

Wateproof Leather Belt

is entirely satisfactory where belting is required to resist dampness. Just that—entirely satisfactory—no high flown adjectives are needed.

You may ask "How do I know this is true and not one of those senseless exaggerations which sometimes creep into ads?"

BECAUSE in the last two years we have shipped thousands of feet of it to all parts of Canada, and not a single complaint has come through.

Why are we willing to let our reputation stand or fall by AMPHIBIA?

Because the whole process of the manufacture of AMPHIBIA is in our hands. Yes Sir, we are busy putting merit into that belt from the moment a good sound hide is taken from a heavy steer to the moment it is AMPHIBIA.

AMPHIBIA is made in Heavy Single, Light Double and Heavy Double.

There are also AMPHIBIA PLANER and AMPHIBIA THRESHER.

More about these next issue. Cut these talks out and you'll get to know something about BELTS.

few months ago, and the timber trade has felt the improvement. This has produced a better tone in the timber market, and prices tend upwards at the time of writing.

Pine deals of the best quality have been scarce at Glasgow and the inquiry for such is well maintained. The poorer qualities have however, moved slowly, and the prices of these are low. Generally, however, the tendency is upwards and a higher run of values is eagerly awaited.

Furniture makers continue to be well employed. They are the principal users of first and second qualities of yellow pine, and a large and steady consumption of timber of the classes named goes on among them. In the making of the cheaper kinds of furniture, practically no first quality pine is used at any stage, and in some of the cheapest furniture little wood of second quality. Paint is freely used on such goods, and for painted surfaces, anything which is sound and free from knot-holes, serve sfor the time being; that is, until the goods can be sold to some uncritical purchaser. On the other hand, a good deal of spruce is used in making very cheap furniture. Kitchen side tables, "dressers" as they are termed in England, and kitchen centre tables, are made largely, if not wholly, of spruce. A "dresser" top will be finished to 1-in., 1⅛-in., or 1¼-in. thickness, as it may be. This, excepting the legs, will be the most substantial part of the structure. In first-class furniture, the top would be of sycamore, 1⅛ in. or 1¼ ins. in thickness, finished. Rails, drawers and legs would be of first quality wood, possibly of selected second quality. In the cheap furniture, these parts would be of third quality pine, or of spruce, the legs being of spruce; 3 ins. x 3 ins., almost certainly. Notwithstanding this large use of low quality pine and of spruce in the making of soft-wood furniture, a large amount of first quality pine is used in making furniture of the better class, even though the white wood surfaces will be covered by leather, leather-cloth or veneer. Tables or desks, which are to have veneered or leather covered tops, and to be finished off creditably, have tops of first-quality pine, well-seasoned and carefully jointed. Work of this kind is done largely and maintains a good demand for first quality wood. The cheap furniture trade is, however, of great extent in the United Kingdom, and represents a steady consumption of pine of second and third quality in 1 inch and 1⅛ inch boards, and of spruce, as aforesaid.

Consumption of Poles During 1909

Statistics of Output—Great Increase in Purchases of Poles —Cedar Poles the Most Popular—By H. R. MacMillan, M.F.

The following figures for the quantity of poles purchased during 1909 were received from the telegraph, telephone, electric light and power companies, and electric and steam railroads operating in Canada. The figures fall a little short of the total for telephone companies, as there are a large number of small rural telephone lines from whom it has so far been impossible to secure returns. Almost without exception, these lines use stout cedar poles.

The total number of poles reported as purchased in Canada during 1909 was 358,255. The total value at the point of purchase was $497,052. The purchases in 1909 were 92.9 per cent. greater than in 1908. The large increase of 172,448 poles was entirely due to an increase in the purchase of short cedar poles by the telephone and telegraph companies. It is for this reason, the large increase in the proportion of short cedar poles used, that the average price of all poles used fell from $1.53 in 1908 to $1.39 in 1909.

Cedar Poles the Most Popular.

Cedar is the wood most frequently used for poles in Canada, as it is practically the only Canadian wood growing to a convenient pole size which is cheap, easily handled and durable. There were 338,366 cedar poles purchased in Canada in 1909, or 94.5 per cent. of the total. Larch, furnishing 4.5 per cent. of the total, stands next in the list. The remaining 1 per cent. is made up of spruce, Douglas fir and poles of unspecified species. The latter are, on the average, more expensive because a large proportion of them belonged to the higher length classes. Accompanying the great increase in cedar, there was a decrease in the use of larch, spruce and Douglas fir for 1909.

Telephone and telegraph companies are the greatest users of poles. They bought 83 per cent. of the poles used in 1909. The use of poles by these companies was 141.8 per cent. greater in 1909 than in 1908. The increase was all in cedar.

Steam roads used 11.9 per cent. of the poles purchased in 1909. They purchased 2,131 fewer poles than in 1908. The demand from the electric roads, power and lighting companies, the least important users, was about the same in 1909 as in 1908. They account for about 5.1 per cent. of the pole consumption in Canada.

Where sufficient quantities of each species are purchased to afford a basis for value, as the 20 to 25 foot class, spruce poles were cheapest, then cedar, larch and Douglas fir; the latter most expensive. This in itself would explain the great popularity of cedar, for it gives, for the money, more service than any of the other woods used.

The prices paid for poles ranged from 79 cents each, for spruce poles, 20 to 25 feet long, to $6.71 each paid for poles of unspecified species, 41 feet long and over.

In every length class nearly all the poles were cedar. Spruce also appears in every class, but neither larch nor Douglas fir were used over 35 feet in length.

Poles 25 feet long or less compose 77.5 per cent. of the total number of poles used in Canada. About 86.1 per cent., or 308,577, of the poles purchased in 1909 were 20 to 30 foot cedar.

Excepting in the length classes, 36 feet and over, cedar poles were more expensive in Canada than in the United States.

The Importance of Preservative Treatment.

Even with cedar poles cheaper in the United States, many companies have found it economical to give poles, both those of cedar and other species, a treatment with a chemical preservative, so as to prevent decay and lengthen the life of service received from the pole; 10.6 per cent of the poles used in the United States in 1908, 344,388 altogther, were given such a treatment. The steam railroad companies of the United States treated 30.9 per cent. of the poles they purchased in 1908, the electric companies 14.7 per cent., and the telephone and telegraph companies, 8.5.

This preservative treatment, though hardly in the experimental stage in Canada, has become a settled procedure of economy in the United States, where it has been the subject of extensive investigation by the Government for many years, and where are now in operation 83 commercial plants for the treating of timber.

The treatment consists first in the seasoning of the wood, then thoroughly impregnating it with some preservative. The preservative that has been found to give the best satisfaction is creosote, a heavy oil which is a by-product of the manufacture of coal or petroleum tar.

A thorough creosote treatment costs about $1.40 a pole, assuming that labor is $1.75 per day, creosote 8 cents per gallon, and fuel $15 per cord. At this rate it pays to treat cedar poles. The annual charge on untreated cedar poles, costing $9 net in the line, and lasting twelve years, is in the average given by Canadian users, 6 per cent.; $1.07 treated cedar pole will cost $10.39 set in the line, will last twenty years or more, and will thus cost only 91 cents for each year of service. This is an annual saving of $6.40 on each mile of line.

The preservative treatment of poles has many features to recommend it in Canada. The supply of cedar in Canada is comparatively small; cedar grows so slowly, 175 to 200 years are required to produce a 30-foot pole, so that it is by no means reproducing rapidly enough to supply the annual demand. The preservative treatment of the cedar poles used would both save money for the pole users and lessen the annual drain on the forest. Preservative treatment would also render available for efficient pole use cheaper woods, such as pine and spruce. These woods can be purchased more cheaply than cedar, and when treated give as long and satisfactory service. They are much more plentiful than cedar, and for that reason should be used if possible.

Experiments which could be conducted would probably demonstrate that preservative treatment would render available for pole use in the prairies the fire-killed Engleman spruce and lodgepole pine of the eastern slope of the Rocky Mountains. This timber is sound, strong and well seasoned. It exists in fairly large quantities, has been satisfactorily treated in the United States, and there is every indication that when so treated it would make as good and better poles than cedar. It stands in good pole sizes, and is more convenient for the extensive prairie market than the poles now brought from the East. At present it is going to waste, save when used for running timbers.

Canadian Carriage Stock In Australia

The Department of Trade and Commerce, in its weekly report, contains the following from the Trade Commissioner in Australia:

The close attention of United States manufacturers of carriage wood stock to the requirements of the Australian trade has resulted in their securing the bulk of the business. Importers for a number of years have proved the goods as being—in the main—satisfactory in price and quality. Buyers have become conservative in regard to new brands from experience gained in occasionally handling goods obtained outside the usual channels.

Until recently Canadian makers of carriage wood stock were apathetic, and the Australian market appeared of little interest to them. This year the direct representatives of two Ontario manufacturers have been over the territory with varying success in different centres. One traveller was ordered by his principals to meet competition from other sources, and, considering the line was unknown, he secured fair initial business. The other traveller was not so successful, as he lacked the support and latitude essential to obtain intro-

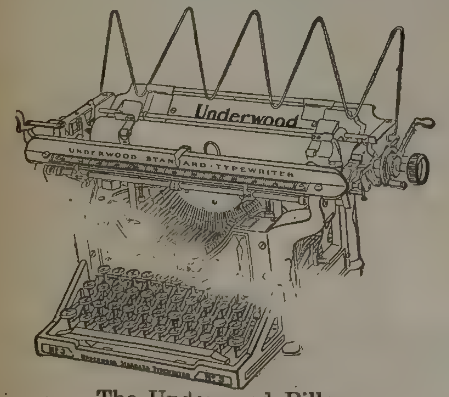
Limited
Board of Trade Building, MONTREAL



The Underwood Biller

One Girl and an Underwood biller do all the billing for a firm with over 5000 active accounts.

Another firm effected a direct saving of $2500 a year by installing one Underwood Biller.

Let us consult together.

United Typewriter Company, Ltd.
Toronto Montreal Winnipeg
Hamilton, London, Halifax, St. John, Edmonton.

EDGINGS

Ontario

The Belding Lumber Co., Ltd., Toronto, are reported to have assigned.

D. C. Baird, manufacturer of boxes, St. Mary's, Ont., is advertising his business for sale, it is reported.

P. W. Gardiner & Son, of Galt, Ont., have decided to erect two more additions to their plant this year, one immediately, to enlarge the glue room.

The Standard Chemical Iron and Lumber Company of Canada, Limited, Toronto, has been incorporated, with capital of $6,000,000. The incorporators are J. Wood and T. W. Lawson, barristers, both of Toronto.

The George N. Kernohan Lumber Company, Limited, London, Ont., has been incorporated with a capital of $40,000. The incorporators are G. N. Kernohan, lumber merchant, and J. M. McEvoy, barrister, both of London.

The Dominion Cooperage Company, Limited, Brigden, Ont., whose plant was recently destroyed by fire, have placed orders for their new machinery and expect to begin rebuilding this month in order to have the mill going in the spring. They will continue to make a full line of cooperage—staves, heading and hoops.

An order winding up the Belding Lumber Company, of Gerrard street, East Toronto, has been granted by Mr. Justice Sutherland. G. T. Clarkson is named interim liquidator, and a reference is directed to the Master in Ordinary. The company's nominal stock is $40,000. The assets are placed at $18,000, and the liabilities at $20,000.

The Durable Box Co. has been incorporated with a capital of $40,000. The head office is in Toronto, and the company is empowered to manufacture and deal in paper and other boxes, card boards, wooden and fibre goods. The provisional directors are O. H. King, T. W. Webb, R. J. Dickinson, J. H. Phippin and N. S. Macdonnell, all of Toronto.

What proved to be the largest load of logs delivered in Owen Sound this season, or possibly any other season, was delivered in the yards of the John Harrison & Son Co., recently, by Mr. Alex Johnston of Derby. The load was made up of six soft elm logs which scaled 2,098 feet, and would weigh between ten and twelve tons, and was hauled from near Woodford, a distance of ten miles.

The Dryden Timber and Power Company, of Dryden, Ont., have drawn up the plans for their new mill site. The plans provide for a new building 400 feet in length and varying in width to 250 feet, which is to include shipping rooms, screens and wet machines, digester and bluing tanks, acid and making rooms, wood and boiler rooms. A log conveyor will carry logs to an adjacent cutting up mill, 50x30. The architects are the Fibre Development Co., of Appleton, Wis.

Eastern Canada

The Eureka Lumber Co., Ltd., Bathurst, N.B., are applying for a charter.

The Louisa Lumber Co., Lachute, Que., composed of Arch. McFaul, W. McFaul, J. McFaul, H. Morrison and W. Bery, have registered.

L. Villeneuve & Cie, Ltd., lumber merchants, Montreal, have registered. L. Villeneuve is president.

Blackadar & Blackadar, manufacturers of lumber, Millville, N.S., have formed a partnership.

The Private Bills Committee of the House of Commons has passed a bill authorizing the E. B. Eddy Company to increase its capital to $5,000,000.

The Quebec Pulp & Paper Company, Limited, Montreal, Que., has been incorporated with a capital of $15,000,000. The incorporators are C. G. Greenshields and E. R. Parkins, advocates, both of Montreal.

Hayden's sawmill and wood-working factory, at Woodstock, N.B., were destroyed by fire on January 31st, with a large quantity of boards ready to ship. There was no insurance. This is the fourth time the mill has been burned, and it will be rebuilt.

Since the middle of November there has been excellent sleighing in the district near Glassville, N.B., and so far the lumbermen have had an unusually favorable season. At the present time every available team is in the woods rushing the hauling of timber.

The British Canadian Paper Mills, Ltd., Montreal, Que., have been incorporated, with capital of $500,000. The incorporators are Hon. T. H. Berthiaume, publisher; P. Lacoste, advocate, and T. Bienvenu, bank manager, all of Montreal, Que.

The North American Fish and Game Protective Association, at its recent meeting in Montreal, passed a resolution recommending that railways be required to electrify those sections of their lines which pass through forests, in order to lessen the danger from fire.

The Davison Lumber Co., of Bridgewater, N.S., propose to build a railway to carry lumber from Caledonia to Port Medway, Queens County, a distance of 29 miles. They offer to equip it, also, for passengers if the local government will grant the usual subsidy.

Joseph R. Clarkson, manager of the Edward Partington Pulp and Paper Company, Limited, St. John, N.B., reports that the company's paper mill will be erected in the near future. Mr. Clarkson has recently returned from England, where he went to discuss the matter with Mr. Partington. The plans for the mill are at present being prepared in the Old Country.

Negotiations are reported to be progressing satisfactorily for the sale to New York capitalists of the Anglo-American Development Company's large timber land interests in Labrador. The property embraces 13,853 square miles, or 8,865,000 acres, about equal to the area of the State of Massachusetts, or to the entire area of the timber lands of Maine.

An order has been issued for the liquidation of the Guay Lumber Company, Limited, of Montreal, for the benefit of its creditors and shareholders. The application was not contested by the company, a minute being submitted of a meeting of the directors, where it had unanimously decided that it was in the interests of the shareholders and creditors of the company that its affairs should be wound up.

The Campbell Lumber Company, of Weymouth Bridge, N.S., whose plant was destroyed by fire on January 23rd, will commence rebuilding as soon as they have completed the details of their plans. They are undecided at present whether to install a pulp mill or a power plant, but will probably decide in favor of the pulp mill. It is expected that the building will have concrete foundations, with steel superstructure and corrugated iron. If it is decided to put up a pulp mill, a modern plant will be installed with the latest improved wet machines, screens, etc. The company's dam, flumes, water wheels and grinders are still intact, not having been injured to any extent by the fire. They also intend to install an up-to-date saw mill in connection with the proposed pulp mill.

Judge Barry, of Fredericton, N.B., has granted an order to allow the liquidators to grant an option on the property of the Miramichi Pulp and Paper Co. for three months at $345,000. According to the terms of the option, $15,000 is to be deposited within thirty days and if the option is not executed within three months this amount will be forfeited. An order was also passed authorizing the liquidators to reimburse Mr. George Keeyes of the Nashua River Paper Co. to the amount of $8,100, which he is advancing to pay the overdue wages of the men of the Miramichi Pulp and Paper Co. Mr. W. B. Snowball, of Chatham, one of the liquidators, is leaving for England in a few days to interest English capitalists in the industry. It is understood that several Canadian and American capitalists are becoming interested, although the representatives of the company state that the time has not yet arrived to make the names public.

A meeting of the Canadian Wood Pulp Association was held in Montreal a few days ago, at which reports were presented by the president and the various committees. The meeting was very largely attended, owing to the interest allowed in regard to the proposed tariff changes in regard to pulp and paper. The members of the association were unanimous in their opinion that it would be unwise for Canada to open her pulpwood resources to the United States. The consensus was that nothing would come of the proposed tariff changes owing to the fact that the provinces controlled their pulpwood areas and would refuse to forego their rights. The total production of mechanical wood pulp for the year ended December 31, 1910, was reported as 267,000 tons, or about 900 tons a working day. The mills contributing the largest proportion of this total are the Chicoutimi Pulp Co., 41,000; Spanish River Pulp & Paper Co., 36,000 tons; Brompton Pulp & Paper Co., 29,000 tons; Sault Ste. Marie Pulp & Paper Co., 28,000 tons; James Maclaren, Limited, 24,000 tons.

Robert Connely, manager of the Penobscot Lumber Co., whose head office is in Brunswick, Maine, has returned to St. John, N.B., from an extended trip, which included Washington, Albany, the Adirondacks, Yale University and other places, where he looked in to the question of reforestration, a matter which is of the utmost importance to New Brunswick, and which his company is going to take up in connection with its lumbering operations in this province. Mr. Connely, under the guidance of experts in this line of work, made a thorough examination of the forestry work of New York State and of Yale University, and visited also the American National Forestry Bureau at Washington, and he returns not only armed with a satisfactory knowledge of the best American methods, but enthusiastic as to the real good that may be done by applying those methods with such variation as may be required by local conditions. He has been authorized by his company to prepare for a start in reforesting some of the New Brunswick lands on which the company operates, and this year he will establish nurseries on a modest scale at Salmon River and Marins Head. The company will also establish one at Cookshire, Quebec, where it has 50,000 acres. They will plant trees from the seeds.

Western Canada

Finch & Jones, lumber merchants, Corbin, B.C., are stated to have been succeeded by the Riverside Lumber Company, Limited.

The B. C. Gazette gives notice of the incorporation of the following companies: The Interior Lumber Company, Limited, capital $20,000; Iowa Lumber and Timber Company, Limited, capital $250,000; Oliver Scrim Lumber Company, Limited, capital $100,000.

The plant of the Jarvis Inlet Lumber Co. at Ladner, B.C., near the mouth of the Fraser River, was totally destroyed by fire on February 1. The cause of the fire is unknown, but when the blaze was discovered so much headway had been made that there was no chance of saving the building. The offices alone were saved. The loss will be in the neighborhood of $20,000, almost wholly covered by insurance.

At the upset price of $3,759, the amount of dues still unpaid, the Waterways railway timber, including ties, fence posts, telegraph posts, etc., seized for default in dues, and valued at $35,000, was offered for sale by public auction at Edmonton on February 7 at the Dominion Land Office. It is possible that private tenders may be given by representatives of the Canadian Northern Railway, which is the nearest line to the point where the timber lies. The timber was offered in two sections, on the first of which a total of $2,905 in dues was overdue, and the second a total of $854.44 overdue. The lack of interest was chiefly due to the fact that the timber lies so far from the nearest railway that it would be very unprofitable to handle it. The bulk of the timber lies 23 miles east of the Athabasca Landing line of the Canadian Northern and 35 miles north of the main line of the C.N.R. The cheapest tender which Dr. McInnis was recently able to secure for hauling the timber to the railway line was 40 cents per tie, and an equal figure for the other portions of the cut. Much of the timber too, has been damaged in one way or another chiefly by fire.

Trade Enquiries

The Dominion Government Trade and Commerce reports contain the following trade enquiries. Readers of the "Canada Lumberman" may obtain the names of enquirers by writing us, enclosing stamped envelope, and stating number of enquiry.

128. WHITE PINE LUMBER.—A firm in Colombia, South America, wishes to be placed in communication with Canadian exporters of the above article.

108. TIMBER AND WOODWORK.—A north of England firm dealing in timber and woodwork desires to hear from Canadian manufacturers wishing to do business in Great Britain.

86. MAPLE DOWELS.—A London firm who are in the market for supplies of maple dowels invite quotations from Canadian manufacturers. Sizes required: 7/16 inch, 7½/16 inch, 8/16 inch diameter; 30 inches, 31 inches and 32 inches long. 12/16 diameter; 32 inches long. Dowels must be made from best hard wood, free from flaws or knots. Quotations, c.i.f., London.

91. SOFT ELM BOARDS.—One of the largest firms of timber importers in Liverpool, England, is anxious to get in touch with Canadian shippers of soft elm boards in the following dimensions: 1 inch x 13 inches and up wide (with all the wide in) 1st and 2nd grade soft elm boards in lengths of 6½ to 8 feet and 13 to 16 feet, principally the latter range.

KEBO
BALATA BELTING

is recommended in preference to all other belts for its

Perfect Uniformity
Exceptional Strength and Durability
Straight and Steady Driving

Every Belt is thoroughly stretched and seasoned before being sent out and is fully guaranteed.

Not altogether what we say but what Users say

"We have used the Alligator or Warping Tug manufactured by you for the last 7 or 8 years, and consider them indispensable to lumbermen on waters of French River or similar streams."

Will move a bag containing 60,000 logs, in calm weather, 30,000 in a head wind.

WEST & PEACHEY
SIMCOE - - - - ONTARIO

ductory indents. When manufacturers send a traveller 10,000 miles away, he should have some discretionary powers in meeting the proved competition of business rivals. The object is to secure the first order, after which the quality of the goods may prove superior to the brands now holding the trade, and better prices are then more readily obtainable.

In a third instance, the Autralian agents were supplied with unsuitable samples and prices were too high, thus causing the loss of valuable time. Imported wood stock enters largely—in some cases entirely—into buggies and light rigs constructed by Australian carriage builders, and this trade will continue for the reason that there is no indigenous timber suitable for such purposes. The recent enterprise of Canadian manufacturers should result in making satisfactory connections with leading importers and a consequent expansion in trade.

Importations of carriage wood stock into Australia comprise high and medium grades suitable for ordinary buggy, carriage and light wagon construction. Well-seasoned wheels (of which "the sarven" type is in most demand), hubs, spokes, shafts, rims, bows and k.d. carriage bodies, are heavily stocked by importers. Axles, springs, undergears, hoods, lamps, dashes, whips, whip sockets, steps and minor parts of coach-builders' hardware are a necessary complement to the wood stock. The trade lost to Canadian exporters of finished buggies is, to some extent, compensated for by the large market offering for wood stock and parts. In these hardware lines some Canadian makes already enjoy capable representation.

There is no prejudice with regard to the source of origin of vehicles imported into Australia. Given equal prices, there is always a desire to obtain supplies within the empire, but price and quality are the main features. Canadian—alike with United Kingdom—goods are assured of a sympathetic field to exploit in Australia on the basis indicated.

Causes for the Low Prices of Southern Yellow Pine

In view of the continual complaint among Canadian lumbermen that their markets are depressed by the competition of yellow pine from the southern States, it is interesting to read the opinion of C. S. Keith, a prominent member of the Yellow Pine Manufacturers' Association. In an address delivered before the association at its recent convention Mr. Keith referred to the present situation and to the causes of the low prices which have prevailed for some years, as follows: "This year, in the absence of a general depression of business, the consumption of lumber should overrun the production of it, and from the figures quoted it appears that the large stocks of lumber in the hands of the retailers January 1 last year was the direct cause of the unhealthy prices which we secured for lumber during 1910, inasmuch as the retailer was in a position where he could hold in reserve his orders, keeping the supply and demand closer together, furnishing the excess demand from his stocks on hand, and having the effect of generally demoralizing our price situation. This situatio has changed, as their stocks are less and our stocks are broken.

If every saw mill in the South should operate every day in the month, with the exception of Sundays and the first and third Wednesdays of each month, in other words, should curtail its production two days of each month, the effect would be to create a stringency in the supply of lumber, with advancing prices.

In conclusion we can sum up the situation as follows:

The production of the South has increased rapidly until it has reached practically 50 per cent. of the total production of lumber in the United States.

The stumpage areas in the South are becoming depleted at the rate of 3,152,000,571 acres per annum.

The population of the United States is increasing 1,512,000 a year.

The consumption is increasing at the rate of 750,000,000 a year, in view of the decreasing supply of timber, the increasing population of the United States, and the increasing demand for lumber, should be productive of higher values, not only on timber but lumber as well, and show better earnings for all.

In the face of the foregoing conclusions the greatest trouble we have had to contend with in 1910 has not been overproduction or underconsumption but has been due to the fact that our sales departments have been too ambitious to make sales, and the managers of the properties have not given to that branch of the business sufficient supervision, and have been working on the penny-wise-and-pound-foolish theory that the only way to make money out of the business was to reduce their costs of manufacture, and have been permitting their sales departments to give away not only what they have saved in the manufacture of lumber but several times more. What we need during 1911 and each succeeding year is to have more attention paid to the distribution end of the business than has been given to it for the last four or five years."

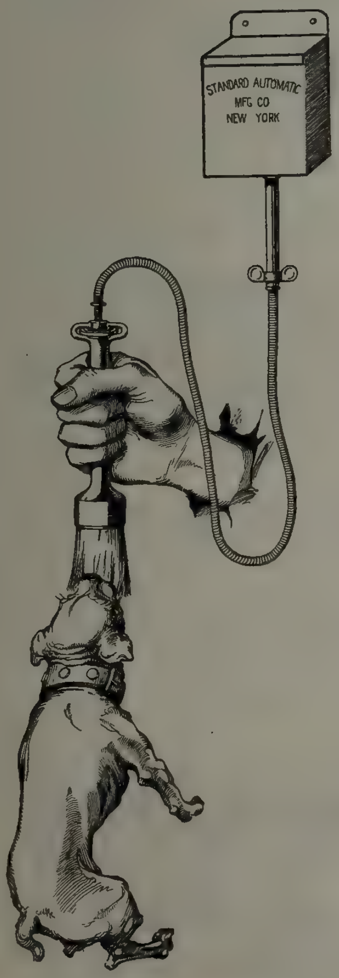
THE

Standard Automatic Brush



does your painting work in a new way, better, quicker, cheaper, eliminating all waste of paint. An equal flow at all times; thickness of coat can be accurately adjusted. Absolutely clean and fireproof.

THE STANDARD AUTOMATIC SYSTEM

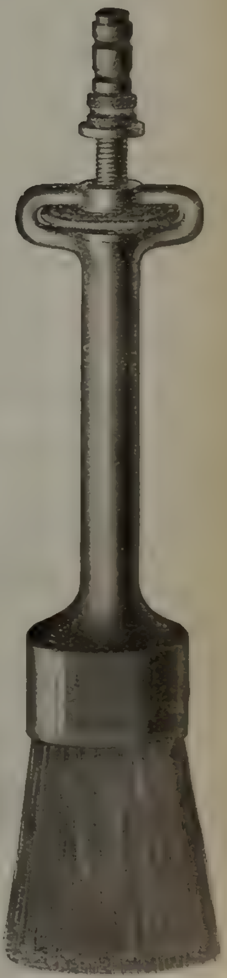
does away with the paint can. It eliminates the dip and is far superior to the spray, but it does rub it in. No air pressure is needed. Will work with any kind of paint. Get next to this method. Made especially for manufacturers of automobiles, automobile bodies and wheels, all kinds of vehicles, carriages, etc. It is most useful for manufacturers of furniture. It will also save a lot of time in painting structural work, such as bridges, elevated roads, etc. House and sign painting can be done effectively and quick.

Wherever duplication of work exists, this device will increase your output and reduce the cost. Buy just one outfit to-day and be convinced. We are sure that we will have to equip your entire plant. Special equipments can be made to suit your purpose.

Complete outfit consisting of a large paint tank, either stationary or movable, with automatic valve and six feet of flexible tubing together with the automatic adjustable brush made of aluminum, costs $7.50, and it is still cheaper than the ordinary brush.
The outfit is also made with a tank to be strapped on the back which will cost $2.50 extra.

Our booklet will tell you why. Write for one to-day. Send in your order. Your outlay will only be once. Apparatus will last a life-time. Let us know to-day what you are manufacturing and we will effect a saving for you.

Jobbers and Dealers wanted everywhere.

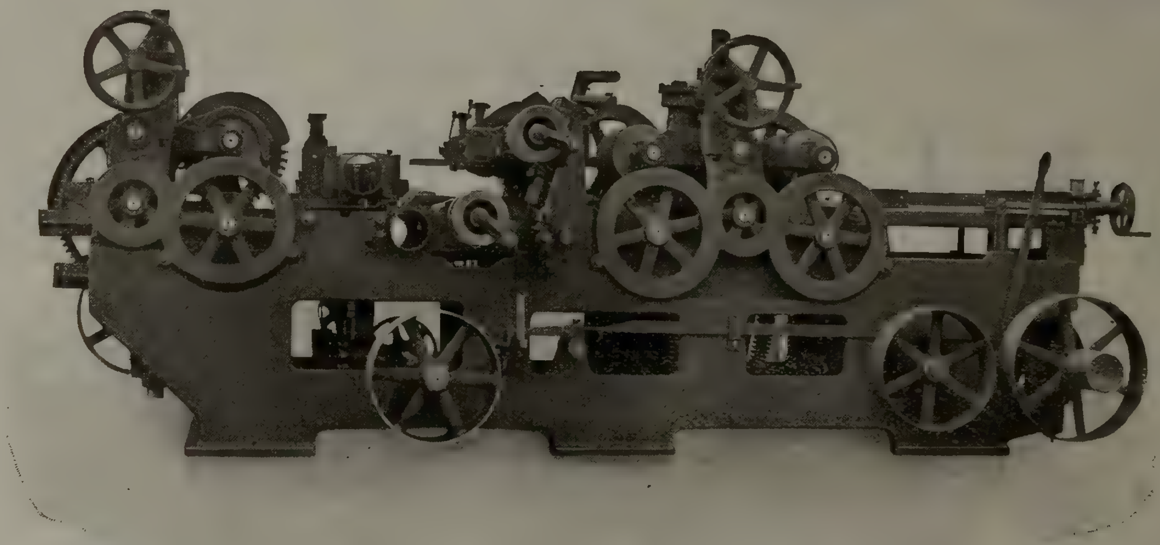


Standard Automatic Manufacturing Co.

50 Church Street NEW YORK

Canada Machinery Corporation
LIMITED
GALT, ONTARIO

This name on your woodworking machinery is a guarantee of quality and represents the best and most modern.



No. 105 Double Cylinder Planer and Matcher

The above cut shows our latest general purpose matcher and challenges comparison with any medium weight machine on the continent. It is very simple and rigid and easy of operation.

NOTE—The guarded gears and the belt drive to feed rolls.

Canada Machinery Corporation
Limited

Williams & Wilson, Montreal

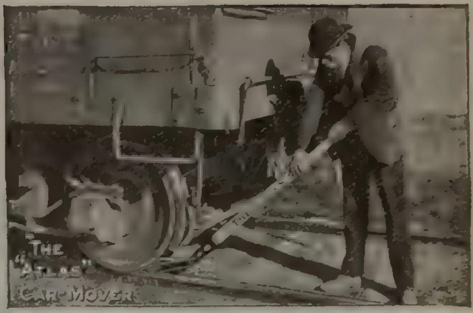
Twelve men *trying* to move an *empty* car

"Atlas" Car Mover

Patented in Canada in 1901

As shown by the accompanying illustrations will save your mens' time and your money. If it takes twelve men to move an empty car how many will it take to move a full one—it will take one man and an "ATLAS" CAR MOVER.

It is a small inexpensive article and every lumberman should own one. Can be shipped from Woodstock.



One man *moving* a *loaded* car with an "ATLAS" CAR MOVER

W. McLeish, - Appleton, Wisconsin, U. S. A.

Universal Barrel Machinery

Makes Barrels, Half Barrels, and Tubs of matchless quality, for all requirements, at a greatly reduced cost, from oak or 19 other woods, from tree to finished package; profitable capacity, 300 Barrels or more daily.

All inquiries should specify class, quantity and size of packages to be made.

Manufacturers and Builders of Saws, Tools and Machinery

For the manufacture of Staves, Heading, Barrels, Kegs, Cooperage, Pails, Tubs, Churns, Hoops, Woodenware, Short Box Boards, Chair Stock, Handles, Fish Kits, Shingles and Lumber.

Complete Plants our Specialty

The Peter Gerlach Co.

Cleveland, Ohio.

The

Algonquin Steel Range

for Lumber Camps

Can be fitted to burn Wood, Coal or Coke

A durable, strong well made Range specially adapted for Lumber Camps, and possessing all the latest features in an up-to-date Range. Is a quick heater and a good baker. One of the many advantages to the cook is the one piece Drop Oven Door.

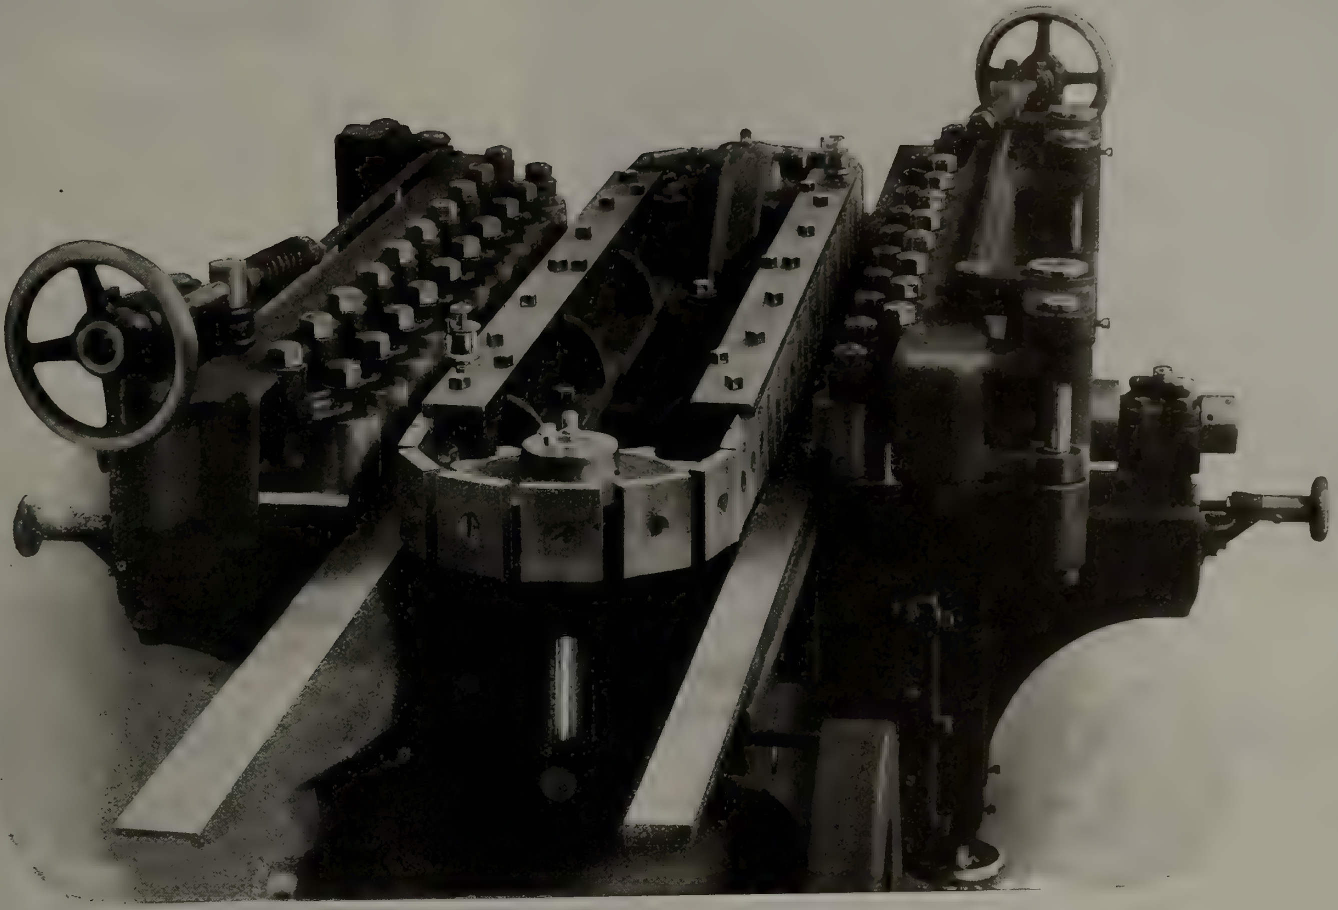
Berlin No. 213 Glue Jointer



Your Conception of a Glue Jointer

There was a time when we didn't make a glue jointing machine.

During a conversation between one of our branch office managers and a furniture man who had bought several of our sanders, the later stated that he had just bought some new machines.

Their conversation follows:

"What did you buy?"

"A couple of glue jointers from So-and-So."

"Do they make a good machine?"

"Oh, as good as any. But, do you know, none of them are what I want. Why don't you people make one."

"Tell me what you expect of it, and perhaps we will."

"Well, I want a machine first, that will handle short stock up to, say, six feet long and handle it four or five times as fast as we can handle it on a hand feed machine. Next, I want a feeding mechanism that will be absolutely positive, that will hold the stock firmly so it cannot slip backwards, jump forward or raise up. Then I want the working parts accessible and some sort of a lever so the machine can be started and stopped instantly from the infeeding end.

"Now, if you will make such a machine and mount it on a one-piece base to prevent vibration, you can have my order for several."

Isn't that **your** idea of what a glue jointer should be?

It describes, with one exception, our No. 213.

The exception is this:

Instead of an output of four or five times as great as a hand-feed machine, our No. 213 has an output **eight times greater.**

The automatic feed makes this possible. It is the one feeding mechanism which provides maximum output yet is absolutely accurate and positive.

Every provision is made for making quick adjustments. A lever at the in-feeding end starts and stops the feed. The cutter-head carriages are adjustable in three directions, providing for perfect alignment with the feeding mechanism.

The four-page folder of the No. 213 goes into detail regarding construction, and contains several pictures. Send for a copy—**to-day**—and learn how to cut your glue-jointing costs.

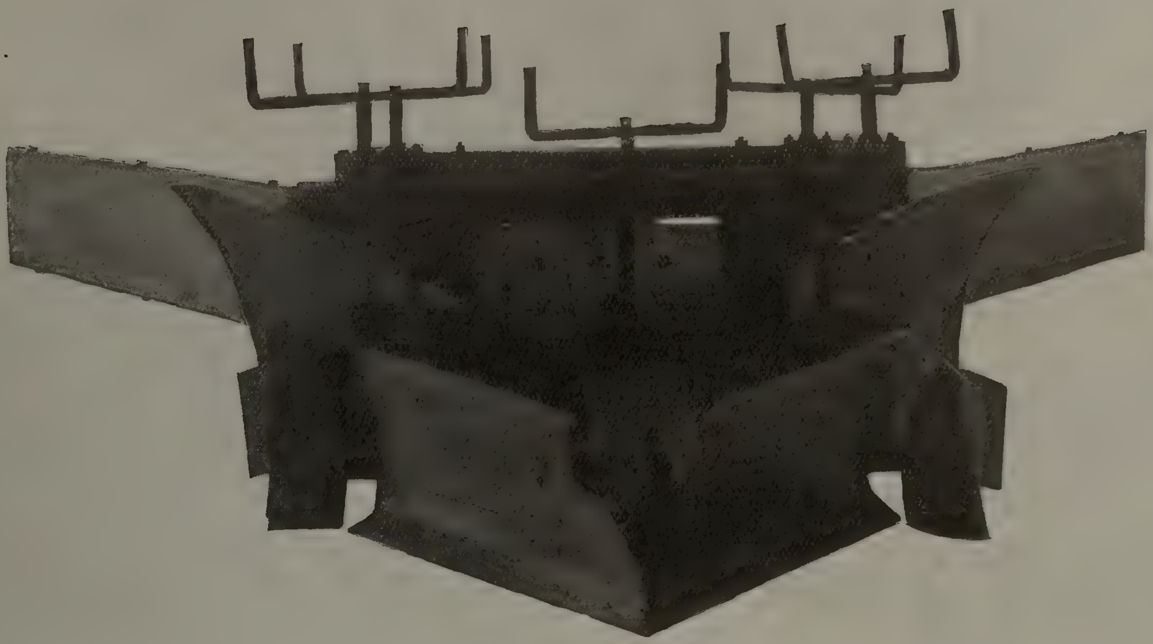
SNOW PLOWS



A careful examination of the above illustration will demonstrate to you what a complete and practical snow plow this is.

Important Points

Rutter attachment for cutting into the ice to make track for the sleigh.

Nose Piece is cast with steel points and may be raised and lowered by screws shown in illustration.

Wings of hardwood on back may be set to shove the snow back 7 feet on each side of the road.

Weight about 1,800 pounds.

We have sold over 75 of these Snow Plows

Send us your enquiries.

MOWRY & SONS **Gravenhurst**

No. 184 Four-Side Molder.

Notice the extension of the base, forming an outside bearing for the upper head and eliminating overhang of the lower head.

Molder-Value is Measured by the Quality and Quantity of Output

The best results can only be attained by using the best Molder the Market affords—a Molder that is as near perfect as human ingenuity can make it—a Molder that has stood the test.

We have been building Molders for eighty years—you have the reputation and guarantee of the world's largest manufacturers of high duty woodworking machinery back of the assertion that the latest models of Fay & Egan Molders are in advance of any other make now on the market. You also have the verdict of the most discriminating buyers, such as the Otis Elevator Co., Pullman Co., Illinois Central Ry., Sante Fe System, International Harvester Co. and many others, who have bought and still continue to buy our Molders in preference over all others.

LASTLY—our Molder catalog goes into the details of our complete line of high duty Molders—showing that our machines have all the points claimed by other manufacturers, many features exclusive in our machine and that built-in quality that is absolutely necessary in making a good Molder. This catalog gladly mailed free of charge upon receipt of your request.

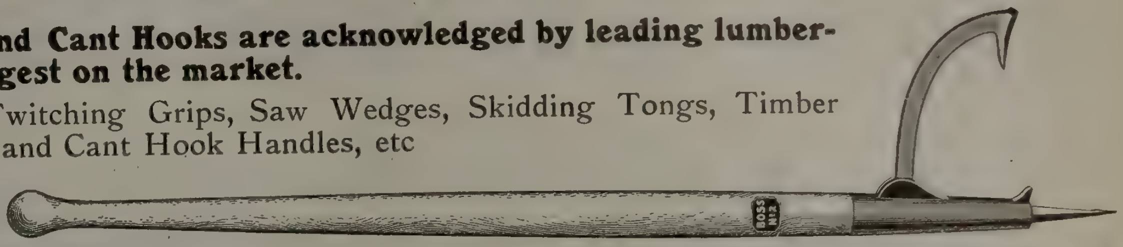
Boss Line Lumbering Tools

Manufactured by

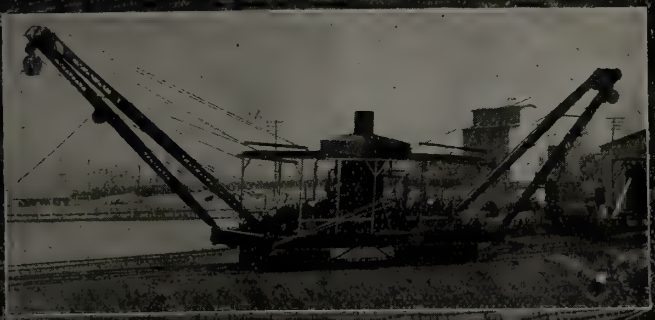
The McFarlane-Neill Mfg. Co., Ltd., St. Mary's, N. B

Forged Steel Socket Peaveys and Cant Hooks are acknowledged by leading lumbermen to be the lightest and strongest on the market.

Try our Steel Loading Blocks, Twitching Grips, Saw Wedges, Skidding Tongs, Timber Carriers, Split Rock Maple Peavey and Cant Hook Handles, etc



Catalogues furnished and prices quoted on application



Its High Daily Average, its ability to always keep a surplus of logs skidded ahead for the leading crew is what places the

CLYDE SELF-PROPELLING STEAM SKIDDER

in a class by itself. Its absolute independence of the loader prevents any interference with its fullest skidding capacity at all times and its self propelling feature saves in both moving and skidding besides the expense of switching.

Order Your GANG SAWS Early

This is the time of year when mill men begin their repair work for the coming season. Better order your Gang Saws right away and order them from us because

We specialize in the Manufacture of GANG SAWS

The **Steel** that is used in our GANG SAWS is manufactured especially for these Saws on account of its **Toughness, Durability** and the length of time it keeps its **Keen Cutting Edge.**

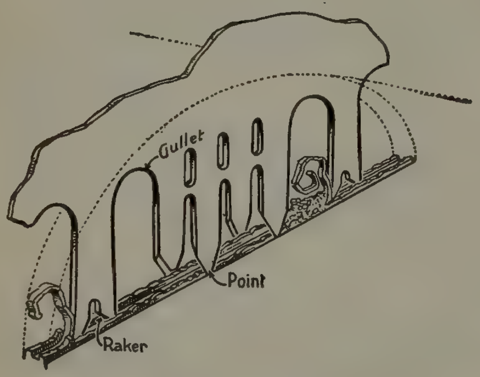
By using our GANG SAWS you will NEVER have any trouble with the corners of the teeth breaking off when swaying.

The above qualities are the most essential points in GANG SAWS.

Before placing your orders write us for further information and prices.

We manufacture all kinds of Saws, and solicit your enquiries.

R. H. Smith Company Limited
St. Catharines, Ont.



Why Atkins Sterling Saws Run Free and Easy

Saws that depend on "set" for clearance have to tear their way through the timber, like the picture to the left. The teeth are sprawled out on either side and chatter and stick and bind and tear. That's why wood sawing is sometimes considered such hard work. That's why commonly ground saws can NOT run fast or pull easy.

ATKINS SEGMENT-GROUND CROSS-CUT SAW BLADES are ground thinnest on the center of the back. The teeth are the widest part, and the blade drops easily into the smooth cut which is made by the saw teeth. Very little set makes the teeth cut clean and the rakers clear the center. See the picture to the right. These Saws merely require enough power to pull them back and forth. That's why they run so easily.

ATKINS STERLING CROSS-CUT SAWS are the only Saws that are Segment-Ground, and for this reason are guaranteed to run easier and cut faster than any other Saws. Write us for free information, or order through your jobber or dealer. If they won't supply you, let us know.

Isn't it Better to Investigate

"The HOWARD" Vulcanizing Process

than to wish you had

Positively the quickest and most economical system known for drying and Preserving Lumber, Railroad Ties, etc.

POINTS IN ITS FAVOR:

Does away with all kilns
Improves quality of all lumber
Increases the crushing strength
Increases the transverse strength
Reduces the weight 30 per cent to 45 per cent
It materially prolongs the life of wood
Eliminates shrinking, swelling and warping
Emphasizes and beautifies natural grain of the wood
Makes fit for commercial use woods not otherwise merchantable
Does away with necessity of maintaining heavy stock of lumber in yards
By this process green lumber taken from the log can be used for building purposes in 2 or 3 days

We invite Lumbermen and Owners of Woodworking establishments to see a practical demonstration of the process at our plant in Toronto

4-SAW LATH BOLTER

Lath Bolter

4-Saws

Here are a few of the important features:

The frame of this machine is made solid in one piece and all bearings for mandrel and feed roll shafts are cast solid in frame, with the exception of the mandrel bearing outside of saws, which is removable for taking out saws. This bridge, when in place, is held securely in alignment on planed surfaces by large cap screws with wrench handles. Frame is supported by two stands with planed surfaces, and securely bolted.

The front and rear pressure rollers are power driven.

The front pressure roller raises towards the saws and being power driven, prevents any pieces from flying back out of the machine.

The end bearing may be easily removed, which permits the saws being taken off the mandrel for filing. This does not disturb the mandrel.

Manufacturers of

Saw Mill, Shingle and Lath Machinery and Accessories.

Engines, Boilers and Steam Pumps, Transmission Machinery.

Full Particulars Given on Application.

Heavy Duty Lath Machine

This machine is built very strong and substantial, and will suit any mill, large or small where a large output of lath is required. The top or main frame is made in one casting, and is supported by two heavy iron stands, well braced, which makes a very rigid machine.

The bearings on either side of drive pulley are solid in frame, while the third one is so arranged as to be easily removed for the taking out of saws. This bearing, or bridge, when in place is kept in perfect alignment on planed surface, by large cap screws with wrench handles.

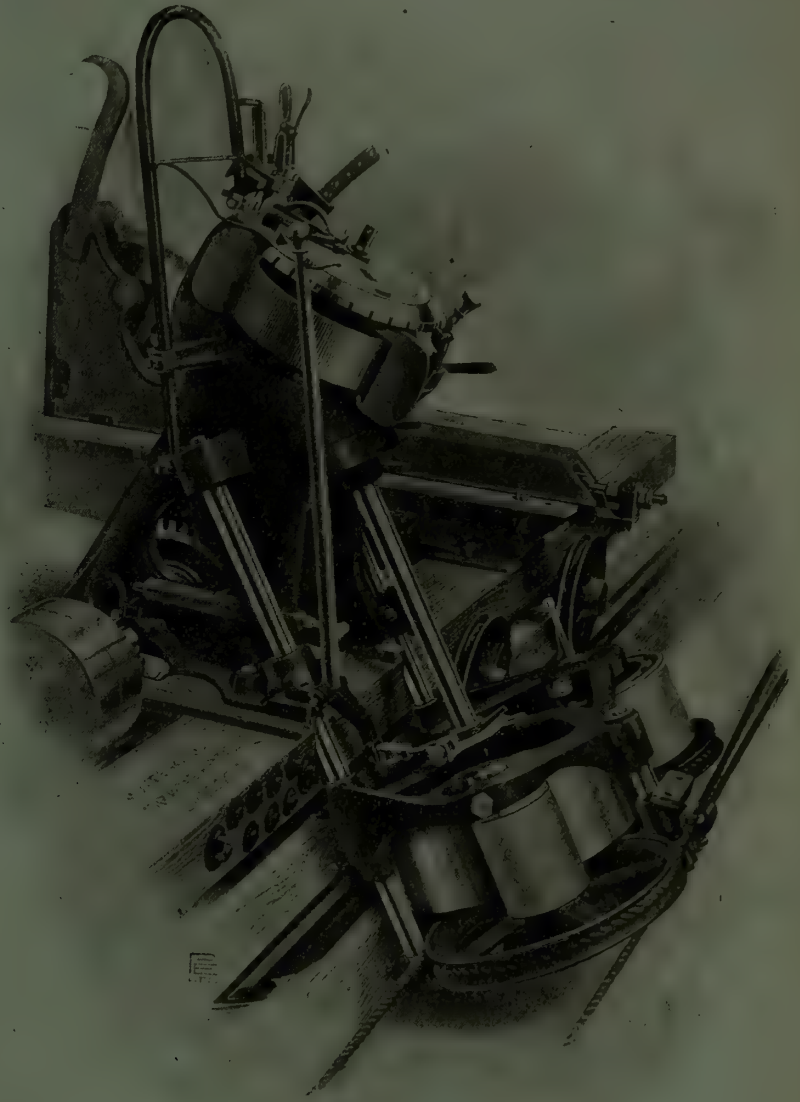
"No Heat - No Work - No Lost Motion"



THE TROUT POWER SETWORKS

Positively the Most Powerful, Accurate and Efficient Setworks Built.

The Trout Power Setworks is rope-driven. It combines a set and receding works in one machine and will turn out more lumber and better lumber than any other setworks on the market.

JUST FOR THESE REASONS:—

¶ There are only two levers to operate.

Setting is accomplished without stooping or bending.

There is no heat from the steam cylinder.

¶ There is nothing to tire the setter.

He can give his undivided attention to the sawyer's signals and cut as much lumber at the end of his shift as at the beginning.

¶ Working parts throughout are of finest selected steel.

The operation is without rack or jar, eliminating any destructive wear.

No lost motion can possibly develop.

¶ The setworks will set by 1-32 inch up to 6 inches at one manipulation of the lever.

The size of the logs does not affect the speed or the accuracy of the set.

¶ Further, the machine is entirely self contained.

It requires no change in the carriage frame.

Can be attached to any size of carriage, Rack or Screw movement.

¶ We are the sole builders of this machine. Perhaps you have seen it at work. If not the best thing to do is to visit us or to write for a fuller description than we can give here.

THE
Pembroke Lumber Co.
Pembroke, Ontario

Manufacturers of
Sawn Lumber, Lath, and Dimension Timber

Pine Doors

We have long appreciated the fact that price is not the only requisite a dealer must seek in placing his order for doors. Poorly manufactured doors can scarcely be considered a bargain at any price.

Door Making is our Specialty

We have equipped our plant with the best door machinery made, and we are turning out doors that **are right in quality and right in price.**

Our doors need no commendation. They prove themselves. They are business builders for every dealer who handles them.

If you have not received our latest quotations on Doors, Sash, and Interior Trim, write us to put you on our mailing list. It will be mutually advantageous.

440 Square Miles Timber Limits

on Georgian Bay

To be Sold by Private Sale in Large or Small Blocks.

On account of their President and Principal shareholders being engaged in other large enterprises, and not having the time to give to them all, THE PARRY SOUND LUMBER COMPANY, Limited, offer for Sale all of the timber lands, mills and town property situated in the Town of Parry Sound ; also Tug Scow and full Camp Equipment for five camps, including boom chains, snow plows, sleighs, etc.

THE LIMITS TO BE SOLD

comprise some 440 square miles of licensed and deeded Pine, Hemlock, Spruce, Birch and other timber. The licenses from the Ontario Government include all timbers and are not restricted for time. Government dues are as follows : Saw Logs, White Pine, $1.50 per M. ft., B.M. Saw Logs, Hemlock, Tamarac and other woods 75c. per M. ft. The timber is situated in the Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street. The Canadian Pacific, Canadian Northern aud Grand Trunk Railways run through the limits, which makes some of the parcels offered for sale particularly desirable for small mill owners.

A circular giving full information, maps, terms and conditions of sale will be furnished upon application to

The Parry Sound Lumber Co., Limited

Mr. Commissary Man—*It is a Fact that*

Coin Operated Machines pay Big Cash Dividends

Hundreds of men have grown wealthy solely from their earnings. Our records (and they are open to your investigation) contain the proofs. They are interesting—ask for them.

The machines can be most successfully operated in connection with a commissary. They will quickly increase its profits from 10 per cent. to 100 per cent. without adding a penny to overhead expense. The machines are handsome and fascinating. They occupy little room, require practically no attention and are one of the best trade stimulators to be had. Then too, they effectually

Solve One of the Lumberman's Hardest Problems

by enabling him to keep his men contented and amused. A few bag punchers, moving picture machines, phonographs, card machines, etc., prove an acceptable substitute for the attractions of the city. By thus rendering the camp more agreeable you will not only retain your best men but **increase your profits as well.** Our very large and varied line contains machines for every need at moderate prices. They have **paid** so well for others that they should prove a very profitable investment for you. It will cost you nothing to investigate—and it **may** mean a great deal—in dollars and cents to **you.**

My Mills Operator's Bell has earned nearly $1000.00 so far. Rush my order for the other eight Bells as time is money.
C. L. Henderson.

The Reward-Paying Punching Bag machine you shipped me June 11th arrived O.K. on the 19th. It is surely a money-making wonder.
Peter Johnson.

Disston Circular Saws

Progressive mill owners all over the world have been using Disston Saws nearly three-quarters of a century.

No saws have given such satisfaction—no saw has proven so economical.

The steady increasing demand is the best evidence of efficiency.

The name DISSTON has become synonymous with saw satisfaction, saw economy.

Seventy years of experience, perseverence and achievement has earned us the confidence of thousands.

Disston Saws require least power, stay sharp longer and give greater results.

HOLLOW BLAST GRATE
on APPROVAL.
You need not keep it
if it is unsatisfactory.
WE pay the freight.

On the market twenty years, first in its original and then in its improved forms. Over 6,000 sets in daily use.

The following is a sampe of our correspondence :

Before Using

Cleveland, O., Dec. 10th, 1907.

The Gordon Hollow Blast Grate Co.
Greenville, Mich.

Gentlemen:

I have three 300 h.p. Wickes Vertical Boilers with Dutch ovens attached to a 4-ft. chimney in use at my saw mill, burning all wet fuel, but I am not able to raise enough steam. Each grate surface is 7 ft. wide by 6 ft. long.

Will your hollow blast grate improve my condition and raise my steam?

If so, I would kindly ask that you give me your price on same.

Awaiting your reply, I remain
Very truly yours,
THEODORE KUNDTZ.

After Using

Cleveland, O., July 24th, 1909.

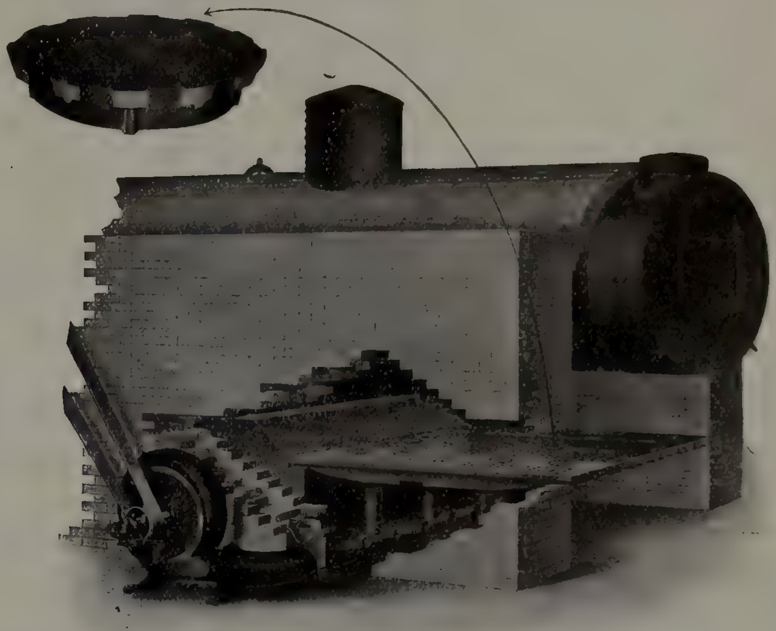
The Gordon Hollow Blast Grate Co.,
Greenville, Mich.

Gentlemen:

I had three 300 h.p. boilers in use at my saw mill, burning mostly wet fuel, and WAS NOT ABLE TO RAISE STEAM ENOUGH TO KEEP RUNNING.

Since installing your hollow blast grate I have been using only TWO of the boilers and have STEAM TO SPARE and I would recommend your grate to anyone using WET FUEL or NOT HAVING CHIMNEY DRAFT.

Very truly yours,
THEODORE KUNDTZ.



The Gordon Hollow Blast Grate can be used in plain furnaces or Dutch ovens, and with any number of boilers, from one up. Calls for no change in construction. Easy to install and operate. Saves labor in firing. Is kept comparatively cold by the current of air within, which makes it practically indestructable. Does not throw sparks. Can be fired on without running the blower, if desired. This is often necessary at night.

In writing for prices state how many boilers you have and whether you have ordinary furnaces or Dutch ovens, and give width and length of grate surface or surfaces

Gordon Hollow Blast Grate Co., - Greenville, Michigan

LOGGING LOCOMOTIVES

Six Coupled, Double End, Tank Locomotive for use in logging districts where construction of permanent roadbed is uneconomical.

This type of locomotive is suitable for roads with

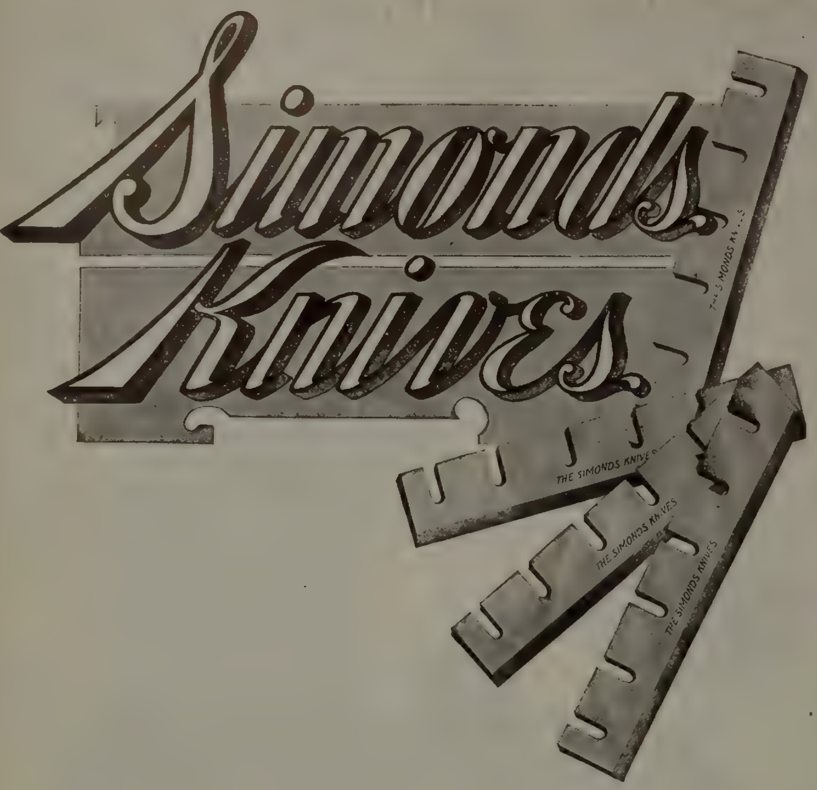
Steep Grades
Sharp Curves
Light Rails

It has a large hauling capacity, combined with light weight per wheel on the rail.

The wheel arrangement, with radial trucks at front and rear, gives good guiding qualities for running in either direction.

MONTREAL LOCOMOTIVE WORKS, LIMITED

BANK OF OTTAWA BUILDING, MONTREAL, CANADA



We have been making Knives seventy-eight years, long enough for us to be sufficiently sure of the Knives we make, to give an unqualified guarantee of satisfaction with them.

The steel used in Simonds Canada Saw Co., Limited, Knives is our special crucible steel, made in the Simonds Steel Mill especially for Simonds Saws and Knives.

Thus you will see we start right, and thereafter the steel is handled most skillfully until the finished knife is produced.

Whether you want planer, Veneer, Stave, Shingle, Moulder or any other woodworking machinery knives, you may go as far as you like, try as many makes as you like, you cannot improve on Simonds Knives. Of course, different conditions require different knives, a difference in the temper most likely. Given an idea of the kind of woods to be cut, the machine on which the knives are to be used, and the dimension, we guarantee to give you Simonds Knives that will be perfect in balance and temper, exactly right to do the greatest amount of smooth cutting with the least amount of wear and care.

When you buy Knives, always buy Simonds

Simonds Canada Saw Co., Limited

Canada, United States and Great Britain, $2.00 per year in advance; other foreign countries embraced in the General Postal Union, $3.00.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 31 Toronto, March 1, 1911 No. 5

The U. S. Trade on Reciprocity

With very few exceptions members of the lumber trade in the United States have taken serious objection to the proposed reciprocity with Canada. This was naturally to be expected, as possibly the most sweeping provision of the arrangement is the proposal to allow rough lumber from Canada to enter the United States free of duty, instead of paying $1.25 per thousand feet, which is the tariff at present in force. The most interesting view expressed by the trade in the United States so far, is that which the Hardwood Manufacturers' Association embodied in a series of resolutions passed at the recent annual meeting of the Association, which was held at Cincinnati. Inasmuch as the hardwood manufacturers of the United States have little or nothing to fear in the way of competition from Canadian hardwood, the actual lumber trade situation does not effect them. Their opposition to the arrangement is based on quite a different ground from most of the other objections which have been made. They fear that the removal of the tariff on products of the soil will reduce the value of lands which they own, after they have been cut over and are on the market for settlement. This fear is expressed concisely in the following resolutions which were adopted by the association:

"Whereas, The Hardwood Manufacturers' Association of the United States, whose membership consists of individuals and firms who are interested in the manufacture of forest products produced in the southern States:

"Whereas, the major portion of the lands from which these forests are removed are more suited and valuable for agricultural purposes than for reforestation;

"Whereas, The proposed reciprocity treaty with the Dominion of Canada purposes the removal of the tariff on products of the soil, both forest and agricultural;

"Whereas, This action would be inimical to the interests of the membership of this association who are the possessors of these lands, and would retard their development by settlers, farmers and agriculturalists; therefore, be it

"Resolved, That this association is unalterably opposed to any form of reciprocity that singles out for a reduction of tariffs the products of the soil;

"Resolved, That the efforts of each member be directed to protest against the infliction of an injury to our section, so vitally interested in agricultural development and progress;

"Resolved, That the secretary of this association be, and is hereby instructed to convey copies of this resolution to the members of Congress and senators of the United States."

The "Southern Lumberman," of Nashville, Tenn., has always paid special attention to the question of tariff. A large number of its readers are interested in southern pine and as this lumber enters extensively into competition with Canadian white pine, they are closely concerned about the proposed removal of the duty from lumber entering the United States. The "Southern Lumberman" expresses itself upon the subject in part as follows:

"Even a cursory glance at the terms of the proposed treaty will show that its chief excuse for existence is an effort to redeem party pledges—that there may be something more than the Payne-Aldrich Act to which to point the finger of Republican pride in 1912. . . The balance of trade under the terms of the treaty is easily in favor of Canada. . . A summary of the total values of the principal articles (of import) affected by the proposed agreement amounts to $48,487,942. Of this $20,607,086, or 42½ per cent. of the total, is for boards, deals and planks, laths and shingles. Thus it is seen that the lumber industry has to carry the greater portion of the load. . . . By the reciprocity agreement we are given access, not to Canadian forests, but to the products of Canadian sawmills, for there is nothing in the reciprocity agreement which would prevent the Canadians continuing their regulations forbidding the export of saw logs, etc., and requiring their manufacture in Canadian mills. It is a measure, so far as the above features are concerned, directly for the benefit of Canadian saw and shingle mill operators, at the expense of those of the United States. . . The present treaty will, it seems, effect the yellow pine industry more directly than that of the other woods, as it comes into competition more keenly with Canadian lumber. It is, in fact, not without its good features for the hardwood people, as it calls for mutually reduced rates on a line of manufactured commodities which includes motor vehicles, agricultural implements and a number of other articles into the manufacture of which hardwoods enter very largely."

The "Mississippi Valley Lumberman," taking much the same view as the "Southern Lumberman," sums up the situation as follows: "It may not be altogether accurate to attribute the continued depression in the lumber industry, so far as values are concerned, entirely to the reduction of the duty by the tariff bill now in force, but we do believe that this reduction of the duty contributed to it to a considerable extent. The fact that the importation of lumber from Canada has increased substantially since the present act became effective and in spite of the fact that the lumber business has been very unsatisfactory during the past two years, would indicate that the reduction in duty was influential to a considerable extent in keeping lumber prices at a point where manufacturers have made little or no profit. Only within the past few months has there been an improvement in the market for low grade material. To remove the remainder of the duty on lumber threatens our markets for all classes of wood and particularly for the low grade stock."

Edward Hines, the well known lumberman of Chicago, in his evidence before the Ways and Means Committee of the House of Representatives at Washington, said: "Under reciprocity the American Lumber Industry would give up protection on $23,000,000 Canadian exports in order to get a market for $4,000,000 of exports to Canada. The pending bill," he said, "makes the lumber industry bear by far the largest portion of the reciprocity burden. Lumber imports have increased under the Payne law, which reduced the tariff 37½ per cent., and the lumber duty is not protective, but for revenue."

The "Lumber Trade Journal," of New Orleans, in the course of an argument against the agreement, says: "The removal of the present duty of $1.25 per thousand, freight rates remaining the same, will give the Canadian mills an advantage practically equal to a reduction of three cents per hundred pounds, and enable them to push their market a corresponding distance south. The proposed abolition of export duties on logs, of course, would furnish to the southern mill men no relief, but, on the contrary, it would further aggravate the situation by strengthening the competition of the northern United States mills."

The paper trade of the United States has, perhaps, as little reason to be pleased with the proposed arrangement as any other industrial section of the country. They find that they cannot secure supplies of raw material from Crown lands in the principal pulpwood producing provinces of Canada, and that their government, realizing this to be the case, has included in the proposed arrangement a provision for the free entry of news print paper, as a bait to the Canadian provinces to induce them to part with their pulpwood. The paper trade is therefore to be hit which ever way the matter results. The "Paper Trade Journal," of New York, in an editorial upon the subject, concludes with the following: "There is no gainsaying the fact that this is a serious business to the paper manufacturers of this country, and while there is yet time, no effort should be spared to rectify the injustice of the arrangement. With all the friendly feeling possible to our good neighbors, we cannot see why we should be either asked or forced to hand over to them a ready made market which is ours by birthright, and why an industry which has been built up after many years of unceasing enterprise and enormous expenditure of capital, should be presented as a gift to pay a political debt of gratitude."

The gist of practically all the criticism which appears in the United States lumber papers is, that in return for the sacrifice which the lumber trade of that country may be called upon to make, nothing is given by way of compensation. The reason for this is that there is practically nothing left for Canada to give to the United States lumber trade. Already, for many years, we have admitted their rough lumber into this country free of duty, and were we to give anything further it would have to be free access to our stumpage without any proviso that it should be manufactured in Canada. If this were done the timber resources of Canada would be doomed to rapid extinction. President Taft and others who have been active in the promotion of the reciprocity arrangement on the other side of the line, have not hesitated to state that one important object of the move is to give the people of the United States access to Canadian forests, so as to aid in the conservation of their own timber resources. This is a matter which Canadians cannot watch too jealously. If the agreement is definitely enacted into law, Canadian lumbermen will owe it to themselves and to the country to take the utmost care that they do not kill the goose that lays the golden egg. Conservative methods of production will be more urgent than ever. An effort to manufacture and sell enough lumber to meet the extra demand which is to be expected from the United States would neutralize any advantage resulting from the removal of the duty. It is probable, however, that lumber manufacturers in Canada will know their own interests better than any one else; that they will be content to accept whatever improvement results in the market for low grades, if the reciprocity agreement is passed, and that they will not endanger their entire market by overproduction.

The New York Lumberman's Review is one of the few lumber trade papers in the United States which comes out decidedly in favor of the reciprocity arrangements.

"The purpose of this bill," it says, "is to be commended; . . . there is nothing in the new schedule applying on lumber which should or will cause apprehension in lumber circles. The reduction in the various duties upon lumber will have no material effect upon the industry and perhaps will result in little shrinkage as a revenue producer. From the Pacific Coast there will doubtless come more or less objection to that feature of the bill which reduces the duty on shingles, restoring the old Dingley rate of 30 cents. The advance from 30 cents to 50 cents in the Payne-Aldrich bill came as a result of very persistent work by the Pacific coast manufacturers. It was never demanded or desired on the eastern side of the continent on either side of the line. . . . Eastern white cedar shingles are produced chiefly in Maine, Quebec and New Brunswick. Most of the extras and clears are sold in New England. There is a limited market in Canada and practically no market in the United States, outside of New England. Maine, as a rule, produces 25 per cent. of the number of white cedar shingles required in New England, the remaining 75 per cent. coming from the two Canadian provinces noted above. The Canadian mills find an adequate home outlet for the grades below clears. It should be noted that when a tariff of 50 cents is placed upon shingles and $1.25 upon rough lumber, the percentage of tribute from every carload of shingles is all out of proportion to that exacted from lumber. Under the tariff of $1.25 on rough lumber, a carload would pay $18 to $20 duty, while a carload of shingles, running from 150,000 to 200,000 in a car, will pay $80 to $100 duty. Such a handicap is neither protective nor is it a producer of revenue. It is simply prohibitive, as it applies to the shipper on the other side of the line. When we stop to consider that New England wants and must have these white cedar shingles, coupled with the fact that, since the tariff was increased from 30 to 50 cents, the selling price has gone steadily downward from $4.10 to $3.10, though at present, happily, it is again gaining with some of the standard brands, bringing as high as $3.60; most of the mills on the other side of the line stopped cutting shingles, for they could not market the high grades. It is well to consider, also, the fact that very much of the capital invested in shingle manufacture over the line is American capital seeking a product for its American trade. There is much to commend and little to condemn in the reciprocity bill now before Congress."

Western Retailers Furnish Encouraging Example to the Trade

The twentieth annual convention of the Western Retail Lumbermen's Association, which has just been concluded at Winnipeg, showed that organization to be in a flourishing and vigorous condition. The retailers of the prairie provinces have long ago realized the benefits which are to be secured from co-operation of this nature and have, in their success, provided an example worthy of emulation in other parts of Canada. Having simplified many of their most difficult problems, they devoted their efforts to a consideration of such subjects as insurance, trade ethics, freight rate troubles, and the hundred and one other features of the retail trade which present daily obstacles to the individual retailer, but which, when dealt with by a representative organization, can be handled with reasonable expectation of success. In the matter of insurance alone they have met with the greatest possible success. They have reduced the cost of insurance, by their mutual insurance association, to such an extent that every retailer is now able to carry sufficient insurance to make him practically independent of the anxiety which formerly attached to the fire problem. In other parts of Canada, fortunately, advantage may be taken of lumber specializing companies which also provide insurance on a mutual plan at much lower rates than those charged by the old line companies. The western retailers, however, by establishing an insurance company of their own, have greatly increased the attractiveness of membership in their association.

The association movement is spreading among the retail lumbermen of Canada, and it is not an impossibility that in the near future there will be associations in practically every province. With this accomplished, the time will be near, when it will be worth while to consider the amalgamation of these associations into a Dominion association.

Already an active retailers' association has been formed in Ontario, which is growing rapidly and has taken vigorous steps to bring about a general improvement in the relations existing among the retailers themselves and among the retailers, the wholesalers and the manufacturers of lumber. It is possibly in this latter direction that the formation of a retailers' association can be of most benefit. At present, in practically every part of Canada, the three branches of the trade and industry are working very much at cross purposes. There is an astonishing lack of co-operation and a much more astonishing distrust of the other branches of the trade. This sort of thing should be stopped as soon as possible, not only for the benefit of the trade but also for the benefit of the consumer who invariably suffers when manufacturers, wholesalers and retailers are unable to act harmoniously. Proof of the importance of this point is afforded every time the subject of trade relations is brought up in a conversation among lumbermen.

The chaos which prevails in the grading of lumber in the different provinces of Canada and even among the different mills in a given district, is the cause of great loss to the trade, which many old lumbermen believe could be prevented. The retailer is the logical man to inaugurate a movement for the remedy of this situation. If he demands a uniformity in grading, the mills will have to provide it. There are great difficulties in the way of such a revolution, but they have been tackled in other fields and it seems reasonable to believe that they could be overcome. One of the greatest difficulties would be the continual deterioration in the class of lumber which is available, and which would render revision of the grades necessary. Periodical meetings for this purpose, however, would probably go a long way to remove the difficulty.

The success of the Western Retail Lumbermen's Association leads one to believe that a great deal more could be accomplished than has been in the past, if similar live associations were in existence in other parts of the country. The Ontario Association will probably in the near future be as progressive and as successful as the Western. Other associations are now being projected in Eastern Canada. The example of these two associations will be an encouragement to the spread of the movement which it is to be hoped will not stop until something in the form of a general association for the whole of Canada has come into existence.

Misrepresentation of Canada's Tariff Attitude

The persistence with which some of the trade papers of the United States continue to misrepresent Canada's position in regard to the pulpwood question, suggests a little more than ignorance. One of the worst offenders is "The Paper Mill," of New York, which has published several articles of late about what it terms "Canada's Vaulting Ambition." Because the people of Ontario and Quebec have come to fear that the continued use of their pulpwood for the production of paper in the mills of the United States, would soon lead to the exhaustion of the supply of pulpwood in Canada, and have taken measures to prevent the export of the raw material from Crown Lands, "The Paper Mill" periodically takes a fling at them, in the expectation, apparently, that continued nagging will induce them to revert to the old order. Canadians are ridiculed as "ignorant provincials inflated with a firm belief in their own importance and nursing a fantastic notion that they can force the paper manufacturing industry of the United States to close its mills and establish new ones in this country."

Language of this nature in an editorial or in argument, generally indicates something wrong with the argument. In the present case "The Paper Mill" has no excuse for such ill-natured criticism as it publishes in its latest issue, which is a sample of much which has gone before. Canadians have no ill-will against the paper manufacturers of the United States, but they have a reasonable ambition to see developed in this country, a paper manufacturing industry such as the natural resources of the country and the ready markets justify them in expecting. If the people of the United States have used up much of their raw material for the manufacture of paper and are anxious about future supplies it is their own concern. If they have still plenty of raw material, well and good, and they should not be so concerned about the situation in Canada. "The Paper Mill" is doing its best to create ill-will towards Canada among the paper manufacturers of the United States and to exasperate the people of Canada into a frame of mind which they imagine will lead them to take down the barriers against the export of pulpwood. They had much better go about the matter in a more neighborly manner.

Whether Canadian resources are necessary to the mills of the United States is not of much concern on this side of the line. The question is whether by retaining possession of our raw materials we can build up a prosperous paper-making industry in Canada. Those who ought to know something about the situation have no doubt that this can be done. In fact, it is in course of accomplishment to-day. Time alone will show what truth there is in the reports that the pulpwood resources of the United States are nearing exhaustion, and possibly also, in the course of time, the excited authors of these uncalled-for attacks upon Canadian enterprise will come to their senses.

Remarkable Report upon U. S. Timber Ownership

The somewhat startling report presented by Herbert Knox Smith to the United States Senate upon timber ownership in the United States, which is published elsewhere in this issue, has been long and anxiously awaited, by the lumber trade. Frequent predictions have been made that this report, when it was presented, would show that there was little or no foundation for the reports that a lumber trust existed. The report as presented does not really take up the question of the regulation of prices but is confined to a consideration of the ownership of timber lands. It is stated in the letter accompanying the report, however, that a discussion of combinations in the manufacture and sale of lumber will be included in part two, which is to be presented later. The curiosity of the lumber trade will therefore be unappeased for a further indefinite period.

That the first section of the report should have been presented alone at this particular time is looked upon in some quarters as having a political significance, the belief being that the object of the President in having the report made public, is to appease the farmers of the west, who are inclined to rebel at the proposed reciprocity treaty with Canada. If it can be shown that, by providing free trade in lumber, an alleged lumber trust is to be given a death blow, the opponents of the Taft administration believe that the President would gladly avail himself of such a course. It is said, in fact, in some quarters, that this was the exact purpose in publishing the report at this juncture.

However all this may be, it is not likely that the lumbermen of the United States were expecting anything quite so radical as the section of the report which has been presented. It goes exhaustively into a consideration of the ownership of timber and shows that a vast proportion of the timber of the country is privately owned, and that of this timber, three companies: the Southern Pacific Company, the Weyerhaeuser Timber Company, and the Northern Pacific Railway Company together own 238,000,000,000 feet, or nearly 11 per cent. of all privately-owned timber. The gist of the whole report is contained in the following sentence: "such concentration in standing timber, if permitted to continue and increase, makes probable a final central control of the whole lumber industry. A few strong interests, ultimately holding the bulk of the timber, can set the price of timber and its products."

The net result of the investigation has apparently been a conclusion that, in the past, the public land policy of the country has not been in the public interest, a fact which has been pretty well acknowledged in many respects. As to the existence of a timber trust, there is only the merest hint, and it is to be supposed that the government will in future place any blame for existing evils in the lumber business, where they actually belong. A trust, according to history, has usually been a concentration of interests in any one industry, which has been able to produce enormous profits for its members at the expense of the public. Of late years a few of the leading lumbermen have made a profit out of their operations, but the majority have been struggling against heavy loans from the banks and many of them would gladly have changed places with some of the public whom it was supposed they were milking through their alleged trust.

Canadian lumbermen, although not so seriously menaced by public ignorance of their financial operations, have from time to time been asked to offer themselves up as a sacrifice to the trust hunters. They have suffered considerably in the matter of the tariff upon lumber, and it is to be presumed that the trust cry has had something to do with the refusal of the governments of the country to impose a protective duty upon lumber from the United States. If the present tariff arrangement goes through, however, they will have compensation for this, in the shape of a free market in the United States. The whole situation is both interesting and complicated.

Consumption of Cross-Ties in Canada

Valuable Report upon Production and Use During 1909 – Slight Increase in Purchases by Steam and Electric Railways—By H. R. McMillan, M. F.

The data upon which this report is based were furnished by the steam and electric railways of Canada. The value given for the ties is the cost at the point of purchase.

There were 14,178,241 cross-ties, costing $5,210,490, purchased in 1909 by the steam and electric roads of Canada. This was an increase of 199,825, 1.4 per cent., over the purchases recorded for 1908. Owing to a decrease of one cent in the average price paid per tie, $71,195 more was paid for the ties used in 1908 than for those used in 1909.

More woods are reported as used in 1909 than in 1908. This is partly explained by a lack of care in reporting the minor species in 1908 and partly by the growing scarcity of the woods commonly used for cross-ties in Canada and a consequent growth in the use of new or imported species.

Though not as many cedar ties were purchased in 1909 as in 1908, cedar is still the chief species used in Canada. In 1909 it furnished over one-quarter, 28.9 per cent., of the ties purchased by Canadian roads. Nearly all the cedar used is eastern cedar, only 10,500, or .2 per cent., of the cedar ties purchased were western cedar. Western cedar is too soft for satisfactory use as cross-ties.

Jackpine is the second in importance in cross-tie production; in 1909 is supplied about one-quarter, or 24.2 per cent., of the ties used in Canada. Though the figures for 1908 were only approximate, it is evident that there was a much larger proportion of jackpine used for ties in 1909 than in 1908. In 1908 jackpine (including other pines) furnished only one-tenth of the ties used, in 1909 one-quarter of the ties used were jackpine.

Tamarack occupied the same relative position as a tie producer, third, both in 1908 and 1909. There was a slight increase in 1909, when one-fifth of the ties were of tamarack as compared with 1908, when the proportion was only one-sixth. About one-quarter of the tamarack ties used, 713,261, or 25.4 per cent., were of western larch. The remainder were the eastern larch or tamarack.

Hemlock is extensively used for ties in Canada. Over one-eighth, 13.1 per cent., of the ties purchased in 1909 were hemlock.

The four species above noted, cedar, jackpine, tamarack and hemlock, furnished six-sevenths, or 86.2 per cent., of the ties used in Canada. Nearly all the remainder, 10.8 per cent. of the total, is made up of spruce and Douglas fir.

Several species, white pine, chestnut, oak, cypress, red pine and southern pine (yellow or hard pine, probably loblolly), are used to a small extent for ties. The chestnut, nearly all the oak, the cypress and the southern pine are imported. The use of oak is usually confined to switch-ties.

Average Price About Stationary.

The average price of ties in 1909 was 37 cents each, as compared with 38 cents in 1908. Of the important woods cedar cost the most, 45 cents per tie, and spruce the least, 25 cents per tie. The prices of the other important wods are tamarack, 39 cents; hemlock, 33 cents, and jackpine, 30 cents. The woods used to a smaller extent vary greatly in price—from southern pine, at 67 cents, to red pine, at 19 cents. The best value of all, without a doubt, is cypress at 36 cents.

The reports received for 1909 do not all indicate what proportion of the ties used were hewn or sawn; 52.5 per cent. of the ties used in 1908 were sawn, the remainder hewn. The data received for 1909 would indicate that about two-thirds of the ties purchased in 1909 were hewn.

Steam railways used 99.2 per cent. of the ties purchased in 1909. They used 98.3 per cent. of the ties purchased in 1908.

The electric railways depended upon cedar for nearly half their supply, next in importance was Douglas fir, furnishing one-quarter of the total, and oak was third with one-tighth. Other woods used in smaller quantities were tamarack, spruce, hemlock and white pine. The electric railways, most of them at a distance from the jackpine regions, reported the use of no jackpine, the wood which furnished one-quarter of the ties used for the steam railways. No chestnut, cypress, southern pine or red pine were used by th electric roads.

Though one-half the ties used by the electric railways were cedar, for which only 39 cents was paid, as compared with the 45 cents paid for cedar by the steam roads, the average cost of all ties bought by the electric roads was 47 cents as against an average cost of 37 cents for the steam railways. The reason of this higher average was that the electric railways bought very few ties for less than 39 cents, and paid 61 cents for oak, 58 cents for Douglas fir, and 56 cents for tamarack. A few white pine ties were bought at $1.14.

Comparisons With the United States.

There is a great difference between the conditions governing the supply of cross-ties in Canada and in the United States.

Just about eight times as many ties are used annually in the United States as in Canada; about four-fifths of them are hewn and about 95 per cent. of them are used by the steam roads.

Ties cost more in the United States than in Canada and are of better quality. The price paid for ties in the United States in 1908 was 50 cents each and in Canada was 38 cents each. But the Canadian ties were over one-half of short-lived species, hemlock, tamarack, jackpine and spruce, while 86.6 per cent. of the United States ties were of such durable woods as the oaks, southern pines, cedar, chestnut, Douglas fir and cypress. Over 48,000,000, or 42.8 per cent. of the ties used in the United States in 1908 were oak, yet, with a far larger supply of durable woods than exists in Canada, the railroads of the United States, largely educated by government demonstrations, have generally adopted the preservative treatment of ties. Over one-fifth of the ties purchased by United States railroads in 1908 were chemically treated before being laid in the track. Altogether 23,776,060 ties were so treated in one year. In the beginning of 1910 sixteen of the large railroads in the United States had erected 23 plants for the preservative treatment of their supplies of ties and other timbers. Still more railroads buy large supplies of chemically preserved ties and timbers from the 61 private corporations who make a business of supplying them.

It is necessary that some means of lengthening the life of cross-ties be soon adopted in Canada.

The supply of timber in Canada is not so large as is commonly supposed. There is a great waste of timber in the manufacture and in the use of ties. About one-eighth of the ties in all the tracks of Canada must be replaced each year because of decay. The average length of life of ties of the important woods as reported by the steam roads is: cedar, 9 years; tamarack, 8 years; hemlock, 7 years; Douglas fir, 7 years; jackpine, 6 years; spruce, 6 years. It is the experience of the railroads of Europe and of many in the United States that if cross-ties of any of the above or even less durable species are thoroughly impregnated with some preservative such as creosote, carbolineum, crude petroleum or zinc chloride, materials which prevent or delay decay in timber, a much greater length of satisfactory service is assured. At the 10th annual convention of the Maintenance of Way Association a committee reported that when ties were thoroughly treated with creosote they gave a service of 15½ to 19 years; when treated with zinc chloride they lasted 10 to 14 years and when treated with zinc-creosote they gave a life of 12 to 18 years. If protected from mechanical abrasion by tie plates the life is in some instances still longer.

Preservative Treatment Would Cause Large Saving.

The general introduction of some preservative treatment would greatly lessen the annual demand upon the forest. There are, not including yards and sidings, about 28,300 miles of railway with about 85,000,000 ties in operation or under construction in Canada. Under present conditions one-eighth of the ties, 10,625,000, must be renewed every year. Were the preservative treatment of ties general and an average life of 16 years secured, the annual renwals would only be one-half as great, one-sixteenth of the total, and there would be a saving each year of 5,300,000 ties. Supposing it were thoroughly protected from fire and under better forest management than can be expected in Canada, before many years it would take from 2,000,000 to 5,000,000 acres of our northern forest belt to produce 5,300,000 cedar, jackpine and tamarack ties annually. For this reason alone it is important that the government, by experiment and demonstration, encourage the use of timber preservatives.

There would be great economy for the railroads in the use of chemically preserved ties. Allowing that the average length of life of untreated ties of different species, as was stated above (adding to the cost 20 cents for the expense, labor and freight of placing the tie in the track) it is seen that cedar ties give 9 years service for 65 cents, tamarack 8 years for 59 cents, hemlock 7 years for 53 cents, Douglas fir 7 years for 54 cents, jackpine 6 years for 50 cents, and spruce 6 years for 45 cents.

Spruce and cedar are soft-fibred woods and when used for cross-ties are so easily cut by the creeping and pounding action of the rails that by the time they are decayed they are also worn out. Preservative treatment would enable these species to resist decay for 15 years or more, but spruce and cedar ties would only last this time under heavy service if protected from mechanical wear by tie-plates. The other common Canadian species of tie timbers, tamarck, hemlock, Douglas fir and jackpine might not require tie-plates, but even if they did, there would still be economy in giving them preservative treatment, though these woods are not so easily treated as porous woods; they can be thoroughly impregnated with creosote and furnished with suitable tie-plates for 25 to 35 cents per tie, and when treated will last 15 years or more in the track.

If 30 cents is allowed as the cost of creosoting ties and equipping them with tie-plates, so that they will last 15 years, the annual charge with an interest rate of 4 per cent. is for spruce 6.74 cents, jackpine, 7.19 cents; hemlock, 7.47 cents; Douglas fir, 7.55 cents; tamarack, 8.00 cents, and cedar, 8.54 cents. This is a saving of 2.35 cents per year on every jackpine tie, 1.85 cents on spruce, 1.45 cents on Douglas fir, 1.36 cents on hemlock, .76 cent on tamarck and .20 cent on cedar.

For every mile of track preservative treatment would bring about an annual saving in maintenance charges of $70.50 where jackpine ties are used, $55.50 on spruce ties, $43.50 on Douglas fir ties, $40.80 on hemlock ties, $21.80 on tamarck ties, and $6 on cedar ties.

This reduction in regular yearly maintenance expenses represents the earnings at 4 per cent. on $1,762.50 per mile of track where jackpine ties are used, $1,387.50 for spruce, $1,087.50 for Douglas fir, $1,020 for hemlock, $545 for tamarack, and $150 for cedar.

These figures are conservative. The economies possible to the large railroad organizations of Canada would probably enable them to bring the price of treating ties and furnishing them with tie-plates, down to less than 30 cents each. On the other hand, it is likely that well treated ties will give efficient service for more than 15 years, Mr. W. F. Sherfesee, in Bulletin 78 of the United States Forest Service, estimates that thoroughly creosoted ties will last, on the average, 17 years in the United States, where, on the whole, the climate is more conducive to decay than it is in Canada. Creosoted jackpine ties lasting 16 years would bear an annual charge of 6.86 cents; if they lasted 17 years, which might reasonably be expected, the annual charge would be 6.58 cents. Compared with the present method of using raw or untreated ties, the cost of maintaining the road would be $79.50, or $88.80 less per year if treated ties were used, giving a service of 16 or 17 years each; at 4 per cent. the capital invested in maintaining the road would be $1,987.50, or $2,220.80 less per mile than it is now.

Financial inducements such as these should commend to the leading Canadian railroads the preservative treatment of ties. No doubt the general adoption of the policy would be hastened if the government undertook to co-operate with the railroads and demonstrate that the preservative treatment of timber is true economy from all standpoints.

Inferior Species Rendered Available

Preservative treatment would encourage the use for ties of timber now wasted. It would give value to timber now considered almost or quite valueless. There are comparatively large areas of fire-killed timber standing in different regions in Canada. This timber is well seasoned, light and strong, and may be cheaply handled. It is checked and cannot be used for lumber. It lacks only durability to make it very suitable for cross-ties. It is so well seasoned that preservative treatment is as a rule easy and efficient. The adoption of preservative treatment would prevent the now common waste of large quantities of this material and would turn it into first class ties. It is now believed in Canada that unless fire-killed timber is taken out within one, two or three years after the fire, it is lost. So long as it is sound it will make good ties if it is given a preservative treatment. Preserved ties made of Engelmann spruce and lodgepole pine killed 50 years ago are giving satisfactory service in the western United States.

The introduction of the chemical preservation of wood would make available, for use as cross-ties, woods which cannot be used now because of their lack of durability. Such species when thoroughly treated resist decay as long as do the most durable Canadian woods. Species which are of small value now, but which would give adequate service as tie timbers, if chemically treated, are poplar, cottonwood, birch, red maple and beech. Poplar and birch especially are widely distributed throughout Canada, grow rapidly and reproduce well, commonly coming up densely over large areas after fires and lumbering operations. These timbers, among the fastest to grow and the readiest to reproduce in Canada, have a very poor market at present. To prove them available for tie timbers would be doubly beneficial; it would solve the problem of marketing them and provide for the use of the railroads, to replace the more naturally valuable species, already disappearing, a large supply of timber hitherto unappreciated.

Every means should be taken to encourage the use of inferior species of timber for cross-ties. Cedar, tamarack, Douglas fir and oak are woods of such high technical value that they are to some extent wasted when used for cross-ties. Cedar, tamarack, and oak are becoming scarce in Canada and being of slow growth, cannot be quickly replaced; the use of these timbers, together with that of Douglas fir, should be restricted to those situations in which they have no substitutes.

The wisest use of the forests of Canada will demand that the chief tie timbers of the future will be the cheap, fast-growing species, together with what dead timber can be utilized. These are the two with which, of the timbers now used, preservative treatment effects the greatest economies, jackpine and spruce, and the others, poplar and birch, which can be used only after preservative treatment.

Sensational Report upon U. S. Timber

Bureau of Investigation After Four Years of Inquiry Presents Statement that Existing Conditions Render Probable a Final Central Control of the Whole Industry

The long awaited report of the Bureau of Investigation which was appointed four years ago by the Senate of the United States to investigate the lumber industry of that country, with a view to determine what foundation there was for the oft-repeated reports of the existence of a lumber trust, has at last been presented by Herbert Knox Smith, Commissioner of Corporations. The report is not as yet complete. The section which has been presented deals with conditions existing so far as they are concerned with the ownership of timber. The balance of the report, which will be presented later, will deal with the manufacture and sale of lumber.

The section of the report which has been presented is a lengthy document in itself, and is accompanied by a letter of submittal which gives a concise summary of the main points of the report. The letter is as follows:

I have the honor to submit herewith Part I of a report on the lumber industry of the United States. This part deals with the amount and ownership of standing timber. It does not treat of combinatioins in the manufacture or sale of lumber (as distinguished from ownership of standing timber), a discussion which is reserved for a further part.

The foremost facts shown are:

(1) The concentration of a dominating control of our standing timber in a comparatively few enormous holdings, steadily tending toward a central control of the lumber industry.

(2) Vast speculative purchase and holding of timber land far in advance of any use thereof.

(3) An enormous increase in the value of this diminishing natural resource, with great profits to its owners. This value, by the very nature of standing timber, the holder neither created nor substantially enhances.

These are the underlying facts of tremendous significance to the public welfare. They are primarily the results of our public land policy, long continued. The laws that represent that policy are still largely operative. The past history and present status of our standing timber drive home upon us the imperative necessity of revising our public policy for the future management of all our remaining natural resources. That history is here outlined.

From Government to Private Ownership

Only forty years ago at least three-fourths of the timber now standing was (it is estimated) publicly owned. Now about four-fifths of it is privately owned. The great bulk of it passed from government to private hands through (a) enormous railroad, canal and wagon road grants by the federal government; (b) direct government sales in unlimited quantities at $1.25 an acre; (c) certain public land laws, great tracts being assembled in spite of the legal requirements for small holdings. Such laws were wholly inappropriate to forest regions; but, though vigorously condemned in several public reports, they are still largely in force. In theory, they were intended to distribute the public lands in small tracts as homes for freeholders. In fact, they actually furthered timber concentration in vast holdings. The 1,802 largest holders of timber now own 88,579,000 acres of land, as compared with a vastly wider distribution of public lands in non-timbered agricultural sections.

During this interval, and chiefly in the latter half thereof, the value of standing timber has increased ten-fold, twenty-fold and even fifty-fold, according to local conditions. The present annual growth is only about one-third of the present annual cut. Replacement by new growth is very slow.

Examples of the increase during this interval are: From 5 to $30 an acre, $7 to $40, $20 to $150, $1 to $13, $4 to $140, $1 to $50. Specific tracts have been sold first for $24,000, and later for $153,000; $10,000, and later $124,000; $240,000, and later $2,500,000; $23,000, and later $500,000; $19,000, and later $1,125,000. These examples illustrate the remarkable profit made by certain individual holders.

What did the government get for the timber? Of the southern pine sold for $1.25 an acre, much is now worth $60 an acre. Large amounts of Douglas fir in western Washington and Oregon, which the government gave away, or sold at $2.50 an acre, now range from $100 to $200 an acre. The great redwood belt in California was alienated on similar terms, and some of it is now worth hundreds of dollars an acre. Practically none of the great forests in the public land states was sold by the government for more than $2.50 an acre. The great increase of value gives grave importance to the concentration of ownership.

The former chief of field service of the general land office, H. H. Schwartz, stated officially (1909) that the Timber and Stone Act:

"has resulted in the sale of over 12,000,000 acres of valuable timber lands, of which fully 10,000,000 acres were transferred to corporate or individual timber land investors by the entrymen. These lands brought to the people or general government a gross sum of $30,000,000. At the date of sale they were reasonably worth $240,000,000. The profit of over $200,000,000 went, not to the needy settler engaged in subduing the wilderness, but to the wealthy investors. Not over a fractional part of 1 per cent. of the timber purchased from the United States under this Act is held, consumed or even cut by the men and women who made the entries."

An effective illustration of what has happened under our land laws appears in the report of the United States Forester for 1910:

"An investigation emphasizes the probability that heavily timbered lands, if opened to entry, would pass into the hands of large owners of timber. Of 705,000 acres eliminated from the Olympic national forest in 1900 and 1901 on the ground that the land was chiefly valuable for agriculture and that the settlement of the country was being retarded, 523,720 acres passed ultimately into the hands of owners who are holding it purely as a timber speculation. Three companies and two individuals own over 178,000 acres, in holdings of from 15,000 to over 80,000 acres each. Of timbered homestead claims on this eliminated area, held by 100 settlers, the total area under actual cultivation is only 570 acres, an average of but 5.7 acres to each claim. It will be seen that the original purpose of the elimination was defeated, and that bona fide settlement was not materially advanced."

Control of Timber Controls Whole Industry

Whatever power over prices may arise from combinations in manufacture and distribution (as distinguished from timber owning), such power is insignificant and transitory compared to the control of the standing timber itself or a dominating part thereof. The Senate and House resolutions, to which this investigation is responsive, ask for the causes of the high prices of lumber and the effect of combination upon such prices. The resolutions, therefore, required determination of both the amount and the control of standing timber.

Amount of Standing Timber

There is now left in continental United States about 2,200,000,000,000 board feet of privately owned standing timber, of which 1,747,000,000,000 is in the "investigation area," covered in great detail by the bureau. This area includes the Pacific Northwest, the Southern pine region and the lake states, and contains 80 per cent. of all the private timber in the country. In addition there are about 539,000,000,000 feet in the national forests and about 90,000,000,000 feet on other non-private lands. Thus, the total amount of standing timber in continental United States is about 2,800,000,000,000 board feet. The present annual drain upon the supply of saw timber is about 50,000,000,000 feet. At this rate the timber now standing, without allowance for growth or decay, would last only about 55 years.

The present commercial value of the privately owned standing timber in the country, not including the value of the land, is estimated (though such an estimate must be very rough) as at least $6,000,000,000. Ultimately the consuming public will have to pay such prices for lumber as will give this timber a far greater value.

This is the first comprehensive and methodical investigation of the amount and ownership of our standing timber. It rests on the best information obtainable from records of timber owners or the knowledge of men in the industry, information which daily forms the basis of actual business dealings. (A physical canvass of the forests was out of the question.) The data, collected by field work in about 900 counties, assembled, mapped, checked and weighed in the office, are reliable within a relatively small margin of error. All figures relate to merchantable saw timber, in terms of lumber yield. The unit "board foot" is a foot square and an inch thick.

Concentration of Timber Ownership

Three vast holdings alone, the greatest in the country, those of the Southern Pacific Company, the Weyerhaeuser Timber Company, and the Northern Pacific Railway Company (including their subsidiary companies), together have 238,000,000,000 feet, or nearly 11 per cent. of all our privately owned timber. They have 14 per cent. of that in the "investigation area." With the five next largest they have over 15 per cent. of the total privately owned timber and over 19 per cent. of that within the investigation area. Finally, nearly one-half (48 per cent.) of the private timber in that area is held by only 195 great holders. The term "holder" covers any single interest—individual, corporate or group—which is so united as to be under one control.

The Pacific Northwest

Five-elevenths of the country's privately owned standing timber is in the Pacific Northwest (California, Oregon, Washington, Idaho and Montana), 1,013,000,000,000 feet. One-half of this is now owned by 37 holders; many of these are closely connected. The three largest holders (named above) alone have nearly one-quarter. This section now furnishes only one-sixth of the annual cut. Thus its timber is being largely held for the future, and the large owners there will then be the dominating influence in the industry.

The Southern Pacific Company holding is the greatest in the United States—106,000,000,000 feet. This is about 6 per cent. of the private timber in the investigation area, and 10 per cent. of that in the Pacific Northwest. It is difficult to give an adequate idea of its immensity. It stretches practically 680 miles along that railroad between Portland and Sacramento. The fastest train over this distance takes 31 hours. During all that time the traveller thereon is passing through lands a large proportion of which for 30 miles on each side belongs to the railroad, and in almost the entire strip this corporation is the dominating owner of both timber and land.

The second largest holder is the Weyerhaeuser Timber Company (including its subsidiary companies), with 96,000,000,000 feet. This does not include further very extensive timber interests of the Weyerhaeuser family and close associates.

These two holdings would supply the 46,584 sawmills in the country for four and two-thirds years. They have one-eleventh of our total private timber.

The third largest, the Northern Pacific Railway Company, has 36,000,000,000 feet.

These three holdings have enough standing timber to build an ordinary 5 or 6-room frame house for each of the 16,000,000 families in the United States in 1900. If sawed into lumber and placed in cars, their timber would load a train about 100,000 miles long.

The holdings of the two railroad companies are government grants, and 80 per cent. of the Weyerhaeuser Timber Company holding was bought from the Northern Pacific grant. Many other large holdings (here and in other regions) were mainly purchased from some land grant.

Southern Pine Region

In the southern pine region there are 634,000,000,000 feet of privately owned timber. Concentration in total timber is much less than in the Pacific Northwest. There is, however, a high concentration in the more valuable species, longleaf yellow pine and cypress. Sixty-seven holders own 39 per cent. of the longleaf yellow pine, 29 per cent. of the cypress, 19 per cent. of the shortleaf and loblolly pine, and 11 per cent. of the hardwoods.

The Lake States

In Minnesota, Wisconsin and Michigan there are 100,000,000,000 feet of privately owned timber. In Wisconsin ninety-six holders have three-fourths of all the timber. In Michigan 113 holders have 66 per cent. In Minnesota, six holders have 54 per cent. of the very valuable white and Norway pine, 16 per cent. of the other conifers and 2 per cent. of the hardwoods. Taking all three states, 215 holders have 65 per cent. of all the timber.

Effect of Concentration

Such concentration in standing timber, if permitted to continue and increase, makes probable a final central control of the whole lumber industry. A few strong interests, ultimately holding the bulk of the timber, can set the price of timber and its products. The manager of the National Lumber Manufacturers' Association recently said to lumbermen on the Pacific coast:

"The day of cheap lumber is passing and soon will be gone, but the men who make the money will be those who own timber and can hold it until the supply in other parts of the country is gone. Then they can ask and get their own price."

Certain further factors, not exactly measurable, increase still more the real concentration. First, a further interweaving of interests, corporate and personal, connects a great many holdings which the bureau has treated as separate; second, there are very large totals of timber so scattered in small tracts through larger holdings that they are substantially "blocked in" or "controlled" by the larger holders; third, the concentration is much higher in the more valuable species.

General information obtained indicates a very high concentration in timber ownership outside the investigation area.

Policy of Great Holders

The largest holders are cutting little of their timber. They thus reserve to themselves those incalculable profits which are still to accrue with the growth of the country, the diminishing of timber supply, and the further concentration and control thereof. Many of the very men who are protesting against conservatism and the national forest system because of the "tying up" of natural resources are themselves deliberately tying them up far more effectively for private gain.

The fact that mature timber is thus withheld from use is clear evidence that great additional profits are expected to accrue through further increase in value.

Land Monopoly

Standing timber is not the only question. When the timber has been cut the land remains. There has been created, therefore, not only the framework of an enormous timber monopoly, but also an equally sinister land concentration in extensive sections. This involves also a great wealth of minerals. The Southern Pacific has 4,318,000 acres in northern California and western Oregon, and, with the Union Pacific, which controls it, millions of acres elsewhere. (The government, however, is now suing to annul title to the Southern Pacific lands in Oregon for non-compliance with the terms of the original grants.) The Northern Pacific owns 3,017,000 acres of timber land and millions more of non-timbered land. The Weyerhaeuser Timber Company owns 1,945,000 acres. In Florida five holders have 4,600,000 acres, and the 187 largest timber holders have over 15,800,000 acres, nearly one-half the land area of the state. In the whole investigation area the 1,802 largest holders of timber have, together, 88,579,000 acres (not including Northern Pacific and Southern Pacific lands in non-timbered regions), which would make an average holding of 49,000 acres, or seventy-seven square miles.

Finally, to timber concentration and to land concentration is added, in our most important timber section, a closely connected railroad domination. The formidable possibilities of this combination in the Pacific Northwest and elsewhere are of the gravest public importance.

The Future

These are the facts of the lumber business in its most important feature, the natural supply. The paramount consideration remains still to be stated. There are many great combinations in other industries whose formation is complete. In the lumber industry, on the other hand, the bureau finds now in the making a combination caused, fundamentally, by a long-standing public policy. The concentration already existing is sufficiently impressive. Still more impressive are the possibilities for the future. In the last forty years concentration has so proceeded that 195 holders, many interrelated, now have practically one-half of the privately owned timber in the investigation area (which contains 80 per cent. of the whole). This formidable process of concentration, in timber and in land, certainly involves grave future possibilities of impregnable monopolistic conditions, whose far-reaching consequences to society it is now difficult to anticipate fully or to overestimate.

Such are the past history, present status, and apparent future of our timber resources. The underlying cause is our public land policy, resulting in enormous loss of wealth to the public and its monopolization by a few interests. It lies before us now as a forcible object lesson for the future management of all the natural resources still remaining in the hands of the government.

Lumber Advertising—Its Recent Growth

Reasons Why the Lumber Industry has Benifited from the Extensive Employment of Publicity—Advertising vs. Simple Price Quoting

One of the most significant developments of recent years in connection with the lumber producing and selling business, has been the increased appreciation, on the part of the leading lumbermen, of the importance of advertising. Producers of lumber, in common with the important producers of other classes of commodities, have come to look upon advertising as a scientific method of assisting their salesmen to dispose of their goods at a profit. An excellent statement of the lumberman's interest in advertising was given at the recent convention of the Hardwood Manufacturers' Association of the United States, by Mr. John B. Crosby, Chicago.

I know of no producing industry, said Mr. Crosby, more amenable to advertising benefit than the lumber industry in its various distinct departments. I know of no industry which should more logically spring to advertising as its benefactor, and perhaps its saviour, than the lumber industry. I know of no industry hitherto more unanimously uninformed and therefore contemptuous of advertising than the lumber industry. I know of no other industry whose captains are keener in their discernment of advertising possibilities, when properly presented, than the lumber industry, as far as my associates and myself have acquaintance with them.

Advertising vs. Simple Price Quoting

It is my belief that this phrase embodies the whole philosophy of a question much discussed and upon which the disagreement might almost be said to mark the line between careful and exact students of successful advertising and those whose judgments on advertising are either impetuous and inexact, or whose lack of practical experience with it detracts from their authority to judge it, without always lessening the positiveness of their opinions.

I would as soon refer a bet on the proportion of nitrogen in the reclaimed soil of Louisiana to the off-hand decision of the admiral of the Swiss Royal Navy, as to entrust my case in court to the legal skill of the most accomplished carver of gravestones, or my sick child to the medical ministrations of a pre-eminently able clam-digger, as to accept as final and authoritative the judgment upon advertising methods of the man who thinks advertising "may be all right for patent medicines and breakfast foods and silk petticoats, but it is no good for my business."

I have heard that a man of recognized business success and proven business ability recently was moved to ridicule, good-humoredly, a very important lumberman, who is one of our clients, and to say, "I see you are handling lumber the same as oatmeal now."

To quote a famous line, "This was considered a good joke in thim days," but its point does not make the same dent now.

Those who hold that view should remember that, not many years ago, the manufacturers of breakfast foods and silk petticoats were saying the same thing. They naturally felt that advertising was all right for patent medicines and other things which were already being advertised, but that goods not being advertised were thereby proven, prima facie, to be inappropriate or impossible subjects for advertising. A little later the manufacturer of silk petticoats might well have said, "Advertising is undoubtedly all right for patent medicines and breakfast foods, but it is no good for my business."

It is hard to explain, but it has every appearance of a fact, that, among all classes of important business men, lumbermen have been until very lately the slowest and most reluctant to either understand or grasp the modern prescription for stability of their market.

They seemed to think that, because wood "had the world by the tail" as a building material, and for many other so-called standard uses, wood always must remain immune to both competition and substitution. They apparently relied too much upon the antique doctrine that what was and had been always must be.

But Providence, in its guardianship of imagined commercial "rights," as in other things, is interested only in the vigorous the daring, the cautiously courageous. Lumbermen had records of brilliant commercial success behind them, but don't you know that there is no more insidious malady, and none more hard to cure, than the dogmatism of established success—the blind and deaf unreasoning egotism that sits in the chair of a supposed business "cinch."

It is not much over a year ago that lumbermen, while acknowledging the solid establishment of advertising as a vital and permanent factor in commerce, had no better encouragement than a pitying smile to give to the advocate of general advertising for their business.

I believe there must be a certain sort of quiet satisfaction felt to-day by those lumbermen who first determined to make, under the pleasing disguise of a "long-shot' speculation, one of the most definite and imperishable investments known to the business world of to-day, namely, public interest, public confidence, and, therefore, public support, none of these being acknowledged as for sale, yet all of them being subject to purchase by indirection. I am convinced that this satisfaction, always felt by the successful pioneer, ere long will increase to a legitimate sense of pride, and we trust that no one will grudge us the right to modestly share this feeling with them.

Two important groups of lumber producers, those who manufacture red gum and those who manufacture cypress, are entitled to the sense of gratification (entirely aside from the material profits) always properly felt by the man who blazes a trail through a wilderness, and then sees it become a little path, and then a straggling road, with excellent chances that it may one day be an historic highway.

In advertising lumber to the general public through general media we have had no advantage from established precedents. There were no precedents in the history of advertising for the presentation of lumber to the ultimate customer. It was necessary to make our own precedents as we went along, and we have had to solve many points of a character doubly puzzling because of their importance as precedents, without the aid of any references, and solely upon comparative deductions from successful experiences in various widely differing lines of advertising.

In talking straight to my title, "Advertising vs. Simple Price Quoting," I should say that while advertising often includes price quotation, mere price quotation is not advertising as I would define it. I should no more describe the simple quotation of prices and printing of a business card as advertising than I would call the mere presence of a litigant in court a masterly legal argument.

I should almost be willing to stand on the definition of advertising as "the deliberate purchase of public confidence," which involves the paradox that it must be earned after it is secured. Confidence bought and then abused or betrayed will give ptomaine poisoning to any business. By the above definition, advertising is a short cut to the faith of the people in your goods, which otherwise could be achieved only by the individual energy and individual fidelity of three generations. It is the purchase of friendship at wholesale, and it does not disparage or vulgarize the word friendship to acknowledge that friendship is cashable, in one way or another, or else it is not friendship, for friendship must be reciprocal—it must be an exchange of benefits, whether consciously or not.

To describe advertising as the simple quotation of prices, coupled with a signature and address, is about the same as calling a deaf mute eloquent, or, to make a better simile, it is about the same as confusing hunger with the knowledge of how to get food.

When you insert a business card in a magazine, merely stating that your name is so-and-so, that you are at such-and-such a place, and that you have such-and-such a commodity for sale, you might just as well fill that advertising space with something to this effect:

"Here I am, and I want your money because I want it. I don't care much whether you want my goods or not, or whether you need them or not. I want to sell them to you. In fact, I want to sell them to you so badly that, if you want them, you will find me energetically sitting here at home, with my feet on the mantel-piece, and my derby hat in my lap upside down. Please come around and drop in your money—I certainly do want it."

Is it not better salesmanship to give the possible customer some reason why it would be of benefit to him to secure your product?

Is it not better salesmanship to make people want your goods than to try to make them buy your goods?

No one can make you buy anything unless they can show you an advantage to yourself by so doing. Why should you expect to make anyone else buy of you unless you can first make them want your product?

In the old days, manufacturers acknowledged but a single function in trade—or at most one and one-tenth functions.

They admitted that their function was to produce goods—and, in a kindly and condescending way, to lift a lordly finger now and then by way of assisting in selling the goods they made.

Those manufacturers who hung to this genteel but weather-beaten business doctrine in the course of time found themselves sick abed and wondering what was the matter with them.

The matter was (and in isolated cases, including most lumbermen —broadminded and sportsmanlike as they really are in every other direction) that they failed (and most of them still fail) to get hold of the vital and dynamic idea that the evolution of commercial practice has determined that the manufacturer who is a big enough man to master his market, instead of playing tiddley-de-wink with it, must acknowledge two responsibilities and two full-sized functions—both equally important, and both demanding the keenest action of his very best brains.

The manufacturer nowadays must make his market as well as his product.

Get that in deep—make his own market.

A volume of business formerly called wholesaling is now retail in its comparative dimensions.

The old idea of meeting the market has given way to the new idea of making a market.

Meeting the market meant, and still means, selling to those who already want or who must have a given product. The method—individual salesmanship—one at a time.

The 1911 concept of distribution is to make your own market—as big as you want it, or as small as you want it—by multiplying the people who want your goods. Once you make them want your product, your salesmanship is scarcely more a problem than a quick and economical delivery system.

That is what man-handling advertising can do for you.

Advertising means to me the gradual infusion of a blend of desire and of confidence into the system of every possible purchaser. Sometimes the method of approach to him should be careful and delicate, and sometimes rough and full of iron, but in the hands of the skilful advertising writer the one method is no less subtle than the other. Both are carefully forecasted and calculated. In countless cases the substitution of a simple word for another word, or a transposition of points, or even a trick of punctuation, will make a medium winner into a big winner. The ideas you wish to inject into your maximum possible public should have a certain haunting quality which will not be realized when it enters the reader's consciousness, but will linger there and express itself without any conscious process of his own mind—without any definite argument with himself—without any definite decision of his own to go and get action—and will yet, inevitably, sooner or later, induce action, to your profit.

The quotation of prices and the publishing of business cards is easy; anybody can do it. Advertising is a science, an art, and a profession—not a kindergarten pastime—and, considering what it confers upon its clients, it is the most underpaid of all professions. In view of the fundamental error of the basis of compensation to those who place advertising for others, the wonder is not that there are, or have been, so many abuses, but that there are not more. Most advertising agencies of the ordinary type and methods derive all their compensation from commissions received from publishers, which renders it almost a superhuman exaction that no bias whatever should be felt or shown in the selection of mediums which pay higher commissions over some other mediums which look just as well to the outsider. All advertising agencies, even those which command superior fees from those desiring superior service, derive a part of their compensation in the form of commissions. It is about the same as the attorney for the plaintiff receiving pay from the defendant in the same case.

In every advertising situation there exists a triangle of interests—the advertiser, the agent and publishers as a class. The interesting question in very such case is based upon the fact that in every such triangle there is always an alliance of two, more or less avowed. This alliance of any two of the three within the triangle may not signify abuse of the third factor, but that does not diminish the interest as to which two within the three are coupled together, the advertiser and his agent in the interest of the advertiser, or the publishers and the agent in the interest of the publishers. These allusions are not in any way a disparagement of either publishers or agents in general, and do not indicate that there are not many cases wherein all three parties within the triangle may be striving for the same object, namely, the greatest development of the success of the advertiser. There are many publishers whose vision has comprehended the wisdom of this sort of co-operation, just as there are many advertisers whose horizon is so small that their methods become exasperating and thereby increase the temptation to publishers and agents to leave the advertiser the isolated third party.

There may be some who would object to the description of advertising service as professional, but they should remember two things: First, that distorted ethics are less likely to obtain where a high conception of professional fidelity enters a case, than where there is nothing to it but bald-headed "modern business"; and, second, that so far from the words "professional service" indicating any lack of straight-cut business ability and of definite commercial sense and precise commercial practice, they indicate the merging of all these abilities, and consequent benefits to the client. The hot-air legal advocate, sucking a lemon between paragraphs of his oratory, cuts small figure these days; a big lawyer nowadays is not only a master of the technique of his own profession, but he also must have a comprehensive and masterly grasp of every angle of commercial practice—he must be a business man who is a lawyer besides—and an advertising counsellor nowadays must be first a business man, who then adds to that the mastery of a special psychologic science.

You, as hardwood manufacturers, whose annual production is approximately one-fourth of the total of all woods, and whose stumpage is approximately only one-eighth of the total stumpage remaining, have before you the problem not of how to sell your product—that is no problem—it will all be sold anyhow—but of the price you are going to get for what you have left.

Although in the past ten years hardwood prices have shown a heavy average rise, the advance has not been, in my judgment, in proportion to the advances in other things when considered in relation to the actual utilitarian value and the indispensable character of wood to humanity.

Hardwood prices, and soft wood prices, too, are still (speaking in general terms, of course) much under the cost to the consumer of available or desirable substitutes for wood.

The only excessively high prices for wood that I have any knowledge of are those which are in some places exacted by the intermediaries between yourselves, as producers, and your ultimate customers.

The amount of money you can get for your product, while you remain in business, will be determined by the extent of the demand for it. The demand upon you comes chiefly from retailers or their equivalent. The only reason they demand it of you, and the extent to which they demand it of you, is determined by the demand upon them for your product—by whom? The ultimate consumer, of course; it answers itself.

No one will deny that every dollar you ever get through the sale of your lumber is the dollar of the ultimate user, which percolates to you through any kind, or any number, of intermediaries. The consumer's money is the only money that ever buys anything. The consumer is the last man. There is no one to get behind him. He "pays the freight," and in every ultimate analysis he determines the salability and consequent market success or failure of everything that is ever sold.

It is highly proper, courteous, "good business," and in every way desirable, to convert the intermediary between the producer and the user; but the only logical motives sufficiently strong to induce an intermediary dealer to dig up and hand out a particular article is a positive insistence upon that and nothing else by this same "last man"—the ultimate user.

This is so entirely beyond debate the moment we make a careful survey of the commercial world, that it seems hardly to need assertion, yet there still are advertisers confining their energies and salesmanship upon the intermediary who, in the final classification, is a dignified and highly efficient development of a delivery boy, who, to quote a recent editorial in a prominent lumber journal, "only recently awakened to the fact that the selling of lumber is something more than loading up a customer's waggon."

You want the good will and confidence of those charged with delivery of your goods to your customers, and your logical point of contact with them is through the lumber trade press.

There is no greater value, within an essentially restricted field, than the trade paper. It is a guide and reference invaluable to those whose particular interest it avowedly serves to the exclusion of all other interests.

Your lumber papers are supporting your interests to the best of their abilities, in some cases very high abilities, and you in turn should support them.

To increase consumption advertise to the consumer, through the channels which his patronage proves to be his favorites.

To establish and sustain sincere and intelligent team-work between your distributors and yourselves, advertise in the lumber press. Tell your distributors through their own distinctive trade papers what you are doing to enhance the market from which they will derive a benefit as definite as you will.

I should define the "general medium" as a publication which is read in homes instead of in offices.

To reach the consumer, catch him at home. The trade press is read in offices. To reach the dealer's mind when he is thinking of business, address him through that channel. That is in every way appropriate and profitable—but, how very unreasonable it would be to demand of trade papers that they cover the area or exercise the functions of a totally different class of publications. It would be as unreasonable as to expect of a lumber paper that it should prove valuable as a medium for druggists' sundries or laundry machinery. Let them serve you, and make no changes unless to do them better justice by printing in them a character of advertising likely to prove yet more profitable, and thereby enable them (to their own greater credit) to show you even better returns than heretofore.

With the total lumber production increasing in ten years over 27 per cent., and the total population increase for the same period showing only about 22 per cent., proving a rising per capita use of lumber, there might seem to be a suspicion of over-production, the effect of which upon prices would sooner or later be disastrous.

But how can you call it over-production of woods, when you take into account the tremendous present volume and the immense increase in the volume of substitutes for wood in all kinds of construction and for all kinds of other purposes?

And how can you attribute to the theory of over-production of lumber the present unsatisfactory conditions in the lumber trade in general when you consider that the substitutes for wood for every imaginable use are usually bringing higher prices than the wood which they replace?

Advertising to the Consumer

Back it up intelligently and vigorously in the trade press.

Figuring back our cypress advertising appropriation to a basis of the cut, we find that for ten cents a thousand, with our present list of publications (which is by no means a complete one, nor yet as complete as it will be shortly) we are enabled to repeat a definite cypress thought twelve times each year upon over five and one-half millions of paid circulation of the highest class of buying power, which means between twenty-five and thirty million readers per year. Figured down, this means that we are talking cypress to practically six people for a solid year for each one cent of their total space-cost. Or, to put it still otherwise, for the ten cents a thousand on cypress we are "cypress-izing" one paid subscriber to the most valuable general mediums continuously for twelve months for 8⅓-tenths of one cent, and, taking account of the other four average readers of every number of every magazine, we are carrying within one year definite and ineradicable knowledge of cypress values and cypress desirability to one good live person, at a cost of a fraction over one-tenth of one cent per year.

And some people think that advertising is expensive. And that they cannot afford it. And that they would better wait until they need it worse, and therefore can afford it less, before they do it. Heaven help them—we cannot, unless they are willing.

Cost of Producing Yellow Pine Lumber

This is a question that has absorbed perhaps more attention of late than almost any other of a kindred character, says the "American Lumberman. Its consideration has even led to the conclusion in some quarters that the industry will never have done itself full justice until it shall have adopted a uniform method of bookkeeping that, for purposes of comparison, would be upon the same principle as that enjoined upon railroads by the Interstate Commerce Commission. That such a system so adopted would greatly enlighten manufacturers and serve to avert many grave errors of management can hardly be doubted. As a result of extended inquiry and discussion among millmen a wide diversity of opinion has been elicited, except as to the need in a general way of a better understanding.

It is upon the question of accounting methods that diversity occurs, with a discrimination more or less general to furnish specific data for discussion in print. Regarding this branch of the subject a few leading operators hold that any such exhibit honestly compiled would inevitably show a loss at lately prevailing prices, and that the trade, knowing this, would be in a more pliant mood, or less inclined to resist advances shown at the same time to be fully justified as a matter of simple fairness. On the contrary, individuals willing enough to find out exactly what their neighbors are doing are not equally ready to impart similar facts for the benefit of anybody else. The value of such information is, of course, modified in individual cases by diversity of physical conditions sometimes amounting to perhaps several dollars a thousand feet. This fact naturally would rob any mere consensus of a symposium of figures of any value applicable to particular cases. The whole question seems for these and perhaps other reasons finally to be reduced to, first, the almost indispensable need of self-information on the subject and the means whereby it can best and with sufficient completeness be ascertained. The effect of this sort of education would be to avert the manner with which many individuals deceive themselves by failure to take into their account of cost items that, if included, would operate to lessen profit or increase loss.

The following table, a bona fide showing per thousand board feet, is submitted here as that of a methodical and capable management of a strong, well known plant, but less on account of the figures which may or may not be representative in a general way than the enumeration of items believed by the company to be essential to a proper showing in the case of anybody operating a sawmill and owning the timber:

Cutting	$0.49	Planing	$0.68
Skidding	1.21	Selling	.23
Loading	.61	Shipping	.18
Railroad building	.90	Miscellaneous	.29
Hauling	.75	Superintending	.49
Repairing equipment	.31	Interest on plant	.49
Railroad upkeep	.15	Depreciation	.59
Sawing	1.46	Insurance	.18
Sorting	.20	Taxes	.14
Dipping	.02	Stumpage	5.00
Yarding	.79		
Drying	.51	Total	$15.67

As a further matter of fact, this mill on this basis showed not a ruinous but a very considerable loss. Had the stumpage been reckoned on the basis of its original cost and certain items, such as interest, depreciation, etc., had been omitted, the same balance sheet would have disclosed a profit, but a deceptive profit. With reference to the item of depreciation, it is conceded that it should be on an annual basis, operating to wipe out the plant as an asset with the exhaustion of the timber back of it. This seems to be amply justified by the fact that a useless sawmill is practically a worthless sawmill.

U. S. Government Starts Experimental Wood Pulp Mill

The experimental ground wood pulp mill which the United States Department of Agriculture has equipped at Wausau, Wisconsin, in cooperation with the American Pulp & Paper Association, has begun to grind. The carrying on of the tests now announced as under way was provided for by a special appropriation, placed at the disposal of the Secretary of Agriculture by Congress last winter, to conduct tests of the suitability for paper making of plants and woods which seem likely to become valuable sources of supply of new material.

Secretary Wilson considered that the best use which could be made of this money would be to conduct experiments on a commercial scale, with various kinds of wood. Some of these have already been studied in the laboratory, and found to be intrinsically suitable for pulp manufacture. The Forest Service has actually made paper by one of the chemical processes from several of them. In order to know whether they can profitably be utilized, under present conditions, it is necessary to test them under methods of manufacture comparable to those employed in actual business operations. In particular, it is desired to find out to what extent new woods can be used for ground pulp, the cost of which is usually less than that of chemical pulp.

While the experiments are intended to cover woods from all parts of the country which, from the standpoint of physical properties and available supplies, promise to furnish new material for the paper-making industry, a special point will be made of tests of western woods which are abundant in the national forests. There are enormous supplies of various softwoods in these forests for which there now exists little demand, and this fact constitutes one of the serious problems of management of the national forests. If ground pulp of the requisite quality can be made from new and abundant woods as cheaply as it is made from spruce, one of the most serious problems of the newspaper publisher nowadays will or should be considerably simplified.

A Change in Pulpwood Reciprocity Clause

The only change made in the reciprocity bill in its passage through the Ways and Means Committee of the United States House of Representatives was one clerical in its construction, but important in its result. The pulp and paper clause is removed from the reciprocal list, in the centre, and made a separate section at the end, thus having the effect of being an enactment of this country alone. "We leave Canada to deal with the entrance of pulp and paper into that country as it sees fit," said Mr. Hill, a member of the committee in explanation. To further questions, Mr. Hill replied, confirming the interpretation the American paper consumers put upon the pulp and paper clause. "Pulpwood is made free," he said, " and any product of pulpwood up to four cents a pound is from any part of Canada, if it is made from land on which there are no restrictions." This will admit free pulp and paper from wood cut on private lands, even in Ontario and Quebec, where there are restrictions prohibiting the export of pulpwood cut from Crown lands."

Lumbering operations on the Tobique river, N.B., are reported to be progressing satisfactorily. There was about two and a half feet of snow at last report, making ideal hauling. The favorable conditions for yarding will make the cut larger than was anticipated.

Rules Adopted for Wagon Oak Plank

Exporters Approve of Regulations Arranged in Conference with English Trade—Important Trade Agreement

The special committees representing the National Lumber Exporters' Association and the American Waggon Oak Plank Association, which went last fall to lumber centres in Great Britain and upon the Continent in the interest of uniform inspection and forms of contract, have completed their report and submitted it to their respective organizations. The committees visited London, Liverpool, Glasgow and Antwerp and at each point met with representatives of the lumber interests. It was only at Antwerp that they did not fully accomplish the object of their mission and this was due to the fact that in this city, and even in all of Belgium, the lumbermen have no organization, and are only affiliated with and are a part of the Board of Trade of Antwerp. At the other three cities they reached a basis of agreement.

At Liverpool the committees met with a committee from the Liverpool Timber Trade Association, and after an interesting and lengthy discussion the following rules were adopted unanimously:

Specifications for Wagon Oak Plank

Waggon oak planks shall be:

1. Sound oak sawn full to size, ends trimmed, square on edges, except that wane not to exceed 1½ inches wide in the aggregate on one face at extreme point one-third from the end of the plank, shall be admitted if not exceeding 10 per cent. of the pieces.
2. Free from grub-wormholes, rotten knots and rafting pin-holes.
3. Sizes 5 inches and up thick admit heart centres, hearts to be well boxed. Sizes under 5 inches thick to be clear from heart centres.
4. All planks must be clear from wind shakes. Ordinary surface cracks shall not be objected to.

At Glasgow the Clyde Timber Brokers' Association were the hosts to the visiting committees. The Glasgow committee approved of the provisions for the waggon oak plank rules adopted at Liverpool, and with the visitors they reached the following agreements:

1. Measurement of oak planks shall be made at square end of pieces and no allowance shall be made in measurement of waney pieces as mentioned in first paragraph, section 1.
2. In the event of any dispute arising with buyers of any description of wood goods, the matter shall be left in the hands of each timber broker in Clyde to adjust his own disputes, and in exceptional cases he shall be empowered, if he considers it advisable, to call in the services of a third party.
3. That it is advisable to accept contracts for sap gum free from stains. This, however, is only a recommendation when it can be so arranged.

Variation in Measurement

4. To define the variation in measurement reasonably accepted and allowed on a carload was found to be impracticable, as the basis of sales to buyers was made on landed measure, as ascertained by sworn neutral measures, and this matter was consequently dropped.
5. That the method by which additional evidence may be obtained in support of claims against steamship owners, shall be taken up by the Clyde Timber Brokers' Association.
6. A general discussion initiated by the Clyde timber brokers took place upon the mixing of grades, to ascertain if it could not be prevented, but as it was impossible to have this done, the matter was dropped.

These rules have now been approved in the United States.

As an indication of the extent of the waggon building business in the United Kingdom, at the present time, it may be mentioned that the Great Central Railway Company have given an order for the building of 6,500 waggons to the Metropolitan Amalgamated Railway Carriage and Waggon Company, of Saltley. The order is believed to be the largest for waggons ever given to a single company in the United Kingdom, though larger orders have been given at times in the past by foreign railway companies. It will keep the waggon building branch of the "Amalgamated's" works busy for about two years, and will make a large demand for materials.

Reducing Waste on Broken Staves

Variety is not only the spice of life, but in the cooperage business is sometimes a saving grace. At least in one respect it is a good plan to develop a business including several lines of packages, because when a cooper has an outlet for barrels of different sizes he need not worry much about the disposition of broken or defective staves.

While the proportion of staves which are intended, say, for use in whisky barrels, and which are found to be, by reason of too much sap, defects in the texture of the wood, or other reasons, unfit for use, is comparatively small, yet the number that is thrown out during the course of an active season's work is considerable. The cooper who has no method of disposing of these is probably the exception, but at the same time it may be well to point out that it is unnecessary to consign the casts-off to the boiler room or the furnace.

Usually, unless the stave is so badly broken that its length is reduced below 20 inches, it can be cut so as to be of value in packages of smaller size than that for which it had been intended. Most tight barrel plants have departments devoted to the manufacture of kegs, and they get a good part of their supply of staves from the cast-offs of the barrel department.

After being cut down, the amount of the reduction depending upon the location of the defect of the sap, the stave is put to whatever use it seems most adapted for. Half-barrels, beer kegs, well buckets—half a dozen different packages requiring staves of smaller than the standard size used for whisky barrels, are possible outlets for the stave which has fallen out of the running in the main shop.

Of course, the use of a broken stave which was bought at the full price of a sound one redeems its value to a large extent, and prevents its being a total loss, but the reduction in value is always considerable. No one is inclined to throw out a good piece of stock without good reason, simply because, by proper handling, it can be converted into use in another direction. The original cost price should be borne in mind, and an effort made to use the defective stave in such a way as to recover as large a part of this value as possible.

A leading cooper was discussing the broken stave proposition recently with the representative of the "Barrel and Box."

"Come out in the yard," he suggested. When they reached the open he led the way to a section near the keg shop, and pointed out a big pile of stock composed of staves of varying lengths and thicknesses.

"Practically all that material," he said, "is the result of staves being thrown out as unfit for use in our tight barrels of the largest size. We don't believe in throwing away good material, however, and make a point of turning everything we can into cash. So every stave that is broken or found defective is taken up carefully and is cut to as large a size as possible in view of its defects. Then it is used in the making of half-barrels, kegs, or whatever other use it seems most adapted for."

The cooper referred to did not believe that his method was particularly new or had the merit of originality, but he asserted that careful attention to this point saved him hundreds of dollars every season, that would have been lost had not the stave been converted from its original purpose to another.

The experience of another prominent tight cooper will also be of interest in this connection. He said:

"In the process of the manufacture of cooperage there is a daily percentage of broken staves, which, however, is not very large. These broken staves we accumulate, inspect them again and then cut them off to certain lengths suitable for liquor kegs and half barrels. In this way we save about 80 per cent. of such material for such purposes as stated and the balance goes into the firehole.

"We have a cut-off department where an experienced sawyer takes care of our accumulation of so-called waste, who is supposed to use his very best judgment in making merchantable cut-off staves out of the broken material. We have gauges for the several lengths of keg staves to which these broken staves are measured up. In our case, we save the straight as well as the bent staves."

Plenty of Snow in Rainy River District

The heavy snow storms this winter are very welcome to contractors and lumbermen in the Rainy River district of Ontario. Last spring was one disappointment so far as the contractor was concerned. There was not a great deal of snow in the woods during the winter, and it was such a gradual spring season that the snow disappeared without raising the rivers much. The result was that thousands of logs and ties were hung up along different streams and were not brought down to the lake where they could have been realized upon. The Pigeon River Company had a large number of their logs hung up last season in the streams. With these and the logs taken out in the swamps this winter, the company will have enough pieces, it is stated, to keep the mill humming all next summer and winter, and this will mean a lot of employment to men. There were several of the tie contractors who had practically all their contracts out on the rivers awaiting the freshets that never came. These men will await the opening up of the river with impatience. At the present time builders and the trades people are looking forward to a very busy season in the building line. Architects state that they are busier than ever before at this season of the year and they anticipate quite a building boom to commence the first thing in the spring.

Owen Sound's New Furniture Industry

The North American Furniture Company, Limited, of Owen Sound, Ont., have their new factory completed and machinery installed and will start operations in a few weeks. This concern, which will be one of the largest of its kind in Ontario, has been started by several Owen Sound business men. The main building is 386 x 60 feet, four storeys high. The latest machinery has been installed for the manufacture of high class furniture. A modern dry kiln has been built, 86 x 102, with a capacity of 250,000 feet of lumber. The officers are J. H. Kilbourn, president; A. Hayse, vice-president, and H. B. Smith, secretary-treasurer. The manager, J. A. Minchener, is a practical man of long experience in the furniture business. It is estimated that upwards of 2,000,000 feet of hardwood will be consumed during the year.

Lumbermen Protest at Washington

Prominent Representatives Testify that Reciprocity Arrangements would be an Injustice to a Great Industry—Evidence of Edward Hines and D. E. Skinner

By Our Own Correspondent

Washington, Feb. 20.—The American lumbermen had a field day before the Finance Committee of the Senate to-day, during which they made their protests against the provision in the reciprocity agreement for free admission of rough lumber into the United States. It was evident from the demeanor of the two men who spoke that they are in deadly earnest and want the country to feel that a rank injustice is being done to them. It is fair to say that the committee showed no sensations of terror at the onslaught; but they are used to such gatherings, and if the Senators possess any emotions they have learned to conceal them even in the face of a threatened or dying industry. When the lumbermen represented that the southern mills are even now working without profit, it seemed a natural question to the members of the committee, why they should continue. The reply was that it was better to keep the mills going even without any profit, in hope of bettering conditions, than close them down and incur the danger of rapid deterioration.

The first to speak for the lumbermen was Edward Hines, of Chicago, whom Senator Cullom introduced as one having "more lumber than anybody else in the world." Mr. Hines changed that to read, "We are the largest distributors of lumber in the United States." Mr. Hines gave evidence before the Ways and Means Committee of the House of Representatives, and his statement to-day, while traversing somewhat the same ground, contained considerable new material. He said that as president of the National Lumber Manufacturers' Association he had been called upon to voice in the strongest terms possible a protest from 48,000 lumber manufacturers of the United States against the provision for free lumber in the reciprocity agreement. Half of those manufacturers did not own any standing timber. Under the Payne-Aldrich tariff, lumber suffered a cut of 37½ per cent. ad valorem, being the largest cut of any of the important commodities. Under the working of that tariff law importations from Canada had increased enormously during the past year. They had risen from 836,795,000 feet to 1,043,823,000 feet in one year, and the indications were for a still larger increase this year.

Mr. Hines complained that of the total amount of imports from Canada affected by the proposed tariff agreement of $47,000,000, no less than 49.9 per cent. were lumber products, so that that industry had to bear more than its share of the burden of competition that would result. The protection Canada would have on dressed lumber would be 300 per cent. more than existed in the United States under this agreement. The Canadian lumbermen, Mr. Hines said, enjoyed a great natural advantage in proximity to the great consuming markets for American lumber, namely, the middle and western States, and this advantage amounted to about $6 to $8 per thousand.

"If your figures are correct, why is it that Canada does not shut up your southern manufacturers?" asked Senator Taliaferro.

"Canada is shipping to us at the present time her low grade of lumber," Mr. Hines replied. "She is exporting to England and to Europe her better grades, and is flooding us with the low grades and the common kinds of lumber."

"If Canada has such an advantage as you say, I do not see how the southern States can ship lumber at the present rate to New York," commented Senator Taliaferro, further.

"At the present time the southern manufacturer is marketing his lumber at actual cost," Mr. Hines replied. "Many of the concerns in the south are practically in bankruptcy. Their bonds and their indebtedness are practically eating them up at the present price of lumber. That is the condition to-day in the south."

Replying to further questions, Mr. Hines said the removal of the $1.25 duty would put the southern lumbermen in just that much worse position. At the present time the sawmills were just about getting the stumpage price. In over 75 per cent. of the cases in the south the timber that had been bought in the last eight or ten years was practically not netting the manufacturer any profit over the price he paid for it. Mr. Hines figured out that the last reduction in the lumber duty had resulted in a lessening of lumber prices of about $2 a thousand.

"Inasmuch as the reduction in the tariff was not $1 per thousand, you could not say it was the reduction in the tariff that brought it down," observed Senator McCumber.

Mr. Hines insisted that it was, and attributed it to the fact that following the reduction in duty large quantities of lumber had been dumped on the American market, resulting in a depreciation in prices.

The Canadian lumberman had several distinct advantages over the American, in Mr. Hines' opinion. In this country the lumberman bought outright at a fixed price, subject to immediate interest and taxes, while in Canada the State owned the timber and ran the risk of fire and cyclone. Besides this, the taxes were much higher here. There were, too, higher wages to pay, as in Canada the lumbermen employed Chinese, Japanese, Hindoos, etc. In face of those conditions the American lumbermen were now confronted with the prospect of free lumber.

At this point Mr. Hines challenged the statement of President Taft that the American forests were in the hands of comparatively few owners. The investigation authorized by Congress in 1906 had resulted in no report until very recently, and now it came at a time when it would be very useful in influencing public opinion to the view that there was a trust and that therefore it was desirable to remove the lumber duty, while it gave no time for the lumbermen to meet the charge. "The President is laboring under a great misapprehension in this whole proposition," said Mr. Hines.

The witness went on to argue that if the paper manufacturer were to have free raw material in the form of the removal of the restrictions on the export of pulpwood from Canada, the lumbermen ought to have the right to import logs from Canada.

"Do you think that would help these southern mills?" asked Senator Taliaferro.

"I say it would not."

"You argue in favor of it?"

"No, I do not; my position is thoroughly against this bill. I am arguing against this bill absolutely; but I say after presenting that argument—"

"You are just presenting this point to show what you think is the inconsistency?"

"Yes, the inconsistency and the discrimination against the lumberman."

David E. Skinner, of Seattle, spoke for the coast lumbermen. He presented a long telegram from banking and business interests of his city protesting that the lumber, coal, fish, fruit, shipping wheat and Alaska trade of the coast would be jeopardized by reciprocity. Taking the duty off lumber would destroy the coastwise trade, for it would fall into the hands of foreign vessels. "This seems to me," said Mr. Skinner, "the most inconsistent, the most reprehensible, the most unreasonable proposition that the American people have ever had to confront, that on the Pacific coast we are to be compelled, by the Administration or by anybody else, to live under a free trade enactment, which puts the sale of our commodities that are used in the United States in free trade competition, when the balance of the United States practically is protected. It is practically impossible for the western half of the United States to live and prosper under such conditions. We might as well go back to President Lincoln's statement and have half slave and half free."

Nova Scotia's Excellent Forest Protection Service

In the matter of freedom from forest fires, the Province of Nova Scotia has made a splendid record during the past seven years. Since the year 1903, when serious loss by fire occurred among the forests of the province, there has not been a serious forest fire in the province. This is due largely to the excellent Forest Protection Service, of the province, and partly to the awakening of public interest in the importance of fire prevention. The year 1910 was no exception to the rule, as the Forest Protection Service reports that there were throughout the year practically no fires. In the "Canada Lumberman" of February 1st there was published a reference to the forest fires of the province, which stated, in error, that the loss from fire during the year 1910 had been serious. This was an injustice to the Forest Protection Service of the province, which has been so instrumental in preventing the occurrence of fires and has in this manner been of inestimable service to the province.

The annual meeting of the New Brunswick Forest, Fish and Game Association was held at St. John, N.B., on February 15th. In addition to the election of officers, a quantity of important business was transacted, one of the chief matters decided upon being a reorganization of the association and its incorporation. The election of officers resulted as follows: President, J. Fraser Gregory; Vice-President, W. H. Thorne; Treasurer, John White. The association placed itself on record as strongly opposed to the proposition for the erection of a dam at the mouth of the Tobique river, or across the St. John river at Hawkshaw, and the executive were authorized to take any steps they considered necessary to prevent the passing of legislation with this object in view.

The Retail Dealer and His Problems

Annual Meeting of Western Retailers—Cost Publicity

Western Retailers' Annual Meeting

The 20th annual convention of the Western Retail Lumbermen's Association was held in Winnipeg on February 15th. There was a record attendance at the opening session when over 200 members answered the roll call. The chair was occupied by Mr. A. R. Godfrey, who extended a hearty welcome to the delegates. The report of the secretary, Mr. Alan M. Stewart, showed a gratifying increase in membership and a very satisfactory financial statement. At the afternoon session most of the time was occupied by the reading of a paper on "The Association Idea in Trade Relations," by Mr. G. H. Ketridge, of Evanston, Ill.

Mr. Ketridge referred to the code of ethics adopted by the American lumber and trades congress, which, it was claimed, had established a common law in connection with the lumber business which had eliminated 75 per cent. of litigations and disagreements. He had recently been appointed an arbitrator in a case which involved his wading through sixty letters, and the whole amount in dispute only totalled a little over twelve dollars. This showed the futility of squabbling among themselves, when a single reference to the code of ethics would have obviated all unpleasantness. He held that the seller should not be held responsible for delays incident to transportation beyond his control before allowing the shipment to be moved or disposed of otherwise. Mr. Ketridge then proceeded to deal with the difficulties met with in the transactions of the trade in connection with their dealings with the wholesale merchants, and argued that arbitration methods should be employed wherever possible in the settlement of all matters in dispute. The widest possible trade publicity should be given for the purpose of making known irresponsible and unscrupulous manufacturers, wholesalers and dealers. That men should be guided by a moral law is only beginning to be understood, but it is rapidly becoming a strong public sentiment and force.

Though the main theme of the address was the benefits of organization, Mr. Ketridge gave a brief resume of the retail lumberman's business from its initial stages to the present prominent position it holds in the commercial life of the community. With it he traced the growth of the association idea among the lumber interests, which had now reached the stage that a movement was on foot to spread the idea of a national association of retailers.

"In a great and growing country like this," said Mr. Ketridge, "where the development is so rapid that it can hardly be kept track of, there exists a necessity for the thorough organization and association of the several elements in the conduct of the lumber business. The interests of the three branches of the lumber trade are necessarily interrelated, and one is on an equality of necessity with the other. In no line of business has the old destructive competitive idea been so much in action as in the lumber business, and particularly in the retail branch. Individual selfishness has had its full sway ever since the second retail yard was opened."

The paper went on to show that conflicting interests led to the association idea becoming a necessity, and concluded: 'The idea has become a force in the lumber world. It has the seed of merit in it, and men are found who are willing to sacrifice their time and money and in every legitimate way to spread the gospel of its benefits. So that from being a private idea it has become a public one and has attained the force of a public sentiment."

An interesting discussion followed the reading of the paper.

Mr. G. C. Ingram addressed the convention in connection with disputes that frequently arose between retailers and railway companies. There was, he said, a great deal of time wasted by retailers in trying to have their grievances redressed without knowing the best way to go about it. They often went to the railway agent for advice, and only succeeded in being more mystified for their pains. He strongly urged that those present should take advantage of the services of their secretary, who was more experienced in adjusting such matters.

Uniformity of Manufacture.

A. R. McDiarmid, Brandon, Man., speaking on "Generalities appertaining to the manufacture of lumber," advocated uniformity in the manufacture of material, or the adoption of a universal list, which, he claimed, would remove a great deal of the perplexities which arose between the wholesaler and retailer. It could be so arranged that they could have their own rate of discount to be allowed off the published catalogue. The dealers, themselves, were often greatly to be blamed for not being explicit in stating their orders.

The following resolutions were adopted: "That the manufacturers be asked to get together and make universal moulding," and "That the portion of the paper dealing with the uniform standard regarding moulding be sent to the members of the Manufacturers' Association."

Messrs. Macdonald and Anderson, both urged that the Retailers' and Manufacturers' Associations should be more in touch with each other. Both speakers agreed that none would be better pleased than the manufacturers themselves if a uniform standing of moulding were arranged. It was decided to hold the 1912 convention in Winnipeg.

The election of officers resulted in Mr. W. W. Ireland, of Carberry, Man., being chosen president. The other officers elected were as follows: Vice-President, W. Mergens, Weyburn, Sask.; New directors: W. W. Davidson, Moose Jaw; A. J. Ross, Unity; Charles Baker, Moose Jaw; J. E. Walker, Rocanville; H. E. Meilicke, Dundern; Mr. Carpenter, Yorkton; Mr. Grist, Watrous; C. Campbell, Forget; Mr. McElhaney, Outlook. Directors for Manitoba: D. E. Sprague, Winnipeg; G. F. Robertson, Winnipeg; G. E. Davidson, Manitou; D. E. Fraser, Kenton; A. H. Shaw, Elm Creek; J. Playfair, Baldwin; E. E. Finch, Strathclair; J. K. Robson, Treherne; A. B. Estlin, Melita.

A meeting of the Retail Lumbermen's Mutual Fire Insurance Company was also held, and the following directors were re-elected for 1911: J. A. Thompson, J. B. Sinclair, R. K. Godfrey, K. H. Wall, J. P. Jansen, F. McPherson, H. E. Meilicke, A. B. Estlin, and A. W. Jones. The following officers were re-elected: J. A. Thompson, president; J. B. Sinclair, vice-president; A. K. Godfrey, treasurer; Alan M. Stewart, secretary. The following executive committee was re-elected: J. A. Thompson, J. B. Sinclair, A. K. Godfrey, G. H. Wall and F. McPherson.

Publicity of the Cost of Doing Business

One of the best addresses delivered at the recent convention of Northwestern Retailers at Minneapolis, Minn., was upon the subject of "Publicity of the Cost of Doing Business," by J. W. Barry. In the course of his address Mr. Barry gave the following suggestions for remedying some of the retailer's ills.

What does it cost you to do business? The old answer was: "None of your damn business." There were trade secrets then as to freights, stock bought in blocks, grades and other kinks—all of which are mere folk lore tales to the lumbermen of 1911. To-day wholesale prices are printed from week to week in builders' and even in farmers' journals, while freight rates are a matter of sign board record in every way station. As to grades, the manufacturers have carried their refinement to a degree unequalled even in the French code of dueling, so that even the "official" grader must carry a printed copy of the book on rules to avoid grading the same piece wrong twice. How different from the good old days when, according to eminent white pine authority, there were only two grades of yellow pine, namely, "Poor and Damn Poor." White pine grades, too, were almost as simple but like the Kentucky Colonel's whiskey, while some grades were better than others, there never was any poor white pine. The absence of old time conditions with other things that will occur to your mind, force a different answer to-day to the question: "What does it cost you to do business?"

The talk of the day is to eliminate the middleman—the retailer—while, on the contrary, the tendency of the time is to establish him more firmly than ever on enduring foundations. The motor pushing every business is "Personal Gain," and, like other motors, business motors are sometimes steered wrong into roads which, while they promise well at the beginning, yet soon taper to quicksands that "kill" the engine. Some manufacturers have joined, aided and abetted the "Talk" to eliminate the retailer, not from any love of the consumer nor yet from any hatred of the retailer or from a desire for the betterment of the community at large, but for the sole purpose of getting more for their product. Such talk seems to take on new life every time there is a lull in business. Then it is that the manufacturers cast longing eyes to the pastures of the retailers where all they can see is the "long green" lining the banks of the silver streams from which happy retailers are selling golden fish. Happy vision—but "bum steer." Here butts in the consumer—the other party to the constantly recurring talk. He finds himself ready to go to almost any lengths in joining to eliminate the retailer—not because he hates him—not because he loves the manufacturer, but solely because he wants to get the product of the manufacturer for less money. Two souls without a happy thought—another "bum steer." Between these two gentle forces, the manufacturer wanting to get more, the consumer seeking to pay less, the retailer lives and has his being. He is the distributor—wanted by neither—yet demonstrated to be economically vital to both. Neither the manufacturer nor the consumer has ever been able to make the final distribution in any line at a saving over the retailer's price. Every principle of political economy enforces the logic of the retailer's position as the final distributor of products.

Education of the Retailer

Indeed, economic conditions have combined to make the retailer much more than a mere distributor, for he is compelled to maintain an exhibition of forest products and other building material—an exhibition which is free to the public in more senses than one. Go with me to almost any yard in any of the larger towns in that great section of the country often referred to as the battleground of the woods. In going the rounds of the yard you will find practically every wood manufactured in the country. In this alley is the department of the south; here you see yellow pine, cypress, poplar, gum and oak and their products; in the next alley will be found the department of the north with northern pine, hemlock, birch, basswood, maple and their products. Over on the other side is the department of the west, with its red cedar, fir, spruce, western pine, California redwood, western white pine and gray fir and their products. Contrast this, the modern retail yard all under cover, with the few piles of but one wood piled in the open, which constituted the yard of a few years ago. Then the retailer was supplied from the jobber who shipped in cargo, and re-shipped in car-lot. But when the freight became no more when shipped direct from the mill to the retail yard—when the carload became the economic unit of final shipment, the double handling became a prohibitive charge and the jobber was so completely driven out that to-day the word jobber means to the average retailer the same as commission man or even scalper. So that now the retailer carries a greater variety than the old time jobber ever dreamed of. In addition to the size and variety of stocks necessary, other conditions have forced not only a less volume but also a constantly lessening margin, until to-day "What it costs to do business" has become the question of the hour. Indeed, with the manufacturer selling at practically uniform prices, and forced by his conditions to constantly scheme for more, and on the other hand the consumer in order to get his supplies for less, resorting to commercial persecution, the retailer finds himself in a most trying position. It recalls the story of the kind traveller who saw a sorrowful looking boy hoeing under the melting heat of a July run. He called, "Say, boy, what do you get for hoeing?" The boy looked up in astonishment, saying, "What do I get for hoeing? Nothing," "Then why do you do it?" "Get hell if I don't," said the lad. That is about the case of the retailer, except under the present law he faces the pen if he does and bankruptcy if he don't get a profit.

Doing Business in the Dark.

When the experience of others had convinced me of the value of cost information, I asked a dealer who carries a stock of $35,000 to $40,000 what it cost him to do business. He answered, "I know exactly—have just got through figuring. It is a shade under 9 per cent." Having this meeting in mind, I offered to bet him a new suit of clothes that 19 per cent. would be nearer than 9. So we got to talking about the costs of doing business. Asked, had he figured interest. "Well, no," he had not. That one addition jumped him to 15. Had he figured rent? Had not, didn't rent, owned the ground, but admitted it could be rented to others at about $800. So we went over the various items in a sort of estimating way. Later he reported to me that without figuring depreciation or interest on carrying accounts over six days, his total expense was "Just a shade under 20 per cent." So I put it up to you. What is your cost of doing business? Fill out the item approximately. It will vary for each firm and for each locality, but it is a "privileged communication," even under the anti-price-fixing laws in force in our respective states. I have called this rambling talk "Publicity of the Cost of Doing Business; A Remedy for Some of the Ills Retailers Have." By this I do not mean that it is desirable to shout from the housetop to every passerby, but I do mean that it is desirable beyond my ability to tell, that a complete record of actual costs, including your salary, interests and rent, should be always ready to exhibit to anyone interested or in any court of law. Let it all be open and above board. Let me illustrate with a story. In circuit riding days a minister had a portable bathtub which he forbade any member of his family to use. But from the appearance of the tub he concluded his housekeeper was using it, so he called her into his study. When she admitted it, he said, "Mary, what grieves me most is that you do behind my back what you would not do before my face." Don't make a record behind the desk you would not willingly make before your customer, if need be. Tell him you are charging a profit of 10 per cent. He will concede that it is reasonable, the general public will hold that it is reasonable, and courts of law will allow it. If it shall be contended that the publicity suggested might get into wrong hands, the answer is that it can be of no value to him or injury to you, and while it will get into the wrong hands once in a while, it will also go into the right hands all the time—the hands of your competitors, who will use your cost in checking up their own.

Every man should consider his business as a thing apart from himself—as that part of the world that owes him a living and more. Citizen Jones and Business Jones should be considered as separate. The main object in life for Citizen Jones should be to make Business Jones come across. If he does not do so, then the general public usually adds a third name, which sounds like Dam Fool Jones.

The Ten Commandments of Business.

In conclusion, Mr. Barry read the following ten business commandments and thirty-nine articles of business faith:

To arrive at YOUR cost of doing business:

1. On the beginning of your business year charge interest at the rate you could loan your money, on your total investment exclusive of real estate.

2. Charge rental on all real estate and buildings used in your business at the same rate you would receive if renting to others.

3. Charge in addition to what you pay for hired help, the amount your own services would bring from others; also charge in the same way for the services of any member of your family.

4. Charge depreceiation on all stock carried over, on which you have to make a reduction to sell.

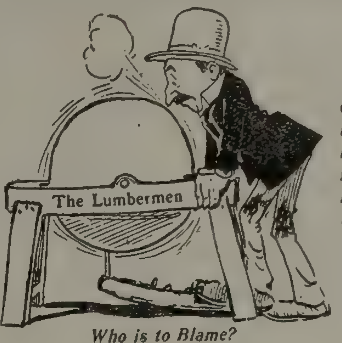
5. Charge all expenses, such as taxes, insurance, water, lights, fuel, drayage, postage, office supplies, maintenance of horses and waggons, advertising, telegrams, phones, canvassing and donations.

6. Charge losses of every character, including stock stolen or sent out and not charged, allowances made to customers, bad debts, etc.

7. Charge collection expenses; also any and all other expenses not enumerated herein.

8. To reach your inventory in January 1, 1910, and all your 1910 purchases plus the freight and from their sum subtract your inventory of January 1, 1911. Now divide by this remainder the sum of all your 1910 expenses. The result is the per cent. on the inyard cost of the stock you paid to do your 1910 business. For example, suppose your inventory to January 1, 1910, to have been $12,000; your 1910 purchases, $38,000, or a total of $50,000. From this total subtract your January 1, 1911, inventory of say $10,000, leaving a remainder of $40,000 as the inyard cost of the material you sold in 1920. Now, suppose your total expense to have been $6,000. Then divide $6,000 by $40,000, giving 15 per cent. as your cost of doing your 1910 business.

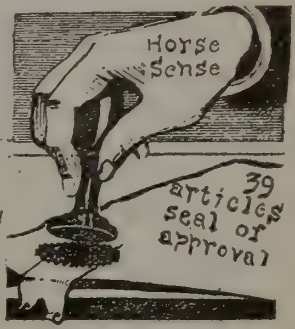
The 10 Commandments of Business



The Dry Grind is the Penalty for Breaking the Commandments.

Who is to Blame?

The 39 Articles of Faith



The 39 Articles show how the 10 Commandments of Business should be applied for the salvation of lost dividends

9. Hence in this assumed case the net cost of each item is the delivered price plus 15 per cent. When the delivered price of 2x4's is $20, you must add 15 per cent. to play even, making your net cost $23. To this add your profit. While all items can not sell at the same percentage of profit, yet no item should sell below your net cost, as determined by the above method which gives the nearest practical approximation to the real thing.

10. Record in even greater detail than suggested by the following "Thirty-nine Articles of Faith," all expenses as if to make a public exhibit of the actual cost of doing your business. Then when your books show a profit, it will be real when you collect it—and not merely apparent. Public inspection should be welcome—yes, even solicited.

The 39 Articles of Faith	Per Cent of Annual Depreciation	FIRST COST		Expenses for Year Ending ....191...	
EQUIPMENT					
1. Buildings					
2. Motors					
3. Office F'ur & F'r					
4. Office Machines					
5. Scales					
6. Teams					
7. Tools					
8. Trucks					
9. Wagons					
10. Woodworking and Sawing M'ch'es					
FIXED EXPENSES					
11. Association Dues					
12. General Office Expense (Not included elsewhere)					
13. Insurance—Fire					
14. Insurance—Liability					
15. Interest on net investment					
16. Interest on accounts running over 60 days					
17. Rent					
18 Salaries					
19. Taxes—Personal—on stock etc.					
20. Trade Papers					
Amount carried forward					

The 39 Articles of Faith	Expenses for Year Ending ..191	
RUNNING EXPENSES

In-yard-cost of stock in 191—sales		

By this last amount, divide total expenses. Now, OBEY ye henceforth the COMMANDMENTS that like Moses, YOU too may be permitted to view the "PROMISED LAND."

Thirty-Nine Articles of Business Faith.

The 39 articles of business faith as given by Mr. Barry were as shown above:

In explanation of some of the above articles Mr. Barry said:

The measure of the annual depreciation of any article is such a per cent. of its first cost, as will replace it new when repairs are no longer economical. Your experience is the guide.

7. Is to cover all appliances not included in other items of equipment.

12. If a line yard, include here the proportion of general office expenses.

13. Includes all paid for fire protection, not otherwise charged.

15. Interest. Net investment is total investment less real estate, if any.

17. If ground is owned, then the rent is such as might be secured if rented to others.

18. Salaries to include the same pay for the active proprietors or any working members of their families, as they would receive were they working for others.

21. Advertising—including newspapers, circulars, programmes, souvenirs, entertainment of customers—in short all paid for publicity.

23. Bad debts, include both notes and accounts.

24. Collections, include amounts paid in addition to regular pay roll.

25. Depreciation applies to any stock the sale value of which is damaged.

26. Donations—to cover all values given away and not elsewhere charged.

27. Freight to include all transportion charges except those for stock bought delivered.

29. Interest on temporary loans in excess of net investment. See No. 14.

30. Miscellaneous to include all times not otherwise herein provided for. But the less in "miscellaneous" the better.

Lumber Matters in the Law Courts

Important British Columbia Judgment Regarding Responsibility for Forest Fires — Action for Injuries Sustained in Running Logs

Safety of Log Chutes—An interesting legal case relating to the safety of a log chute is at present in the British Columbia courts, in which the plaintiff, Mr. Mitchell, is suing the Rat Portage Lumber Company for $15,000 for the loss of an arm. The action hinges on the question of whether log chutes, for sending logs into the water, can or can not be rendered completely safe. To settle this vexed problem much evidence has been called, and some interesting logging lore was vouchsafed by western lumbermen. One witness said that he had been engaged in logging operations for 54 years. He said there was always danger on a swift-running slide, and that he always felt a sense of relief when a log was safely in the water. Asked what made logs jump the chute, he brought forward the suggestion that the swift-moving timber compressed the air in front and under it until this gathered force enough to throw the log from the chute. When asked whether the first duty of the man at the foot of the chute was not to keep the logs cleared away from that spot, the witness said no. "Then what is it?" he was asked. "To take care of himself," said the witness.

Timber License Not Seizable—That an interest in a special timber license is not an interest in land, and is therefore outside seizure under a court judgment, was the ruling laid down by Mr. Justice Morrison in an important judgment delivered at Vancouver recently in the case of P. F. Newell vs. John Trainor. The case was one in which the plaintiff secured a judgment against the defendant Trainor to the extent of $1,629.80 and costs. An application was then made before Mr. Justice Morrison in the Supreme Court for the defendant to show cause why his interest in certain special timber licenses held from the Provincial Government, as well as the timber governed by these licenses, should not be sold to realize the judgment against him. At the time of the application in chambers the point was raised, in reply, that a special license to cut timber did not constitute an interest in land within the meaning of the Judgments Act. Mr. Justice Morrison, in his finding, declares that he considers this point well taken. He proceeds to show that section 54 of the Provincial Land Act dealing with licenses draws a clear distinction between timber leases, crown granted timber land, hand-loggers' licenses and special timber licenses. "It seems abundantly clear to me," he says, "that the Legislature has not given, nor intends to give, an interest in land through special timber licenses. An interest concerning or affecting land is not to the present purpose." Referring to a judgment of Mr. Justice Murphy in the case of Vaughan Rhys vs. Clary, he quotes the words "any contract, or obligation, or liability affecting land or hereditaments," and then comments to the effect that this is a question of substance, not words, and that if a timber license meant an exclusive occupation of land it would constitute under the law a demise of the land itself. If this were meant, the instrument and the statutory provision would clearly state it in terms. "Trees while in the ground are merely in a warehouse" is a quotation given from another important legal finding in a similar connection.

In the definition of land under the Judgments Act, interest in it is referred to as "title in," etc., and the right of entry. Mr. Justice Morrison contends that this right of entry is the right known to real property lawyers and is not the right to enter for a special purpose such as provided for under a special timber license.

Responsibility for Forest Fire.—A law suit of great importance to the lumber industry of Canada has just been heard in the courts of British Columbia. The point at issue was the responsibility for a serious forest fire which commenced on July 16th last on limits purchased by Mr. E. R. Clarkson, of Toronto, from the Great Northern Railway Company in 1906. The defendants were the Nelson & Fort Sheppard Railway Company, who were accused by the plaintiffs of having caused the fire. The statement of the plaintiff was to the effect that the fire started near Ymir, B.C., as the result of the burning of some old railway ties which the railway company were destroying.

The principal witness was one of the foremen of the railway company who was in charge of a section gang in the district in which the fire commenced. This foreman in a telegram to the company at Nelson, on July 18, said "fire caused by burning old ties." In his evidence the foreman said that the last rain previous to the fire had been on June 30 and that by July 8 the conditions were favorable for a fire, as the right-of-way on his section was strewn with dry rotted hemlock logs, willow brush, kinniginic, ends of ties, leaves and grasses, and other inflammable materials. All the section foremen had instructions from the assistant roadmaster to burn at the end of each day's work all the old ties they took up. He first saw the fire on July 11. It had then burned over a small area and when he left, it appeared to be out. On the following day there appeared to be no signs of fire. He reported to the assistant roadmaster that gangs were setting fires, which practice ought to be stopped. The next day he saw fire rising from the ashes of the burned area and requested the assistance of the fire warden. A day later the fire revived and was running up the trees, so he and his gang of eight men dug around them, putting earth on the blaze. The next day he saw no sign of smoke. That evening, however, the fire warden summoned him. A gale had fanned the fire, which had spread across the river and crossed the railway track in three places. He knew of no other cause for the fire than the burning of the pile of ties on the section adjoining his, where he had first seen the flames. The witness was put through a long series of cross-questions but kept pretty closely to his story.

The defence presented witnesses to prove that the fire had been caused by prospectors or campers.

The case was heard by Mr. Justice Morrison and a special jury. A verdict was given placing the responsibility upon the railway. The responsibility was the only question to be decided by this jury. The question of damages will be decided by the Supreme Court. The plaintiff claims over half a million dollars and other claims aggregating as much more depend upon the result of this action.

International Paper Company Oppose Reciprocity

The International Paper Company have forwarded a protest to the United States Congress against the ratification of the reciprocity agreement. The memorial of protest is in part as follows: "If the proposal regarding paper and pulp in the McCall bill, covering the trade agreement with Canada, is enacted into law, it will, without question, paralyze the paper industry and eventually result in the almost complete annihilation in this country of the manufacture of paper made of pulp wood. Here and there may be a mill with exceptional advantages. . . but there is no doubt that, in the main, the industry will go over into Canada, and that a very large number of skilled laborers will have to leave this country to find employment. We regard the so-called 'trade' as being a very costly one for the United States, in so far as it relates to our industry. It is proposed to let in free paper and pulp in exchange for the privilege of getting Canadian wood, but when our mills have gone out of existence in this country, and no longer require Canadian wood, Canada will have the industry and we will have nothing. With a moderate duty on paper, the industry, as it exists to-day, can perfectly well be preserved in this country, and it is, in our opinion, a blunder to open our markets to Canadian competition for the sake of getting these restrictions on wood removed. No doubt, in any event, much of the future growth will be in Canada, but that is no reason why the existing industry should be blotted out."

S. M. Smith, general manager of the British America Mills & Timber Company, Limited, of Winnipeg, was in Toronto recently on a short business trip.

Mr. M. P. Kinsella, New York manager of Skillings, Whitneys & Barnes Lumber Company, and Mr. M. H. Haney, Ottawa manager of the company, made a business visit to Toronto last week.

Mr. J. H. Simpson, of Detroit, who has considerable interests in timber lands in British Columbia, is on a trip to the east and recently visited Toronto and was a welcome caller at the offices of the "Canada Lumberman."

Lumber News from Quebec Province

Premier Gouin Makes Interesting Statement Regarding Policy on Pulpwood Export—The Township Forest Reserves

Sir Lomer Gouin, Premier of Quebec, in a reply to Mr. Bourassa in the Quebec Legislature, made an interesting reference recently to the pulpwood situation. Mr. Bourassa had asked whether the government would make an announcement of its policy in connection with the pulp resources of the province, as effected by the proposed reciprocity arrangement between Canada and the United States.

Sir Lomer Gouin's reply was as follows:

"I have followed this question very closely, but, as a matter of fact, I do not know yet, officially, if any decision has been reached respecting the signing of the treaty. I do not say this in any spirit of complaint of the procedure followed by any party to the negotiations, but to justify myself in saying that I cannot very well define what the Quebec Government's decision will be upon this matter.

It was only in April, 1910, that an Order-in-Council was passed prohibiting the exportation from Crown lands into the United States. We are putting that order into execution, and now that the question of reciprocity has come up I am asked to state if the Government intends to modify that order.

"That order was passed in response to a strong desire of the public in the province to have the Government take some such action, as witnessed by the attitude of the press of both political parties. I admit that we have received requests from limit-holders in the province asking that this order should be repealed.

"After having read much of what has been written in the newspapers, both in the United States and in Canada, it would appear that there is a very strong opinion in Washington in favor of admitting lumber, pulp, and paper free into the United States from Canada, whether the agreement now under discussion is approved or otherwise.

"I am not ready at the present time to state what decision this Government will take in relation to the matter—whether we will change the present conditions, or whether we will not change them. The ambition of the Government, I may say, is to make Quebec the centre of the pulp and paper industry of the world.

"The action of the Government would be, if I had to choose between the interests of our neighbors and Canada and Quebec, to stand first by Canada and the Province of Quebec; and if the choice were between Canada and Quebec, providing the interests were legitimate, I would stand by the Province of Quebec."

The report of the Provincial Treasurer of the Province of Quebec shows receipts from the Department of Lands and Forests for the year 1909-10 to be $1,150,747, an increase of $75,980 over the figures of the previous year. It is expected that the revenue for the next fiscal year will show a further increase of at least $300,000. This increase is expected to come from the operations of the new tariff of timber dues which was recently put into force. The increased rate of $5 per mile ground rent is expected to yield an increase of at least $140,000 a year. As far as can be learned from present operations it is not expected that the changes in the tariff regarding stumpage dues will materially affect the annual lumber production of the province. The timber dues on the lumbering operations for the forthcoming year are expected to reach $1,000,000. In addition to the increase in revenue, as a result of the new tariff, the province is benefiting by the introduction of new industries and by the manufacture of raw products of the forest. This is giving a great stimulus to capital and increasing the demand for skilled labor in the province.

Resolutions have been introduced into the Quebec Legislature by Hon. Jules Allard, Minister of Lands and Forests, in connection with the cutting of timber on township forest reserves. The object of the resolutions is to enable the small proprietor or farmer to cut timber and wood on these reserves, upon payment of the stumpage dues. The general object of these reserves is to insure constant supply of timber in each township of the province, to prevent the clearing off of land recognized as unfit for cultivation, and also to restore the value of land which has been injured by fire, as well as to protect the sources of the streams. When the resolutions were first presented a short time ago, they provided for the sale by auction of the right to cut timber, for a period of two years. This, it was felt, would be in the interests of the large investor instead of the small proprietor. A change was accordingly made as indicated above, and provision also included that the sales in each reserve must not exceed 1/20th of the total area of the reserve, and that no one applicant should receive more than one concession in the same year. A bill embodying these resolutions will shortly be presented to the House.

There are at present 25 pulp mills in the Province of Quebec, whose whose total average daily output is 2,839,000 pounds. There are 20 paper mills, with an average daily output in aggregate of 1,343,000 pounds. To turn a cord of wood into pulp costs $3.20, and to convert the pulp into paper it costs $15.20. During the past five years there have been exported from patented lots 480,000 cords of pulpwood. No substitute for spruce in making news papers has been found, although the United States Government has spent $30,000 in researches and has established a laboratory at Wausau, Wis., for this purpose. Black spruce is used for saw logs, wood pulp, posts, piers, matches and wooden bowls.

Mr. E. Stewart has established an office in the Lumsden Building, Toronto, to handle Canadian timber limits. We understand that he has some splendid properties to offer in British Columbia. Mr. Stewart was for many years Superintendent of Forestry for the Dominion Government and has wide acquaintance with forestry and the timber possessions of Canada, placing him in a splendid position to give excellent service to his clients.

Following is the value of lumber shipped from the Ottawa Consular District, to the United States, during the calendar year 1910: Clapboards, $14,112.39; hemlock, $11,353.49; lath, $113,812.26; pickets, $64,022.48; railway ties, $20,700.48; shingles, $46,977.41; spruce lumber, $344,841.06; spruce plank, $18,006.43; white pine deals, $49,870.48; white pine lumber, $1,795,523.46; white pine plank, $18,711.58.

Special Reports on Foreign Trade

Dominion Government Obtaining Information Regarding Lumber Trade Opportunities in Other Countries

The Canadian Department of Trade and Commerce has requested its commissioners to make special reports upon the market for forest products in the countries where they are stationed. The following outline of suggested subjects was sent to each commissioner:

1. Amount of forest products imported and possibilities for developing Canadian trade.
2. (a) Timber—various kinds and sizes, sawn and hewn.
   (b) Lumber—kinds and sizes of deals, boards, planks, joists, etc.
3. Grades—commercial names of grades, classes, etc.
4. Market for logs, telegraph and telephone poles, posts, railway ties and sleepers, pulpwood, ground and sulphite pulp.
5. Transport facilities—labor problems, handling cargoes, steamers discharging at wharf or anchorage, wharfage dues, additional charges, such as towage, lighterage, transfer, etc.
6. Telegraph, cable and railway facilities, custom as to discounts and settlements.

The Canadian Trade Commissioner in Holland, in a brief report states that Holland was once rich in forests, but that the timber wealth has all been exhausted, and only within recent years have efforts been made to reforest the country.

Notwithstanding the extension of forest plantation in the Netherlands during recent decades, the active demand for foreign lumber that has existed for many centuries, is likely to continue. The re-export of timber and lumber developed enormously in the course of time, the result being that the initial trade with Northern European seas continues of great importance.

In 1908 the imports of all kinds of woods, except dye-wood, amounted to 2,792.346 tons of 1,000 kilograms each. The exports in the same year were 1,782.544 tons. In 1909 the imports were 2,624,689 tons and the exports 1,621,173 tons.

It will be seen from these figures that not only has the local consumption increased, but the transit trade is also of great importance to Holland. About 60 per cent. of the timber and lumber from the different countries of origin is received at Rotterdam, the greater part of which is exported via the Rhine to Germany. The remainder reaches Amsterdam, Zaandam, Dordrecht, Middleburg, Harlingen, Delfzijl, Terneuzen, and is mostly intended for local consumption.

Pitch pine from the United States, white and red pine from the Baltic and the White Seas, and pine and oak from the Black Sea and the Adriatic are mostly utilized in building and furniture. The railway sleepers are the beech of West Russia and the Rhine provinces, and the red pine from the Baltic and White Sea, the larch from Archangel, and the oak from Dantzic, Libau and Memel.

Square timber from the United States and Canada is principally required in the construction of dikes, scaffolds, and quays. Cedar from Dutch Guiana and Cuba and North America is chiefly used in the manufacture of cigar boxes. The demand for timber from the West Indies especially Dutch Guiana, is increasing. Greenheart and marbarklak are particularly adapted for hydraulic works; amaranth, brownheart, exclusively used in joinery; locust or teak for the waggon industry, and the bullet tree for parts of musical instruments.

There is a large importation of staves for barrels and casks from the United States, the larger sizes required for the manufacture of hogsheads are mostly exported to Germany. The smaller sizes are used in Holland in manufacturing barrels required by local herring packers.

Timber, lumber and wood generally are of great commercial importance to the Netherlands. Outside of the fact that most of the buildings in Holland rest on piles, naturally causing an active demand for

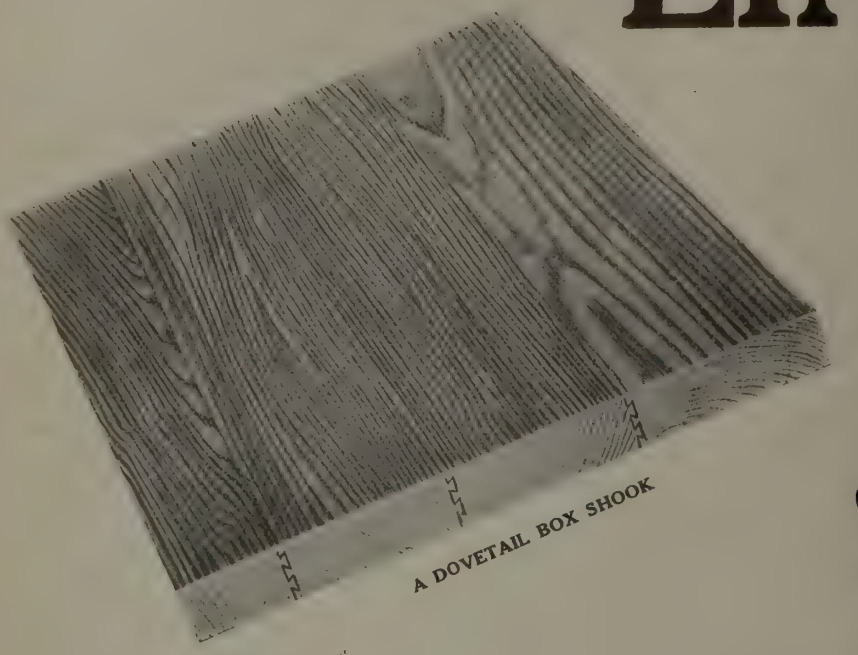
LINDERMAN

DOVET



JOINTER

A
N
I

Joins All Kinds of Lumber Toge

PACKING BOXES AND COOPERAGE

With the dovetail way of matching lumber installed in your factory, you can use narrow and low grade lumber. Merely cut it to length, feed it into the

Linderman Automatic Dovetail Glue Jointer

from both ends at the rate of 80 feet per minute and your packing box sides, ends, tops, bottoms and heading squares will come out of the centre of the machine complete and sized to the exact width without lumber waste.

Dovetail shooks are as perfect in appearance as one piece wide stock and are stronger than the natural wood itself. Dovetail shooks can be made at the same or less cost than ordinary tongue and grooved shooks; yet the value of the dovetailed product makes your low grade lumber worth the same price as wide.

timber of suitable dimensions, wood also serves as raw material to many important industrial branches, among them being: Saw and planing mills, turnery, joinery, manufacturing of carriages, waggons and push-carts, cooperage, packing boxes, wooden shoes, baskets, barrels, cigar boxes, furniture, etc.

It will be seen from the foregoing that there is a good opening for Canadian timber and lumber. The official figures for a recent year show importations of 250,000 standard battens or planks, and about 800,000 pieces of square timber. The cost of lumber is computed f.o.b. per St. Petersburg, standard of 165 English cubic feet. The ordinary method of retailing is per Amsterdam foot, 13 feet English is equivalent to 14 feet Amsterdam measure.

Last year the average prices of 165 English cubic feet were—11 inches wide, average 132 guldens, down to 4 inches wide at 92 guldens, f.o.b. The thickness of this lumber was from half an inch to three inches.

Round timber is used in pile driving for the foundation of buildings. These piles are usually from 16 yards long, 5 inches in diameter at the top and 9 inches at 1 yard from the butt. This timber costs about 40 cents Dutch (16 cents currency) per running meter c.i.f. in Russia or Sweden.

The Band Resaw—Theory of Its Use

Why it Holds Its Place On the Wheel—Correct Method of Fitting to Produce a Perfectly Straight Cut

An excellent paper upon the subject of "Band Resawing," by Mr. E. C. Mershon, of Saginaw, Mich., was presented at the recent meeting of the Hardwood Manufacturers' Association of the United States. After referring historically to the development of the band resaw, Mr. Mershon's paper continued in part as follows:

We found that the same general principles apply to a band saw as to any saw, whether it be a hand saw, meat saw, circular saw or a band; that the toothed edge that does the cutting has to be taut; that the teeth themselves have to have proper clearance; that a band saw especially is a good, rigid tool for cutting in a plane parallel with the blade; and that it is a poor tool, indeed, to withstand any pressure perpendicular to this plane, or, in other words, to withstand any side pressure. We found that to give the blade the greatest capacity for withstanding shocks and pressure in a fore and aft direction, namely, in the direction of the feed, that the saw blade had to be fitted to the wheel, the greatest amount of strain being exerted by the wheel towards the toothed edge of the blade to give it the tautness referred to above; the next greatest strain towards the rear edge of the blade so as to form it in a truss, as it were, to withstand any tendency to deflect the blade by the crowding of the feed, dulling of the teeth, etc., and that it was necessary to expand the blade by means of the hammer or stretching roll so that the wheels would give the least strain to the central portion of the saw blade.

It will be seen that a saw blade thus tensioned by the hammer or roll, made to run on the wheels with the toothed edge projecting beyond the face of the wheel a sufficient distance, so that, say, ¼-inch, more or less, of solid metal would project beyond the face, likewise would be made to alter its form entirely if it be forced backward on the wheel this ¼-inch. This ¼-inch of ribbon just back of the base of the teeth, being the shortest part of the blade, being made to mount the wheel and being elastic, would stretch and tend to make the rear edge of the saw appear concave and thus would automatically guide the blade forward on the lower wheel until it regained its normal position and the blade again became straight in the back. It will thus be seen that we learned why it was necessary and desirable to properly tension the saw, that is, the correct tensioning of a band saw is that which forces it (against fore and aft strains) to retain its normal position on the wheel, as, in shifting forward or backward, the saw-blade changes its entire form, rendering the back edge more or less concave or convex as the saw goes backward or forward.

The Theory of Band Resaw Fitting.

Having indicated why the band saw holds its place on the wheel and becomes a rigid and substantial tool for withstanding strains and stresses exerted in the plane of the line of cut, the next thing I wish to explain is the theory on which a band resaw should be fitted in order that it may cut in a straight line and not be deflected from side to side. The two essential things to be borne in mind are to so treat the saw as to give the cutting points of the teeth the most rigid support. This is accomplished by the tensioning of the saws as above described. A saw thus tensioned and strained on the wheel has a "puckering string," as it were, located directly at the base of the teeth. A sheet of paper can be drawn in a straight line through a lump of soft wax and cut it through and through, leaving a plane surface, if the sheet of paper is held taut at its front edge. This would not be possible if the sheet of paper were made taut back an inch or two from its front edge. This shows that by the tensioning of a thin saw blade from edge to edge we have provided the best support for the saw tooth which projects from the extreme edge.

Thus having fitted the saw so as to support the tooth in the best possible manner, the next thing to be studied is to remove all possible side pressure from the points of the teeth, and, by so doing, to remove all tendency for the tooth to dodge from side to side. This is accomplished by allowing only the sharp cutting edge of the tooth to come into contact with the timber to be sawn. In other words, the point of the tooth is spread or expanded and filed so as to give a chisel like edge thereto. As this cutting edge is provided to cut solely in the direction of the line of cut or parallel with the saw blade, the corners of the teeth should represent only a line extended, namely, a needle point, and the steel supporting this needle point should recede so as to give clearance both in the direction in which the timber is fed and in the direction in which the saw blade travels.

The old Disston upset or conqueror swage gives an ideal form to the point of the tooth. We used to describe this form as being bugle shaped. With a saw fitted with the Disston Conqueror swage and not otherwise treated, I have no difficulty in sawing with what might be also termed "absolute accuracy." I have brought with me to-day for inspection some samples of picture backing; made seven pieces from stock 1 inch in thickness before resawing. The saw kerf in these cuts removed was but 1/20-inch. The saw blade which did this work was .030 inch thick, practically 1/32-inch thick. One-half pound pressure exerted against the saw blade from side to side would have made this saw dodge over 1/16-inch and spoiled this work. In actual practice we have run saw blades of the thicknesses stated, sawing this material, for days at a time and have had remarkably few saw culls.

Importance of Studying Technical Detail.

Other technical points have to be considered; the amount of hook given the saw—a sufficient amount to prevent its shifting on the wheel and not enough at any time to cause it to run ahead, as in doing so any teeth which might be at that instant in the cut might suddenly imbed themselves in the timber and great damage result. I have before now, in sawing black walnut, happened to give the saw a little too much hook, when suddenly an upward curve of the grain has caught the teeth of the saw in such a way that they have jumped forward like the teeth on the Boss dog, and the blade has been instantly stopped in the cut. This was done so suddenly that the lower wheel of the resaw continued to revolve for a short space of time, actually slipping around within the saw blade.

The difficulty which one has to encounter in advocating the use of the thin blade is largely due to the fact that sawmill men do not know the tensile strength of band saw blades turned out by the leading manufacturers. The strength of these saws in the braze, namely, the weakest part of the saw, is 140,000 pounds per square inch. Take a 14-gauge, 12-inch saw; each strand represents practically a square inch of cross section. Thus the descending strand and ascending strand would represent two square inches. The breaking strain of such a blade is this, that if the strain were evenly distributed it would be 280,000 pounds. If you allow yourself a factor of safety of twenty, you could safely carry a strain of 14,000 pounds on such a blade. I think it may safely be said that none of you are carrying a strain of over two-thirds this amount. Now, if you would decrease the thickness of your saw blade one-third and retain your present strain yould would do as good work certainly, as you would not require as much strain to take out 3/32-inch of saw kerf as you would to take out plump ⅛-inch saw kerf. This would be on the same principle that it does not take as much power to make a ½-inch chisel cut a ½-inch mortise as it does to cause a ¾-inch chisel to cut a ¾-inch mortise. The sawmill men are growing more and more to appreciate the ability of the resaw to increase the capacity of the mill.

On the Pacific coast they have standardized the mill, making a position for the resaw alongside of the sorting chains, placing jump rolls in the sorting chains by which the inspector can send any stock that he wishes to resaw by means of driven rolls, transfer chains, etc. The resaw feeds the material back again on the sorting chains, when it again passes to the jump rolls and may be returned for resawing a second or third time, as desired. In other words, they have this matter solved very nicely on the coast, making it a simple operation to install a resaw actually outside of the mill proper in a position adjacent to the front end of the sorting table, so that any stock which is sent from the sorting table to the resaw is returned to the table at the front end thereof and in such a position that it can be disposed of as seems best, to either resaw a second time or otherwise.

Here in the East where the timber is small, it is often desirable to install the resaw in the sawmill in front of the edger, as by so doing a saving can be effected in edging. A 2-inch plank with wane and bark thereon when made into two 1-inch boards, will yield one board much wider than the other. This extra width is just so much gained. This installation has become standard in the East.

5,000 Facts about Canada

The 1911 edition of this indispensable collection of concrete, crisp Canadian Facts, edited by Frank Yeigh, of Toronto, the well known lecturer and writer, and author of the new book, "Through the Heart of Canada," has been issued and is filled with fresh data of a most interesting and illuminating character. It is a marvel of condensation, presenting in small space striking figures relating to every phase and department of Canada's resources, trade and national life. Its popularity and wide sale can easily be understood. The booklet may be had from the leading newsdalers, or for 25 cents from the Canadian Facts Publishing Company, 667 Spadina Avenue, Toronto.

LARGE AMERICAN FIRM MANUFACTURing a complete line of lineman's tools, and portable saw rigs for builders, contractors and lumber yards, wants Canadian Representatives. For particulars apply Box 222, CANADA LUMBERMAN, Toronto, Ont. 5-6

Planing Mill For Sale

FOR SALE—$6.000 PLANING MILL, LUMber yard and box factory; old-established business, good reasons for selling, easy terms. D. C. BAIRD, St Mary's. 3-8

For Sale

SASH AND DOOR FACTORY SITUATED IN situated in Killaloe on Grand Trunk line. No factory within 20 miles East and 150 miles West. Well equipped and in a good farming community, doing a good business. Reason for selling (death) For further particulars apply to MRS. C. T. ECKEL, KILLALOE, STA. ONT. 2-5

Timber and Land Investment

FARM OF THREE HUNDRED ACRES within 35 miles of Toronto—one hundred acres of which is timber land—Pine, red and white Oak, Maple, Beech, Basswood, etc. Balance of farm is under cultivation, thirteen acres bearing apple orchard Buildings cost over five thousand. Price, $29,000. Box 160, CANADA LUMBERMAN, Toronto, Ont. tf

Canadian Timber Limits

Bought and Sold in all parts of Canada

Some excellent investments open in British Columbia at moderate prices.

E. STEWART

Room 504 Lumsden Building, Toronto. Telephone Number Adelaide 105. Correspondence invited. 5-10

MISCELLANEOUS

Headquarters for Timber, Mills and Farm Lands.

WE HAVE TIMBER IN ALL PARTS OF British Columbia Tracts from 3,000,000 to 500,000 000 feet; some on water, some on railroad propositions. All with good harbours. Full particulars given. Address KEY WEST REALTY CO., 333 Cambie St., Suite 8, Dominion Trust Building, Vancouver, B.C. 5-5

For Sale

OVER THREE HUNDRED THOUSAND acres of the finest mixed timber in Ontario, consisting of hemlock, cedar, spruce, basswood, black ash, balsam, elm, tamarac, birch, maple, beech; also considerable pine. This timber can be bought in block of from 1,000 to 10,000 acres. There are several good mill sites on the property, good water privileges and good railway accomodation. This would be a chance for parties already cut out and looking for a new location. For further particulars apply to the owners.

THE CANADIAN LAND & IMMIGRATION COMPANY of Haliburton. Limited, 79 Adelaide St., East, Toronto. 5-6

TENDERS FOR PULPWOOD LIMITS.

Tenders will be received by the undersigned up to and including the 10th day of April next, for the right to cut pulpwood on certain areas situate:

(1) On the Abitibi Lakes and River tributary to the Grand Trunk Pacific Railway, and Northern Ontario Railway, in the District of Nipissing.

(2) On Rainy Lake and around the shores of Lower Manitou Lake, tributary to Fort Frances on Rainy River, in the Districts of Rainy River and Kenora.

Tenderers shall state the amount they are prepared to pay as a bonus in addition to dues of 40 cents a cord for spruce, and 20 cents a cord for other pulpwoods, or such other rates as may from time to time be fixed by the Lieutenant-Governor-in-Council, for the right to operate a pulp and paper industry on or near the areas referred to. Such tenderers wil be required to erect mills on or near the territories and to manufacture the wood into pulp and paper in the Province of Ontario.

Parties making tenders will be required to deposit with their tender a marked cheque, payable to the Treasurer of the Province of Ontario, for ten per cent. of the amount of their tender, to be forfeited in the event of their not entering into agreement to carry out conditions, etc.

The highest or any tender not neressarily aucepted.

For particulars as to description of territory, capital to be invested, etc., apply to the undersigned.

F. COCHRANE,
Minister of Lands, Forests and Mines.
Toronto, Ont., Jan. 10, 1911. 3-7

Australian Railway Ties for America

A shipment of 70,000 railway ties of "stringy bark" (Eucalyptus obliqua), sometimes termed Tasmanian oak, left Hobart for the United States at the end of October. Two similar shipments will follow, probably in March and June of 1911, making a total of 210,000 sleepers of Tasmanian timber for the United States.

Stringy bark is much in demand for railway sleepers, being nearly everlasting. Some forest tramways in use by Tasmanian saw mills were laid with stringy-bark sleepers more than fifty years ago, and they are still perfectly sound, after withstanding an enormous heavy timber traffic daily. The average use of these sleepers resting on gravel ballast and subjected to a rainfall varying between 20 and 60 inches per annum, is about fifteen years, but they have been taken up after twenty years of use and found perfectly sound. The wood, being practically non-inflammable, makes a valuable safeguard against conflagrations in tunnels, and is especially suitable for underground railways. Stringy bark is marvelously non-absorbent and resistant of damp, making some of the finest railway sleepers in the world, and is comparatively immune from the ravages of white ants and other land insects.

The Tasmanian wood being hard, bedplates are not required under the rails of the Vignoles section of rail. The holding for spikes is good and the splitting of a sleeper is a rare occurrence. On the Tasmanian main line (3-foot 6-inch gauge) stringy bark sleepers are used. The alignment of the track is very sinuous, many of the curves being only 330 radius, and yet even on these sharp curves so great is the holding power of the spikes in the sleepers that no bearing plates or re-enforcing braces are used.

Stringy bark is especially suitable for harbor construction, being one of the densest timbers in the world and immune from the attacks of marine insects. It is one of the few kinds which can be obtained in great lengths and contains a resinous substance which resists the Xylophages. There is an essential oil in the wood which prevents it rotting under exposure to moisture, and at the same time acts as a preservative to iron. It stands great exposure to heat and damp, besides possessing the valuable property of repelling the white ant and teredo worm.

The timber is of great value in building breakwaters, docks, etc., as its high specific gravity is such that it is unnecessary to weight the piles to get them into position when in deep water, thus saving a great expense. As an instance of the durability of stringy bark when used for piles, a sample of this wood was recently taken from a Hobart pier. It was certified to by the engineer of the Hobart Marine Board; after being under the water for thirty to forty years it was still perfectly sound.—Vice-Consul-General Henry D. Daker, Sydney.

Straight or Twist Belts

Whether it is better to run belts straight or twisted seems to be a question worth considering. Both methods have many supporters. Some will not have a twist belt at any price, others have them wherever possible, while there are others (the writer included) who are not on either side of the fence but have a leg dangling on each side. There are so many things to be considered in laying out a drive for any particular machine that it is impossible for anyone to say off-hand which will make the best drive—straight or twist. A main driving belt should always be straight where possible, and arranged in such a way that the under side is the pulling side, while the top will have the benefit of the slack or sag of the belt to make it hug the pulley closer and so save slipping. The distance between pulley centres, and the relative position of the driving to the driven pulley, must necessarily play an important part in the summing up of the engineer's decision as to whether a straight or twisted belt will give the best results. If your pulleys are placed wide apart and there is not too much difference between the diameters of them, use a straight drive by all means. But should you have to drive a countershaft or a machine, and the pulley is directly underneath the driving pulley on the shafting, then use a twist belt every time, as the vertical drive is never satisfactory with a straight driven belt. Although the proportion between the diameters of a driving and driven pulley should not exceed 6 to 1, there are often cases where it is necessary to increase that ratio, in which case a twist belt becomes an absolute necessity, and not only a matter of opinion, as I found out by experience very recently.

The machine in question was a fan with a 3-inch pulley which had to be speeded to 2,000 revolutions per minute. It had to be direct driven from the main shaft, which runs at 250 revolutions per minute, so I fixed a 32 inch pulley on main shaft ($\frac{250 \times 32}{4} = 2{,}000$), and ran a twist belt to the fan, which has a contact of two-thirds of the pulleys. With a straight belt from a 32 inch pulley to one of only 4 inches in diameter, the contact of the belt with the pulleys would be very much less. On the larger pulley it would be 66 inches with a twist belt and 50 inches with a straight belt, while on the smaller pulley the difference would be a 7 inch contact with a twist belt and 4 inches with a straight belt.

So never mind what people say against the twist or the straight belt. Let the existing conditions of things be your guide—they speak plain enough to those who use their eyes and their judgment.

Japanese Hardwoods

It is authoritatively stated in Yokohama that the exportation of hardwood logs and railway sleepers from Hokkaido, Japan, which was inaugurated in 1896, has attained a rank next to fisheries and agriculture in industrial importance. The shipment of oak logs from that port began in 1901, the total annual export during the years since varying from 300,000 feet to 600,000 feet board measure, furniture manufacturers on the Pacific Coast being the most ready buyers. The first shipment of oak railway sleepers was sent to Mexico in 1906. Pine and mixed hardwood logs were sent to Australia that year. Oak logs and lumber for the use of furniture and railway car manufacturers were exported to Europe in 1907, in which year exportations of logs increased to 4,000,000 feet. On account of the high prices for fir lumber caused by the demand for building material in San Francisco, the number of feet of ties increased to 46,000,000. At present the supply is smaller than the demand, exporters frequently being unable to secure steamers for this trade. The tendency is toward a 10 to 15 per cent. increase in prices.

Circular Saws

It requires less power to drive a saw through the log when the circumference of the saw is just great enough to allow it to cut through than when the saw is considerably larger, the number of teeth, speed and thickness being equal. With equal speed, thickness and feed, a saw with a large number of teeth requires more power than a saw with larger teeth of fewer number. This is only efficient up to a certain point, at which a small number of teeth will not take the place of the finer teeth. The thinner the saw, the more teeth will it require to carry an equal amount of feed at each revolution. In this case the power is always sacrificed.

Review of Current Trade Conditions

Ontario.

The lumber trade in most parts of Ontario received a temporary check from the storms which prevailed recently. There were signs of the retail trade opening up, but they did not materialize to any important extent. It is a little too early as yet for the retail trade to show any decided activity. There is no disposition among retailers to buy except for immediate use. In spite of this, however, there is quite a hopeful feeling among the trade and a better spring business is expected, once the demand commences.

Stocks of the upper grades of white pine in the manufacturers' hands have been practically cleaned up. No. 3 cuts and better are almost off the market. The improvement in business which has taken place of late leads to a belief that it will be a long time before there will again be an accumulation of these stocks. The middle grades are maintaining their position and moving fairly well. On the other side of the line there is an optimistic feeling to the trade, though no great activity is noted. The winter has been a pretty hard one and retailers have not been selling as much lumber as usual, which means that the yards at Buffalo and Tonawanda are carrying a more complete stock now than a year ago. Wholesalers, however, report that they see a good trade ahead and that there is nothing to feel apprehensive about.

White pine mill culls continue to strengthen. The trade of the country, generally, is good, and this means that a large amount of lumber is being made into boxes. Northern Ontario box makers are turning their atention again to white pine as a box material, in the place of the substitutes which they turned to a few years ago, when white pine mill culls became very high in price. A representative of a prominent manufacturing firm states that 20 per cent. more of mill culls were used in 1910 than in 1909, and that during 1911 it is probable that from 30 to 35 per cent. more will be used than in 1910; in other words, that from 50 to 55 per cent. more mill culls will be used in 1911 than in 1909. Box makers are reported by this authority to be very busy at the present time laying in stocks of mill culls, which they expect will be needed for the trade in the northern States during the coming season. It is reported further, that the bulk of the mill culls at Duluth are already contracted for at prices considerably in advance of those of a year ago.

The lath situation continues strong, and shingles also are in good demand. Spruce is acting in sympathy with pine mill culls. Hemlock is in fair demand and steady. Stocks continue to decrease steadily. A scarcity is reported in 2-inch No. 2 in all lengths and widths, and in all widths, 16 feet and longer of 2-inch No. 1. Hemlock stock boards, 8-inch and wider, are also reported to be scarce. A favorable winter has been experienced so far, at Georgian Bay points for the cutting and taking out of logs. The probabilities are that the quantity taken out will be a little greater than last winter.

Eastern Canada.

Trade conditions in eastern Canada are rather at a doubtful stage, although there is a feeling throughout the trade that a gradual improvement is due. This is based upon the revival in general trade which has commenced and which is making itself felt slowly but surely. The result of last year's operations, in general, have been to leave manufacturers, dealers and exporters in a fairly satisfactory position for taking advantage of any improvement which may develop. Prices for next season's contracts for old country shipments have not yet been made, but there seems to be little doubt that they must at least be as good as, if not better than, they were last year. The United States markets are the only doubtful feature of the situation and no one can foretell at the present stage what the outcome in that country will be. So much depends in the first place upon the reciprocity arrangements, and in the second place it is so difficult to foresee whether, when this matter has been disposed of, some other serious political or trade disturbance will not develop, that it is unsafe to indulge in prophesying. There is a feeling of some confidence, however, that if the reciprocity measure is disposed of, one way or the other, in the near future, the prospects are good for a better season's trade than has been experienced for several years.

At Montreal, an upward tendency in prices is expected this spring. The market at present is quite firm. Most lines of softwoods are in good demand. This applies as usual mostly to the high grades, the low end still being rather slow. Hemlock and spruce are rather quiet. Hardwoods continue in strong demand. Lath are moving well. Building operations at Montreal are expected to be unusually brisk this year. Already good orders are making their appearance.

There has been a fairly active demand for eastern spruce at Boston, although the heavy snow during the second week of February checked the retail business considerably. A few cargo orders have been placed. Some of the manufacturers have advanced their prices by 50 cents. Manufacturers who recently put the price of frames up to $23 are holding firmly. There is a fair demand for spruce covering boards and prices are somewhat improved. Offerings of dry stock are plentiful at present, but a shortage is not improbable in the near future. There is a limited demand for number two matched boards. The demand for random is light. Hemlock boards at Boston are a little more active. The offerings are fairly plentiful, but a shortage is not unlikely before spring. Eastern hemlock clipped boards are held at $19 to $19.50. There is a more active demand for shingles at Boston and the market is firmer. It is expected that the improvement will continue. Good cedar extras are firm at $3.25 to $3.40. The demand for lath is fair, 1½-inch range from $3.35 to $3.40, and 1⅝-inch from $3.70 to $3.80.

At New York, the market for eastern spruce is quiet. There is a general inclination to wait until the building situation improves. The hemlock situation at New York is also quiet, buyers restricting their orders solely to current wants.

Great Britain.

Considerable improvement in the c.i.f. spruce deal market has occurred during the past month in Great Britain. Consignment arrivals are being sold at better prices than formerly and the demand is quite brisk. Forward contracts are still scarce, so far as the liners are concerned, shippers having confined themselves largely to small consignment parcels, on account of the good demand for this class of trade. The general impression is that if any large quantity or large consignment parcels came forward, the market might weaken slightly, as shippers' agents are said to be selling direct to smaller merchants and overlooking the larger importers. On the spot market, prices have advanced all round and there is a gradual improvement in the demand; the future looks brighter than it has for some time. The consumption has not increased to any great extent, but the trade generally shows a tendency towards improvement. Stocks are reported to be scarcer than is usual at this time of year. This is the result of small shipments by liners.

At London, the spot market still continues somewhat depressed and forward business as a result is dull. Some importers appear to have been doing business without any profit. There is a fair amount of trade, however, in progress for this time of year, and the outlook is described as favorable. This makes it all the more curious that some importers should be content to get along without any profit. The deliveries at London for the week ending February 4th amounted to 3,809 standards, as compared with 3,364 during the corresponding week of last year.

Messrs. Churchill & Sim at their recent auction sale, had an excellent attendance. Quite a number of country buyers put in an appearance. The only sale of Canadian wood goods was some first Montreal broad pine, which went at £36.15s., and some 3 by 11 2nd regulars, which sold at £24.10s. and £24.

The Board of Trade statistics published during the week ending February 11th, showed continued expansion of business throughout the country. This was particularly noticeable in the great manufacturing centres of Lancashire and Yorkshire, which are large wood consuming districts. Considerable complaint has been voiced at Liverpool about the policy of St. John and Halifax shippers in feeding that market with small consignments only, but importers are now beginning to realize that stocks in Canada are pretty well cleared out and that further shipments will be scarce until new stock commences to arrive. It is yet too early for contract business for next season's shipping to west coast ports, as freight rates have not yet been quoted. Stocks of Canadian pine deals at Liverpool and, in fact, at every port in the United Kingdom, are being firmly held because of the high prices demanded by Ottawa manufacturers. Quebec c.i.f. values are very firm, particularly for the better qualities. Spot prices are in sympathy with the c.i.f. market. Prices of the better qualities are being advanced. Unsorted thirds are moving slowly but surely. The c.i.f. market for birch is very firm and shows an inclination to stiffen. Offerings are scarce, especially of planks, and the demand is very strong. Spot prices for birch are firm and the demand is good. Stocks are getting very low.

Trade reports from Manchester show very little improvement during the past fortnight. Prices, however, are well maintained and those who have stocks of spruce are holding them for an improvement. Dock stocks are reduced and in many of the sizes they are hard to obtain. Latest quotations are as follows, ex stock: 16-ft. and up, 11 by 3-inch, £11.15s. per standard; average lengths of 7 and 8 by 3-inch, £9 per standard. There is a scarcity of 6 by 3-inch, and town merchants are obliged to cut 7 by 3-inch instead. 6 by 3-inch are worth £8.10s. to £9, according to length. Battens are scarce, especially in the building lengths, the demand at present is light and prices are firm at £9. Floorings are reported to have sold extensively during the early part of the present year and shippers are asking higher prices.

United States.

An increasing number of orders is reported for spring trade at Chicago. The spring demand, in fact, received quite an impetus during the third week of February. Country buying is still rather small, but this

E. C. Barre, Assistant Manager

is to be expected at this time of year. Retailers who have not already made their purchases for spring supplies are showing a tendency to come in to the market, and as they have now learned that the market is decidedly strong, they are showing no hesitation about ordering stock which they think will be in demand through the spring. The belief is practically unanimous that present values will hold for several months. The only thing that could prevent a continuation of the prices now in force would be overproduction. The receipts of lumber at Chicago for the week ending February 11th amounted to 34,125,000 feet, against 29,047,000 feet for the corresponding week in 1910. The total receipts from January 1st to February 11th aggregated 186,785,000 feet, which is a decrease of 5,569,000 feet under the receipts for the corresponding period in 1910.

The market for northern pine at Chicago does not show any important improvement as compared with the previous week or two. Prices, however, are quite strong and business is fair. There is a scarcity of No. 4 stock. In the hardwood markets at Chicago, dry stocks have been decreasing steadily. It is estimated that by the time the winter's cut is ready for delivery, local and outside stock will have become exhausted and the prices will have advanced. Birch and maple are rather scarce, with an excellent demand and steady prices. Basswood is rather quieter. Elm is steady. Manufacturers of hardwood flooring report an improvement in business. Hemlock prices at Chicago have advanced of late and northern shippers report that they are being well maintained. Mill stocks are reported to be badly broken. Yard dealers say that there is a good prospect for a strong demand in the spring and, in fact, that the outlook is promising for the entire season. Some improvement is noted in the demand for west coast products, as the railroads are sending out enquiries and will surely be in the market before long. There is a good movement of spruce yard stock at firm prices. The southern pine situation at Chicago is more encouraging and the spring demand is improving. The February trade was not very heavy, but March trade promises to be much better. Yellow pine mill representatives report that they have plenty of orders. The recent price advances have been fairly held and line yards are commencing to appear in the market. The demand for red cedar shingles at Chicago is still dull, white cedars are moving fairly well at steady prices. Lath continues strong.

At Buffalo, trade has been at about an average for this time of year and prices fairly satisfactory. The building demand, however, is small, on account of the bad weather. There has been a slight improvement in the price of low grades. Box lumber also has shown some improvement. The hardwood trade at Buffalo was a little better during February than during January, although there has not been any great amount of buying for spring delivery. The furniture factories are increasing their demand. Oak is firm, particularly plain oak, and prices are steady. Birch and maple continue to be in good demand and scarce. Hemlock prices at Buffalo are low and the buyers are showing very little inclination to lay in stocks. There is a fair activity in yellow pine at Buffalo, although building is rather quiet. Prices are being well maintained and are expected to continue at a fairly satisfactory level. The trade in shingles at Buffalo continues quiet, but prices are fairly firm and the stocks are light.

Market Correspondence

Better Tendency to Montreal Prices

Montreal, Feb. 23.—Several lumbermen interviewed on the local lumber situation agree that prices this spring will have a tendency to increase. The present market is quite firm and there is a strong demand for most lines of soft woods, especially pine. The low end are still regarded as a drug on the market. Hemlock is in poor demand, cull spruce is down, but in general, spruce is not expected to change much in price. As for hardwoods, birch and maple are finding a ready market. It is believed that more hardwood has been cut than usual this winter; nevertheless prices are soaring. Lath are in good demand and prices are high. Owing to the extensive building operations that will open up in the spring, dealers are receiving many inquiries and making fairly good bookings. Still trade will not be brisk for a month or six weeks to come.

There has been rather too much snow for convenient working in the woods, but it is reported that the logs have been pretty well hauled out ready for rafting as soon as the river is open. The owners of timber limits are reported to have employed about the same number of men as usual and it is concluded that the general cut of pulpwood and rough timber will run about the average.

Inquiries as to quotations brought out the remark in all quarters that no settled prices could be quoted until it was known what Parliament would do with the reciprocity bill. It is the unanimous opinion that the lumber trade would benefit by the adoption of the proposed tariff. One large dealer, however, expressed doubt as to whether the ultimate result would be beneficial to the trade. Owners of timber limits, it is anticipated, will endeavor to reap as much profit as possible from the new conditions and retailers expect to have a hard fight to bring prices down even with the reduced tariff; but no one ventures, at this early stage, to anticipate what will be the ultimate outcome.

The whole tone of the lumber industry is regarded here as more optimistic than last year, at this time, though it cannot be denied that the reciprocity agitation has already disturbed the market and affected the situation.

Liverpool, Eng., Feb. 19.—A slight improvement in the demand for Canadian wood can be observed in the markets of the United Kingdom. The general trade of the country is still expanding and increasing activity is in progress in the leading industries, which require the use of timber, and which accordingly, add to the general demand. It is so in the coal, steel, iron smelting, ship-building, railway-car and waggon building, and in the chemical making industries. All of these use pine timber or oak; largely. House building is not going on actively, but constructional building work of the larger class is in moderately active progress, and is making a very fair demand for timber, especially for pine of the longer, square sorts, and deals, for use in the construction of the lofty derricks which are now used in all building operations of magnitude. The consumption of pit-wood is proceeding actively in the principal mining areas, and an increased demand for deals and other timber for constructional work is being made by the mining industry.

The furniture making industry is in an active state, and a large consumption of walnut, birch, mahogany and yellow pine is in progress among furniture manufacturers. This is one of the steadily growing industries, and is making a continually increasing demand for woods of the kinds named.

Quebec, Montreal and Halifax spruce.—The demand for spruce has been more active and an improved tone prevails in the market. Business has not been on a large scale, but the freer movement of stocks has made things more cheerful, and holders have assumed a firmer attitude. Timber of exceptional sizes is being held for such prices as may seem to be obtainable. At Liverpool, a fair reduction of stocks has resulted through the later sales, and shipments which have come to hand, have, in some cases, been taken up privately, on c.i.f. terms. At Manchester, the demand has also improved and more confidence prevails in the market. Liner parcels continue to be received at the principal ports, and prevent prices from advancing as otherwise they would. These parcels have not sufficed to prevent a diminution of stocks, and the hardening of prices spoken of, in the case of wood of any special attractiveness. One still hears a free expression of the opinion that Canadian shippers ought to keep back the consignments which they are sending by the liners, and give holders at the chief ports in the United Kingdom a chance to work stocks down, and to get prices up, a little. It seems, however, too much to expect that shippers who have the goods to send forward will do anything of the kind, so long as the steamship companies are only too glad to receive the wood and to carry it across the Atlantic. At present, despite the "liner lots," the spruce market is firmer, and the prospects are more assuring.

Size and price—Of goods which have lately been sold in the London market, may be mentioned some lots of 1st quality Quebec spruce, 3x10/12, which brought £15.5s. per standard, and lots of 2nd quality, 3x7, which sold at £8.15s. Lots of 3rd quality, 3x9, brought £10.5s. Other lots of 3rd quality wood sold at £7 to £7.5s., the sizes in these cases ranging from 2x5/9. In other sales, Quebec wood of 3x11 brought £9.10s., and 3x10, £9. Some lots of 3x5 brought £7.10s., and of 3x4, £7.5s. Lots of 4th quality, 3x5, sold at £6.15s. St. John's spruce of 3x10 brought £8, and of 3x9, £9.5s. Other lots, of 3x6, sold for £7.15s., and of 3x5, for £7. Lots of 3x9 sold at £8.15s. to £6, while lots of 3x8 sold at £5.10s. At Manchester, 3x8 spruce of average lengths has sold at £9. At Liverpool, St. John's and Miramichi spruce is quoted at £8.7s.6. to £8.12s.6d.; Nova Scotia at £8 to £8.5s., and spruce boards, at £7.5s. to £7.10s. per standard, at the time of writing.

Flooring boards are viewed as one of the safest classes of goods, as regards selling. There is always a fairly large demand for them—at a price. At present, the price in the London market is considered to be low. Freidrikstadt, yellow, unassorted, ⅞-in. x 6-ft., have sold at 9s. per square. Norwegian floorings have sold with some freedom and importers seem inclined to advance the price. Offers have been made of ⅞x6-inch boards at £9.10s. c.i.f.; and some sales have been carried through at the price, or at a slightly less price. In other sizes, boards 1-inch x 5 inches, of 1st quality, have brought £10.3s per standard. Lots of 1x7 have sold for £11.6s. Lots of ⅞x5 have sold at £8.9s., and other lots as low as £5.8s. In one case, a cargo of boards, chiefly of 6 inches, brought £12.5s., and in another cose, the even £12 was paid.

Pine has improved it's position, and stocks can not be described as heavy. Recent sales at London have comprised wood of 3x12/18 of 1st quality, which brought £27.5s., of 3x⅞, which brought £23.5s., and of 2nd quality, 3x11, which brought £22.5s., and 3x9/10, which brought £22.10s. Third quality, 3x10, has sold for £14.5s., 3x8, for £13.5s., and 3x7 for £13. Fourth quality pine, 3x11, has sold for £10.15s., and 3x7, at £8.10s. At Liverpool, Quebec pine of 1st quality is quoted from £25.10s. upward; 2nd quality, from £16.16s. upwards, and 3rd quality

TALK No. 3.

Prejudice Beaten

We cannot do better in Talk 3 than print a remarkable testimonial to the merit of our

"AMPHIBIA" PLANER WATER PROOF BELT

An extract from the letter runs: "Will say that we are very much pleased with belts you furnished us, although the writer being rather doubtful at the time, and of course prejudiced against Canadian belts, was agreeably surprised. The waterproof belts (including an "Amphibia" Planer) have proved to be strictly waterproof and entirely satisfactory. There appears to be practically no stretch at all in them. In fact all of your belts have proved to be the best belts the writer has ever had any experience with, and will be glad to testify to their merit at any time we are called upon to do so."

That is the kind of letter to make a merchant justifiably proud of his goods.

A planer requires a belt made specially for the work.

On account of very high speed it must be perfectly even in thickness and made from dead centre stock to insure straight runniug on small pullies.

Where green lumber is worked or the belt is liable to encounter dampness, it must be waterproof.

"AMPHIBIA" PLANER meets all these requirements. It is made in two weights, Heavy Single and Double.

from £13.10s. upwards. At this port, the stocks are now in a moderate compass, and holders are very firm in quoting for particular lots.

Birch is in a strong position. The market is practically bare, as regards logs, and planks have been in short supply. Quebec birch is quoted at 1s.6d. to 2s.4d. per cubic foot; and St. John's, at 1s. 6d. to 2s. Planks are quoted at 9d. to 11d., but sellers at present have a distinct advantage through the absence or lightness of stocks.

Oak has been in fair demand for furniture, and railway carriage building purposes. Stocks are not unduly large but are ample for the present consumption.

U. S. Trade Conditions During 1910

At the recent meeting of the Northern Pine Manufacturers' at Minneapolis, the secretary, in the course of his annual address, gave the following interesting trade review:

The year 1910 did not bring the anticipated volume of business and improvement in prices generally predicted at the beginning of the year. The production and sales of yellow pine in the south have been greater than in previous years, but prices have fluctuated in much the same manner as in 1909. From the comparative statement of cut and shipments for 1909 and 1910, compiled by Geo. K. Smith, secretary of the Yellow Pine Manufacturers' Association, we learn that for the eleven months of 1909 the cut of 218 mills was

months of 1909 the cut of 218 mills was	3,562,339,421 feet
The shipments were	3,497,835,827 feet
Cut more than shipped	64,503,594 feet
In 1910, 218 mills cut	3,921,390,090 feet
These shipments were	3,862,286,218 feet
Cut more than shipped	59,103,872 feet

The cut and shipments in 1910 were both greater than in 1909 and the excess cut over shipments was slightly greater in 1909 than in 1910.

Secretary A. W. Cooper, of the Western Pine Manufacturers' Association, reports the cut and shipments of the Inland Empire, so far as could be ascertained, for the first eleven months of 1909 and 1910 as follows:

	1909	1910	More 1910
Cut	717,053,676	841,558,796	124,505,120
Shipments	767,465,033	780,870,942	13,405,909

An increase of 17.36 per cent. in cut and 1.75 per cent. in shipments.

On the Pacific coast there is undoubtedly a considerable falling off in both production and shipments, as many saw mills are not sawing and prices have not been all that was desired.

Hemlock manufacturers for the last three years have experienced as unfavorable a market as any of the manufacturers of lumber in the building line. The present condition of the hemlock market is described in the bulletin of the Hemlock and Hardwood Manufacturers' Association of January 6, by President W. C. Landon, whom we quote, as follows:

"So far as the lumber supply is concerned, especially in stock held by manufacturers of hardwood and hemlock, it is very evident that the stocks on hand are materially less than they were a year ago. This is especially true of low grade stock and, while I am pleased to note that condition, I regret very much that it has been necessary to take decidedly low prices in order to reduce stocks to the amount now on hand.

"Low grade stock has been selling, during the past four months, at a lower average than at any time since the fall of 1907. I believe, however, that this condition is at an end, because, with the reduced amount of low grade stock held by the manufacturers, there is already a feeling that this class of stock is going to bring more money, and as a matter of fact, it is at the present time bringing a higher average price than has prevailed for some months past."

In our own territory the production of 1910 was curtailed by the want of logs to keep our saw mills running during the extremely dry season when the water in many of the streams was so low that logs could not float. Had it not been for this inability to obtain logs for many of the mills, our production would probably have exceeded that of 1909.

Our monthly reports from manufacturers show a falling off in both production and shipments in 1910, compared with 1909, as indicated by our December report giving the production and shipments of each month for both years.

The shipments for 1910 in the months of March, April, May, June, October and December were greater than in the corresponding months of 1909; while those of January, February, August, September and November were less.

Prices of northern white pine have remained about the same the whole of the year. Lists issued in April are still quoted, and with the exception of a very recent slight raise on a few items, there is little variation from those lists at the present time. No. 2 and better and dimension have been ready sellers all the year and demand for low grades has improved steadily.

Our Annual Stock Sheet for January 1, 1911, gives: 173,149,451 feet, or 15½ per cent. less lumber than was on hand a year ago.

Inch Shop, D & Better, C & Better, Norway and Mill Run, Inch, are the only items that show an increase, and the increase is light. Dimension is 7½ per cent. less, No. 3 boards, 29½ per cent. less; No. 4 boards, 36½ per cent. less; No. 5 boards, 11½ per cent. less, and lath, 25½ per cent. less than January 1, 1910.

The marked reduction in the stocks of No. 3 and No. 4 boards and strips is in favorable contrast with the surplus stocks of these items that have accumulated and dragged along for the last three years.

Prices of yellow pine have advanced recently and there seems no good reason why there should not be a general, moderate advance in lumber, provided the excessive capacity of the saw mills is kept within reasonable limits.

Coperage Outlook not very Bright

The Sutherland-Innes Company, Chatham, Ont., referring to the cooperage business reports as follows: The winter, for logging, has so far been very unsatisfactory and very little has been done. While we had a couple of weeks' sleighing in December throughout the northern States and Ontario, it came so suddenly that very little hauling was done. In February there was a bad break-up and the thaw was general. At the time of writing, the woods are impassible in most of the northern parts of this province, and unless a hard freeze-up comes very soon, the crop of logs is going to be shorter than it has been for years, the consequence is, that prices are stiffening considerably, and manufacturers are disinclined to quote on future business until they know where their supplies of raw material are coming from.

Consumers are now willing to place contracts for the year, and, while a considerable number of contracts have already been placed on the basis of last year's prices, manufacturers are now asking 5 per cent. higher on the business which is now offered.

The trade throughout the winter months has been considerably above normal; no doubt this has been caused to a great extent by the general improvement in trade, and the increase in population, and also in the industries which have started using barrels.

The outlook at the present time, as far as the production of stock is concerned, is not very bright looking for the manufacturers. Unless conditions change and the winter runs well into March, the output will be the lightest in the northern part of the country for years.

An Opening for Box Lumber in England

The Department of Trade and Commerce in its weekly report draws attention to the English demand for boxes required for packing tin plates. This "trade is reported to be in a flourishing condition, and the prospects highly encouraging for a long time to come. The only foreign wood imported for tin plate box making is birch, and this class of timber is still very scarce, and will be so during the next year. The price of birch is rapidly advancing."

The following prices are stated to be those now obtained by the Welsh makers of these boxes. The quantity required being about 350,000 weekly:—

For 20½ x 14¼ x 1¾, 3½d.
For 20½ x 14½ x 1½, 3½d.
For 19¼ x 14½ x 1½, 3½d.
For 19¾ x 14½ x 1¾, 3½d.
For 28½ x 20½ x 1¾, 7 d.
For 28½ x 20½ x 1½, 6¾d.
All less 2½ per cent.
For 28½ x 20½ x 1¼, 6½d.
For 28½ x 20½ x 1 , 6½d.
For 20½ x 10½ x 3¼, 4 d.
For 30½ x 21½ x 1¾, 9 d.
For 30½ x 21½ x 1½, 8½d.
For odd sizes, 4d. basis.

Forest Products Exports Show Slight Increase

Exports of forest products from Canada during the calendar year of 1910 amounted in value to $46,980,289. In 1909 the total was $46,716,480; in 1908, $38,504,738, and in 1907, $45,285,118. The exports of forest products in 1910 were only exceeded by those of agricultural products, $86,884,869, and animal produce, $52,674,344. Exports of mining products totalled in value $42,239,342.

Exports of wood and manufactures of wood for the nine months ending with December, 1910, amounted in value to $44,916,433, against $44,975,076 during the corresponding period of 1909.

The following table shows the exports of the principal articles of wood and manufactures of wood during the nine months period:

Exports of wood and Manufactures of wood.	Nine Months Ending December.			
		1910.		
	1909.	Total.	To United Kingdom.	To United States.
Logs	725,136	944,390	22,748	917,553

EDGINGS

Ontario

The George Thomson Lumber Company, Limited, Toronto, has been incorporated with capital of $100,000. The incorporators are: George Thomson, Goderich, lumber dealer, and F. Thomson, Southampton, lumber dealer.

George Rathbone, Limited, Toronto, capital $200,000, have been incorporated to manufacture and deal in saw logs, shingles, etc. The incorporators are G. Rathbone, manufacturer; T. E. Rathbone, and C. Marshall, all of Toronto.

Recent developments in connection with the business of the Dryden Timber & Power Company, of Dryden, Ont., lead to a probability that the company will materially increase the capacity of the pulp mill and abandon the idea of doubling the capacity of the sawmill.

Tenders are now being called for the buildings of the Spanish River Pulp & Paper Company, at Espanola, Ont. The machinery has already been ordered from various firms in Canada, and the United States. The whole plant will be under one roof, and the building will be about 525 feet long.

Berth No. 90, on the Whitefish River in the District of Algoma, Ont., has been sold by Patrick McDermitt to the Little Current Lumber Company, of Bay City, Mich. The sale includes all the white pine, Norway and spruce. The majority of the stand is white pine. The timber is of medium size and is estimated at between 15,000,000 and 20,000,000 feet.

It is rported that the Minesota & Ontario Power Company intend to convert the five undeveloped units in their Canadian power house into a pulp mill. A number of men are already employed installing three grinders for each unit, which will make a total of 15 grinders. The pulp produced, it is said, will be exported to the company's paper mill at International Falls, across the border.

A bill has been introduced into the Ontario Legislature by Hon. Mr. Matheson, Provincial Treasurer, authorizing the raising of a loan, not to exceed $500,000, for the purpose of purchasing the rights of the Munn Lumber Company in Algonquin Park, and for other expenses incidental thereto. The loan is to be for a period not exceeding 40 years at a rate not to exceed 4 per cent. per annum.

Berth No. 188 on the Mississaga river, in the dtsirict of Algoma, Ont., has been sold by the Northern Timber Company to Eddy Brothers & Company, of Bay City, Mich. The berth consists of 36 square miles and is reported to contain about 50,000,000 feet of white pine of good quality. The purchase price is reported to have been in the neighborhood of $300,000. Eddy Brothers & Company own a number of other limits adjoining berth No. 188.

Reports from Fort William indicate that there is danger of an outbreak of smallpox in New Ontario this spring. There are now five cases in quarantine at the Queen's Hotel, Chapleau, which is 385 miles east of Fort William on the C.P.R. The original case is reported to have come from one of the lumber camps near North Bay and considerable fear is felt that when the camps break up in the spring the returning lumber jacks may cause an outbreak of the disease.

The assets of the Belding Lumber Company, Limited, Toronto, are being sold by tender, by G. T. Clarkson, 33 Scott street, Toronto. The assets are as follows: lumber, $16,329; machinery, $8,350; chattels, $1,588; furniture, $102; supplies, $73, which, after deducting a lien of $132, makes a total of $26,311. The purchaser will also assume the lease of the property now occupied, consisting of about three acres, on which are a planing mill and a factory. The tenders were called for to be opened on March 1.

Mr. Galbraith, of the firm of Galbraith & Airth, Chatsworth, Ont., has purchased the interest of Mr. Airth in the planing mill and sawmill at Chatsworth, and has arranged with Messrs. W. Bumstead and W. Arthur to go into the planing mill, sawmill and lumber business in Owen Sound. They have commenced the erection of the planing mill, which will be equipped with the latest and best machinery for the purpose. The firm will be known as Galbraith, Bumstead & Arthur. The main building will be 45 x 108 feet; two storeys with basement; engine and boiler room, 40 x 24 feet; the dry kiln will be 40 feet x 60 feet.

Eastern Canada

Dorais & Sabourin, of St. Laurent, P.Q., have been registered as manufacturers of sashes and doors.

The Shawinigan Pulp & Paper Company have been incorporated under the Quebec Companies' Act, with capital stock of $100,000. The head office of the company is Shawinigan Falls, Que.

Mr. James Hurley has erected a portable mill for sawing lumber at Hurley Brook, N.B., and will later remove the mill to Blissville, Northumberland County, About a million feet of lumber will be manufactured at each place.

Henry D. Morris, of the Miramichi Lumber Company, who recently returned from the scene of the company's operations at Boiestown, reports that the cut this year will slightly exceed that of last year, and that conditions are excellent for getting the lumber out, there being three feet of snow in the woods.

Reports from Anticosti state that the lumber cut on the island during the present winter will amount to upwards of 750,000 logs. Most of this will be turned into pulpwood. Many of the logs are being hauled to the new mill at Ellis Bay over Mr. Menier's new island railway into the interior, and many also are being floated down the different rivers.

The latest development in connection with the affairs of the Nepisiguit Lumber Company, of Bathurst, N.B., has been the appointment by the liquidators, Messrs. Gilbert & McKay, of Mr. P. J. Burns as manager of the concern. This announcement is accompanied with the statement that the mill will be re-operated at the commencement of the season.

Mr. W. J. Scott, of the Scott Lumber Company, Fredericton, N.B., reports that the Victoria mills will be operated this season. The plant has been idle for a couple of years. The Scott Lumber Company are considering offers for the purchase of the Victoria mills and timber lands. Upon the conclusion of one of the several offers, they state that the mill will commence operations.

The Eureka Lumber Company, Limited, of Bathurst, N.B., are applying to the New Brunswick Government for incorporation as a lumber manufacturing and selling company. The capital stock of the company is to be $80,000. The provisional directors are: J. D. Walker, Burnsville, N.B.; G. M. Goding, Auburn, Me.; E. B. Starrett, Auburn, Me., and H. A. Powell, St. John, N.B.

A movement is on foot looking towards the establishment by Chappell Bros., of Sydney, N.S., of a large saw and planing mill in the town of Dalhousie, N.B.

Chappell Bros. recently acquired limits in the county of Bonaventure, Quebec, located across the river from Dalhousie. A public meeting was recently held at Dalhousie to discuss proposed inducements to Chappell Bros. It was decided to take a plebiscite upon the question. The inducements suggested are the following: 1. A free site, including water sufficient for steam purposes and to cost not more than $8,000; 2. Free water and stand pipes for fire protection; 3. Flat rate of town taxation of $5,000 for twenty years; 4. Right of way to the mill site;; 5. The council to move in securing dredging services from the government and other minor privileges in consideration of Chappell Bros. agreeing to erect a long lumber mill capable of sawing from 10,000,000 to 15,000,000 superficial feet yearly, together with a planing mill to give winter employment to the workmen of the town. It is generally expected that the proposal will be carried.

The annual meeting of the Clyde River Pulp & Paper Company, Limited, was held recently at New Glasgow, N.S. The report of the secretary showed a very favorable condition of affairs. The mill has been running about two months and in addition a large quantity of pine lumber has been gotten out. Arch. McKenzie was again elected president and Arch. McColl vice-president. Mr. Graham Fraser's name was added to the board of directors.

A Montreal report states that a $20,000,000 deal is about to be put through in connection with British Columbia timber. Messrs. G. F. Johnson, and H. J. Allison, of the firm of Johnson, McConnell & Allison, of Montreal, are now on their way to England in connection with the proposition. Much of the capital, it is said, has already been subscribed. The name of the company is to be the British-Canadian Lumber Corporation. The head office will be at Montreal.

The fact that Messrs. Shearer, Brown & Wills, Limited, intend shortly to dispose of fifty or sixty thousand feet of land belonging to their extensive yards on St. Patrick street, Montreal, has given rise to the rumor that the company is about to sell out or reorganize. Mr. Andrew Shearer, president of the company, reports that no change is contemplated in the management of the company, but the present seemed to be a favorable time to dispose of some of their superfluous real estate holdings.

A Montreal report states that H. A. Lovett, K.C., and J. N. Greenshields, K.C., have left for Paris, Brussels, and London in connection with the pulp and paper merger scheme, which includes the Wayagamack Pulp & Paper Company, which is bonded for $5,000,000. The purpose of the trip abroad is to bring to a conclusion the negotiations to merge the East Canada Paper & Pulp Company and the Belgo-Canadian Company, into the deal with Wayagamack. It is proposed to capitalize the merger at $15,000,000.

Western Canada

Fire caused a loss of $3,000 recently to the sawmill of the Fernbridge Lumber Company, Limited, New Westminster, B.C.

The B. C. Gazette gives notice of the following incorporations: Western Canadian Lumber & Fuel Company, Limited, capital $150,000; Essex Shingle Company, Limited, capital $10,000.

Hon. W. H. Cushing, of the firm of Cushing Bros., Ltd., Calgary, is reported to have concluded negotiations for the purchase of forty lots of trackage in the city park section of Saskatoon, Sask., at a cash price of $15,000. The property was secured as an industrial site, and it is understood that the firm will erect a large woodworking establishment.

Eighty acres of the townsite of the Canadian Western Lumber Company, at Fraser Mills, B.C., three miles east of New Westminster, are being cleared for subdivision. The area in question will be used for additional piling grounds and for the requirements of the mill employees. Lots will not be offered the general public. The tract is situated east of the company's big sawmill and has a frontage on the Fraser river.

It is expected that the timber cut for the construction of the Alberta Great Waterways Railway, and of which there is $30,000 worth seized for non-payment of $3,500 dues, will be bought up in small sections by private tender. A private bid has been received for the majority of the ties, from persons who, it is expected, will eventually sell the material to the C.N.R. A private bid is also expected for the several thousand telegraph poles, the majority of which are still in good condition. These also may be sold to the C.N.R.

A sale is reported of the upper half of Tilbury Island, near New Westminster, B.C., to a syndicate of English interests. The purchase price is $150,000, of which $50,000 is reported as having been cash. It is further stated that the syndicate will immediately erect a large sawmill on the site, at a cost of $500,000. The mill will give employment to several hundred men. The site has a water frontage of 5,300 feet, and contains 170 acres. There is deep water right at the shore line.

The assignees of the Lake Winnipeg Lumber Company, Limited, the Standard Trusts Company of Winnipeg, are receiving tenders up to March 20 for the purchase of 54¼ square miles of standing timber, on streams adjacent to and tributary to Lake Winnipeg, consisting of the following timber berths: Nos. 815, 856, 1012, 1015, 1134, 1151, and 1037. The sale will also include a sawmill and planing mill at Bad Throat on Lake Winnipeg, a steamer, two barges, store, camp buildings and supplies.

Trade Enquiries

The Dominion Government Trade and Commerce reports contain the following trade enquiries. Readers of the "Canada Lumberman" may obtain the names of enquirers by writing us, enclosing stamped envelope, and stating number of enquiry:

195. Basswood broom handles—A Bristol firm desires to import basswood broom handles.

196. Pine and spruce lumber.—A Bristol firm of timber merchants desires to be put in touch with Canadian exporters of pine and spruce lumber.

197. Cut timber.—A Bristol firm wants to import cut timber for building purposes—interior fittings of houses, floorings, etc.

200. Wood dowels.—A Manchester firm asks for prices and dimensions of wood dowels from Canadian exporters.

204. Oak hubs.—A Manchester firm asks for prices and sizes of oak hubs from Canadian manufacturers.

206. Chair seats.—A Manchester firm wishes to correspond with Canadian manufacturers of chair seats.

209. Broom handles.—A Manchester firm asks for prices of broom handles from Canadian manufacturers.

213. Oak head and staves.—A Manchester firm asks for prices and dimensions of oak heads and staves from Canadian manufacturers.

215. Hay fork handles—A Manchester firm asks for prices and dimensions of hay fork handles from Canadian manufacturers.

217. Box boards.—A Lancashire firm asks for prices and dimensions of box boards from Canadian shippers of same.

Doings of the Hoo-Hoo

The Winnipeg Branch of the Hoo Hoo seized upon the opportunity presented by the presence of the large number of lumbermen in the city to hold a concatenation, which took place at the hall in the Travellers' Building on Friday night. About two hundred were present. The rites of initiation were administered to thirty-five kittens. The festivities and celebrations in connection were of the usual hilarious nature. After the meeting, a supper was partaken of, and an impromtu musical programme and vaudeville permormance carried out. The gathering broke up at the usual early hour.

The following officers were appointed for the occasion: Snark, Wm. B. Stephenson, St. Paul, Minn.; senior Hoo Hoo, J. Hooper; junior Hoo Hoo, Wm. B. Tomlinson; bojum, Geo. Wall; scrivenoter, Herbert Springate; jabberwack, W. K. Chandler; custocation, G. A. Knight; arcanoper, R. F. Bingham; gurdon, D. J. McDonald.

Those initiated were: W. L. Mackenzie, Candahar (Sask.); H. D. Cleveland, Seattle (Wash.); P. L. Priest, Minneapolis (Minn.); W. F. Thom, Yorkton; R. MacDonald, Rouleau; J. T. Pike, Keewatin; Clayton Sherry, Prince Albert; F. A. Roberson, Prince Albert; J. A. Galloway, Lanigan; W. W. Scoville, Rainy River; G. H. Hogarth, Brownlee; H. J. Lindae, Leslie; C. H. Pennock, Vancouver; F. B. Dohan, Regina; J. Hutchison, Cull Lake; H. H. Spicer, Vancouver; W. Rae, Wapella; O. K. McElhinney, Outlook; A. R. McLennan, Abernethy; G. W. Boughton, Edmonton; Theodore Moreson, Moose Jaw; A. N. Winters, Aberdeen; D. W. Chamberlain, Port Arthur; F. W. Bagan, Port Arthur; L. A. Stout, Winnipeg; H. D. Bears, Winnipeg; D. B. Jones, Winnipeg; F. E. Evans, Winnipeg; T. Gibson, Winnipeg; G. F. Newton, Winnipeg; C. C. Hamilton, Winnipeg; B. F. Westfall, Winnipeg.

Concatenation at Moose Jaw.

A concatenation of the Hoo Hoo was held at Moose Jaw on February 2nd. W. W. Davidson, Vice-gerent Snark, presided. The meeting took place in the Elks Hall. Fifty members of the order were present and thirty new "kittens" were initiated to the mysteries of the order. After the initiation ceremonies, a banquet was held at the Moose Jaw Dining Hall. This portion of the programme was thoroughly enjoyable. A fine programme of musical and vaudeville numbers was carried out. The music was furnished by the Allan Clifton orchestra and the vaudeville by performers from the Bijou theatre.

The officers for the evening consisted of the following; Snark, W. W. Davidson; bojou, Fred Hamilton; senior Hoo-Hoo, C. A. Baker; junior Hoo Hoo, Lou Palmatier; scrivenoter, M. McFee; jabberwock, Dr. Cooke; custocation, Lou Delamater; arcanoper, Fred Baker; gurdon, Jimmy Singular.

Best Location for a Retail Yard

When taking the best location for a retail yard into consideration local conditions enter which may upset principles and plans, but the following salient points will, nine cases in ten, fit in with the average town.

The retail yard is like an ordinary store in that it caters to the public at large and not as a wholesaler to a distinct class of customers; therefore it behooves the retailer to keep his wares as much as possible in the public eye. There are several ways in which this can be accomplished, chief of which is (1) prominent location of yard; (2) advertising; and, of course, back up the advertising with service. They are both expensive, so probably one will have to be eliminated.

It is best to sacrifice the prominent location, which means high ground rent and probable increased cost of insurance, for while a yard may (and should) be kept as neat as a new pin the goods offered for sale can not be displayed as in an ordinary store, and it will be found that the increased cost of location will not be offset by the advertising so obtained. The cheapest and most beneficial results, therefore, are obtained by judicious advertising and a location where rent is less. Advertising will bring the buyer if your yard is the last place in town, but in order to keep the buyer other things must be taken into consideration. You advertise good values and service, therefore, the cost of that service to you in order to show up your profit and loss account right must enter into your plans.

The handling of your lumber from car to yard and ultimate distribution to seller cover a large part of your cost, and thereon also largely depends the quality of your service. If you have to haul by wagon from car to yard it either means the maintenance of more teams than are needed for the delivery of your sales or—worse in the long run—poor service. By locating on a railroad track you have eliminated the uncertain expense of hauling from that end and have the cost on a fixed basis of switching and unloading.

To sum up, the best location for a retail lumber yard is a site where ground is at least comparatively cheap, with a railroad spur available. Advertising will offset the location and the facilities and economy will enable the advertising to make good.—C. H. Ketridge.

Wire Rope

We manufacture and carry a complete stock of wire rope for all requirements.

Alligator Ropes—Haulage Ropes—Ballast and Wrecking Ropes
Wire Rope Fittings of all Descriptions
Blocks — Clips — Thimbles — Shackles, Etc.

The Dominion WIRE ROPE Co., Limited
MONTREAL

Jeffrey Log Haul-Ups

are built in lengths and capacities to suit requirements.

We make many different styles of chains for this class of work.

We design, build and install Conveying Systems for handling lumber, slabs, refuse, sawdust, etc.

No Other Ready Roofing Could Withstand this Test

The flame of a powerful blowtorch was placed within two inches of J-M Asbestos Roofing. At the end of fifty minutes (note clock) the roofing was not burned or injured, being only slightly blackened by smoke.

This is one of a number of tests that prove conclusively that the only permanently durable prepared roofing—the one that better than any other resists fire, acids, gases, rot, rust and wear —is

J-M ASBESTOS ROOFING

Other ready roofings are made of wool felt, rag stock, paper, shoddy, coal tar, and other highly inflammable materials which are an actual menace to a building instead of a protection. J-M Asbestos is the "cheapest-per-year" roofing because it requires no coating or painting to preserve it. The first cost is the only expense.

Fire-proof construction is better fire protection to a building than any amount of fire insurance. By covering buildings with J-M Asbestos Roofing it will protect them from fire at no extra cost.

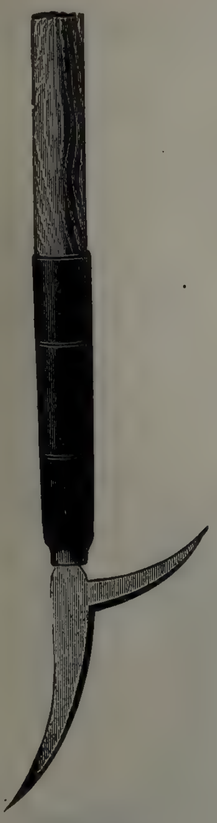
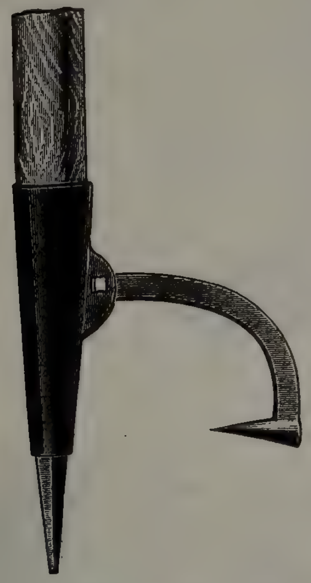
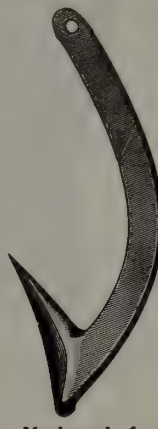
The Soo Line Lumbering Tools are lightest, strongest and best made in Canada

Also Peavies and Improved Soo Line Loading Blocks

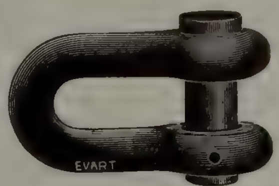


Pike Poles

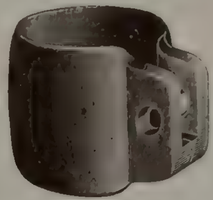




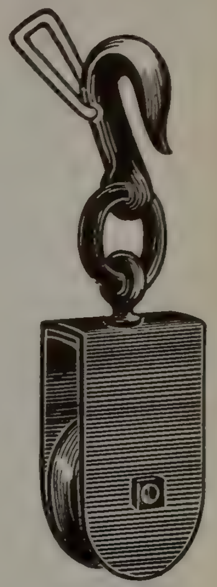
Hooks only for Cant Hooks and Peavies in all sizes and styles



Boom Shackles



Cant Hook Clasps



Loading Block

Cant Hook Clasps, made of mild steel or Swedes Iron, forged with heavy jaw. The strongest and lightest band on the market.

Boom Shackles, made of mild steel with round pin or of Swedes Iron with oval pin, holes drilled through pin and shackles so you can use an ordinary wire nail for key, driving the pin out cuts the nail. All pins are interchangeable. We carry a stock of these n the following sizes, ¾ in., ⅞ in., 1 in., 1⅛ in., 1¼ in.

Our Duckbill Michigan Pattern Hook is considered by the leading lumbermen one of the best patterns on the market.

Peavies, with steel or malleable sockets, with round and duckbill hooks. Maple, Elm or Hickory Handles. All sizes and lengths. Everything which is good and practical in the line of Peavies and Cant Dogs you can get from us.

Pike Poles, with select Maple Handles in lengths 10 to 16 feet. With select second growth White Ash handles, lengths 10, 12, 13, 14, 16 and 18 feet. The Gaffs are all hand hammered of Crucible Steel. Threaded and screwed in.

Improved "Soo Line" Loading Block, (as per cut above.) This Block has heavy Steel Shell, re-inforced at top with iron billet, through which is riveted swivel, hand forged, of extra heavy swedes iron, also swedes iron link with heavy grab hook, hand ring attached. This hand ring is a practical improvement which every lumberman will appreciate.

Pike Poles **Skidding Tongs** **Saw Wedges** **Hookaroons, etc.** **When ordering from your Jobber, specify "Soo Line" Only**

Complete Outfit Will Be Sent Prepaid On Receipt Of Price $7.50

THE

Standard Automatic Brush

does your painting work in a new way, better, quicker, cheaper, eliminating all waste of paint. An equal flow at all times; thickness of coat can be accurately adjusted. Absolutely clean and fireproof.

THE STANDARD AUTOMATIC SYSTEM

does away with the paint can. It eliminates the dip and is far superior to the spray, but it does rub it in. No air pressure is needed. Will work with any kind of paint. Get next to this method. Made especially for manufacturers of automobiles, automobile bodies and wheels, all kinds of vehicles, carriages, etc. It is most useful for manufacturers of furniture. It will also save a lot of time in painting structural work, such as bridges, elevated roads, etc. House and sign painting can be done effectively and quick.

Wherever duplication of work exists, this device will increase your output and reduce the cost. Buy just one outfit to-day and be convinced. We are sure that we will have to equip your entire plant. Special equipments can be made to suit your purpose.

Complete outfit consisting of a large paint tank, either stationary or movable, with automatic valve and six feet of flexible tubing together with the automatic adjustable brush made of aluminum, costs $7.50, and it is still cheaper than the ordinary brush.

The outfit is also made with a tank to be strapped on the back which will cost $2.50 extra.

Our booklet will tell you why. Write for one to-day. Send in your order. Your outlay will only be once. Apparatus will last a life-time. Let us know to-day what you are manufacturing and we will effect a saving for you.

Jobbers and Dealers wanted everywhere.

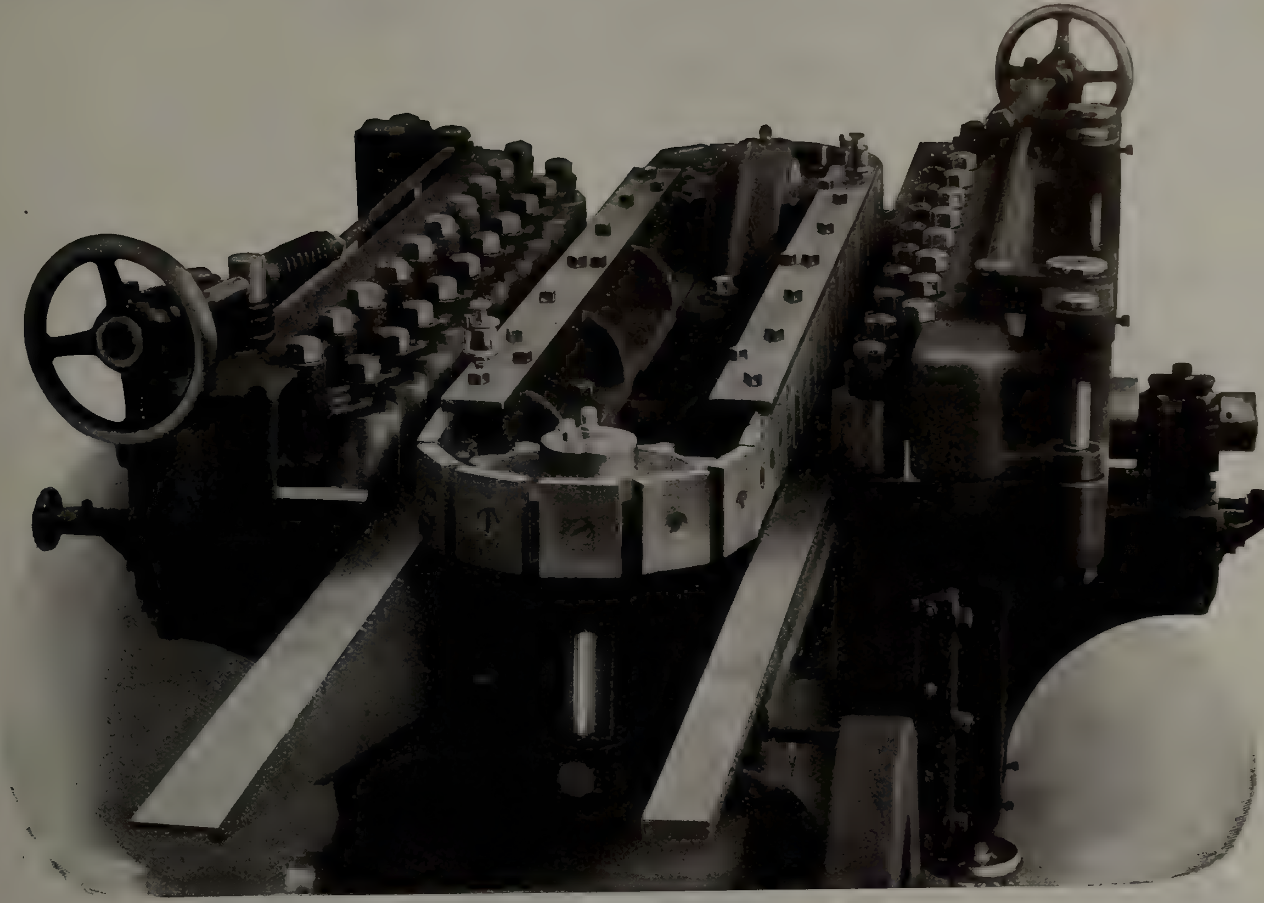
Berlin No. 213 Glue Jointer



Your Conception of a Glue Jointer

There was a time when we didn't make a glue jointing machine.

During a conversation between one of our branch office managers and a furniture man who had bought several of our sanders, the later stated that he had just bought some new machines.

Their conversation follows:

"What did you buy?"

"A couple of glue jointers from So-and-So."

"Do they make a good machine?"

"Oh, as good as any. But, do you know, none of them are what I want. Why don't you people make one."

"Tell me what you expect of it, and perhaps we will."

"Well, I want a machine first, that will handle short stock up to, say, six feet long and handle it four or five times as fast as we can handle it on a hand feed machine. Next, I want a feeding mechanism that will be absolutely positive, that will hold the stock firmly so it cannot slip backwards, jump forward or raise up. Then I want the working parts accessible and some sort of a lever so the machine can be started and stopped instantly from the infeeding end.

"Now, if you will make such a machine and mount it on a one-piece base to prevent vibration, you can have my order for several."

Isn't that **your** idea of what a glue jointer should be?

It describes, with one exception, our No. 213.

The exception is this:

Instead of an output of four or five times as great as a hand-feed machine, our No. 213 has an output **eight times greater.**

The automatic feed makes this possible. It is the one feeding mechanism which provides maximum output yet is absolutely accurate and positive.

Every provision is made for making quick adjustments. A lever at the in-feeding end starts and stops the feed. The cutter-head carriages are adjustable in three directions, providing for perfect alignment with the feeding mechanism.

The four-page folder of the No. 213 goes into detail regarding construction, and contains several pictures. Send for a copy—**to-day**—and learn how to cut your glue-jointing costs.

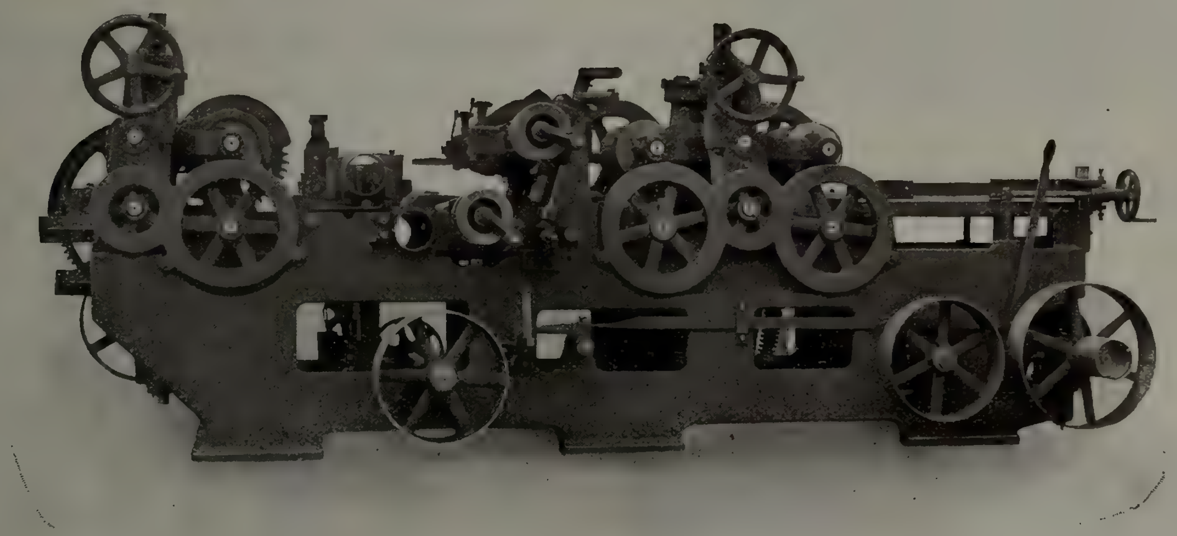
GALT, ONTARIO

This name on your woodworking machinery is a guarantee of quality and represents the best and most modern.



No. 105 Double Cylinder Planer and Matcher

The above cut shows our latest general purpose matcher and challenges comparison with any medium weight machine on the continent. It is very simple and rigid and easy of operation.

NOTE—The guarded gears and the belt drive to feed rolls.

Isn't it Better to Investigate

"The HOWARD" Vulcanizing Process

than to wish you had

Positively the quickest and most economical system known for drying and Preserving Lumber, Railroad Ties, etc.

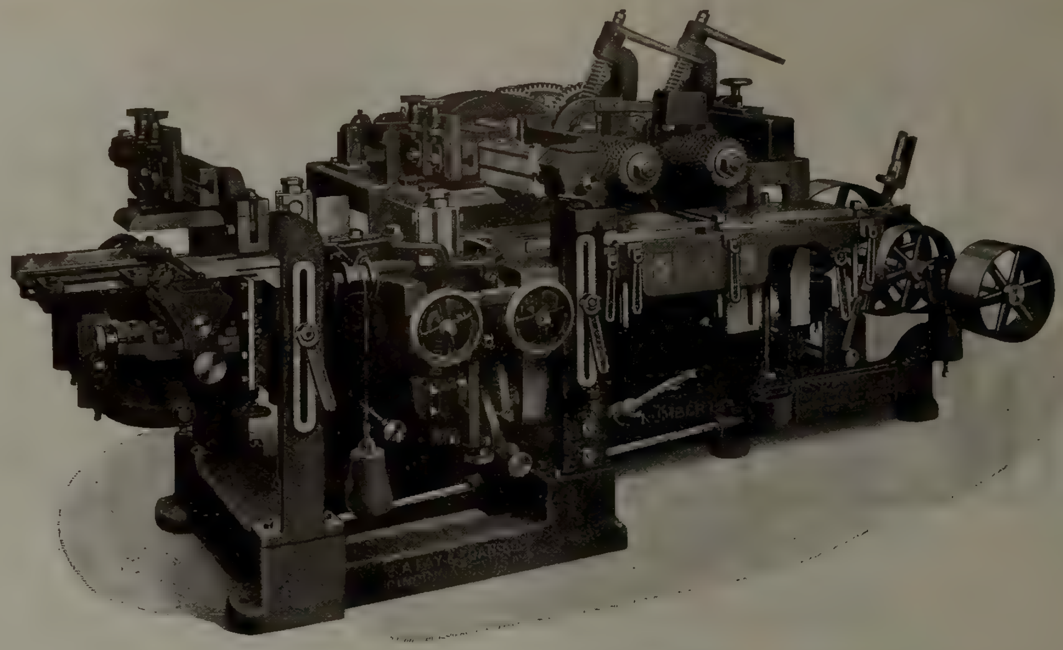
POINTS IN ITS FAVOR:

Does away with all kilns
Improves quality of all lumber
Increases the crushing strength
Increases the transverse strength
Reduces the weight 30 per cent to 45 per cent
It materially prolongs the life of wood
Eliminates shrinking, swelling and warping
Emphasizes and beautifies natural grain of the wood
Makes fit for commercial use woods not otherwise merchantable
Does away with necessity of maintaining heavy stock of lumber in yards
By this process green lumber taken from the log can be used for building purposes in 2 or 3 days

We invite Lumbermen and Owners of Woodworking establishments to see a practical demonstration of the process at our plant in Toronto

Descriptive Booklet on Request

Lumber Vulcanizing Corporation
of Canada, Limited
Executive Offices: McKinnon Building - TORONTO



No. 184 Four-Side Molder.

Notice the extension of the base, forming an outside bearing for the upper head and eliminating overhang of the lower head.

Molder-Value is Measured by the Quality and Quantity of Output

The best results can only be attained by using the best Molder the Market affords—a Molder that is as near perfect as human ingenuity can make it—a Molder that has stood the test.

We have been building Molders for eighty years – you have the reputation and guarantee of the world's largest manufacturers of high duty woodworking machinery back of the assertion that the latest models of Fay & Egan Molders are in advance of any other make now on the market. You also have the verdict of the most discriminating buyers, such as the Otis Elevator Co., Pullman Co., Illinois Central Ry., Sante Fe System, International Harvester Co. and many others, who have bought and still continue to buy our Molders in preference over all others.

LASTLY—our Molder catalog goes into the details of our complete line of high duty Molders—showing that our machines have all the points claimed by other manufacturers, many features exclusive in our machine and that built-in quality that is absolutely necessary in making a good Molder. · This catalog gladly mailed free of charge upon receipt of your request.

Saw Mill Equipment

for

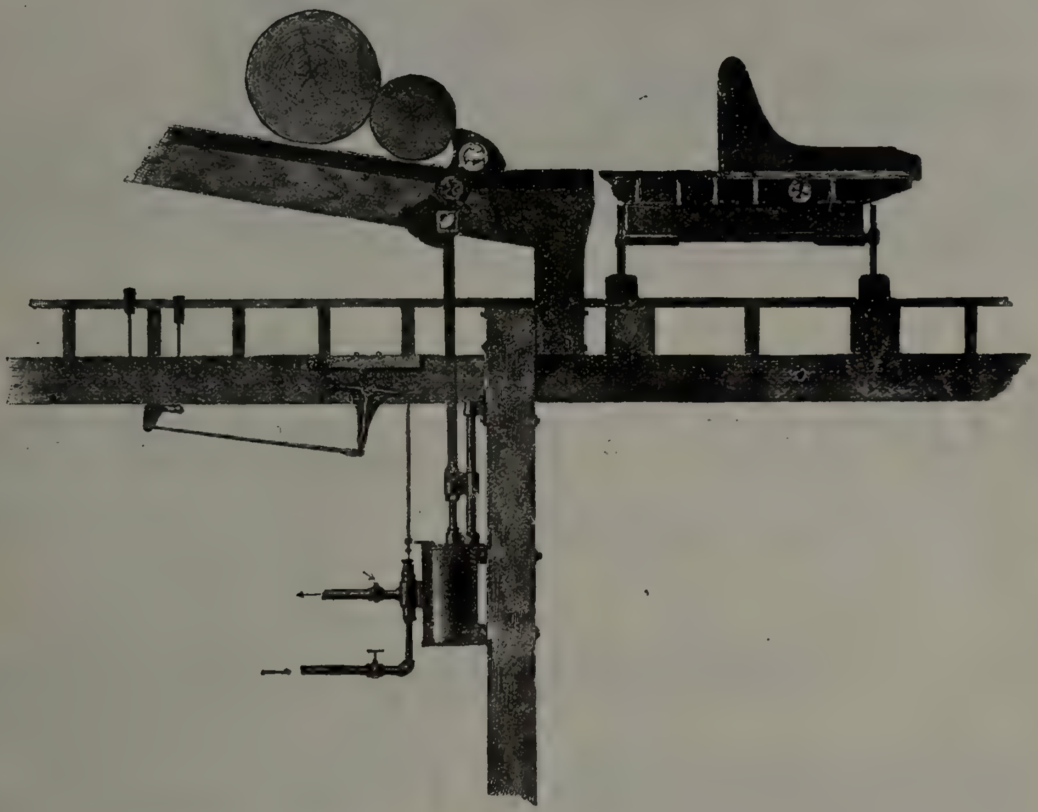
Your Spring Sawing

Log Loaders

Steam Niggers

Log Decks

Live Rolls



Cant Flips

Board Catchers

Steam Feeds

Concave Rolls

LOG LOADER: It always makes half revolution towards the carriage, is very strong and heavy with improved method of fastening the arms. Large cylinder with cross head guide.

LOG DECKS: With larger cylinders than are generally used. Steam Decks with double or single mills. Steel used wherever necessary. Our Log Deck is the one for you.

STEAM NIGGER: The principal improvement in this device over the ordinary steam Nigger, is the single slide steam valve, which is a great saver of steam.

BOARD CATCHER: and Cant Flip combined, catches board, throws cant to gang. No loss of time.

Our literature will tell you more about our up-to-date Saw Mill equipment.

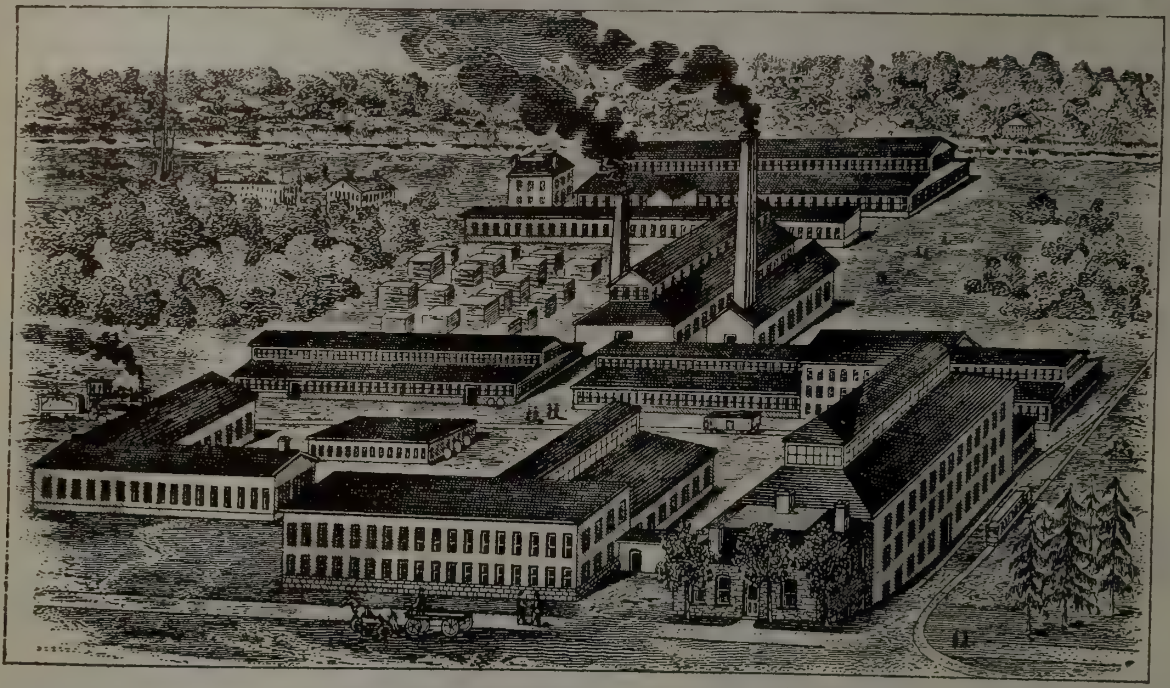
MAPLE LEAF SAWS

The Improved Racer Cross Cut Saw, by Actual Test, is the Fastest and Easiest Cutting Saw Made

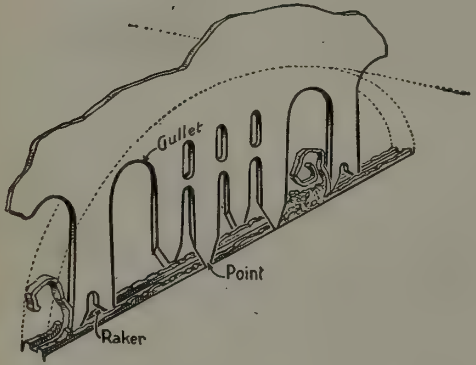


The Maple Leaf saw is higher priced than the ordinary saw because it costs more to make it. It is made of the very highest quality of steel and tempered by a secret process which toughens and refines the steel. The Maple Leaf trade mark on the saw means that it is the equal, if not superior to any saw made. It also means that you are privileged to test it against any other make and if not found equal or superior in quality you can return it and have your money refunded.

The ambition of the manufacturers of the Maple Leaf Saws has always been to produce the best tempered saw in the world and they are constantly investigating and experimenting with this end in view. They have recently made some valuable discoveries in evenness of temper. It has always been difficult to get a perfectly even temper on long and thin sheets of steel, such as saws are made of. Our recent discoveries make this an absolute certainty. Every user of saws should bear in mind that the temper of the saw is its most valuable quality. High finish and attractive appearance amount to nothing if the temper is not right.

All Maple Leaf Saws are Guaranteed to be Perfect in Temper

Shurley-Dietrich Co., Limited Galt, Ontario



Why Atkins Sterling Saws Run Free and Easy

Saws that depend on "set" for clearance have to tear their way through the timber, like the picture to the left. The teeth are sprawled out on either side and chatter and stick and bind and tear. That's why wood sawing is sometimes considered such hard work. That's why commonly ground saws can NOT run fast or pull easy.

ATKINS SEGMENT-GROUND CROSS-CUT SAW BLADES are ground thinnest on the center of the back. The teeth are the widest part, and the blade drops easily into the smooth cut which is made by the saw teeth Very little set makes the teeth cut clean and the rakers clear the center. See the picture to the right. These Saws merely require enough power to pull them back and forth. That's why they run so easily.

ATKINS STERLING CROSS-CUT SAWS are the only Saws that are Segment-Ground, and for this reason are guaranteed to run easier and cut faster than any other Saws. Write us for free information, or order through your jobber or dealer. If they won't supply you, let us know.

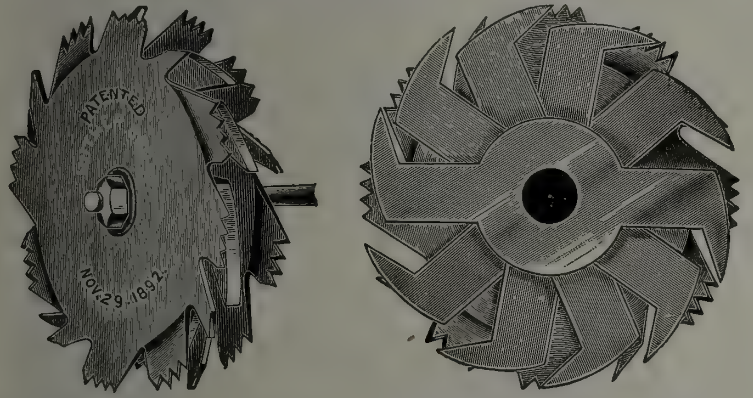
HUTHER BROS. PATENT GROOVER OR DADO HEAD

For cutting any width groove from one quarter inch to 2 inches or ove



Can be used on any Circular Saw Material. Will cut a perfect groove with or across the grain.

This is the only Dado Head on the market that gives entire satisfaction on all classes of work. No screw adjustment. For different width grooves, simply remove or add inside cutters. Sold by builders and dealers of wood working machinery in all parts of the United States. Will send on approval, in competition with any other make on the market; if not the best return at our expense.

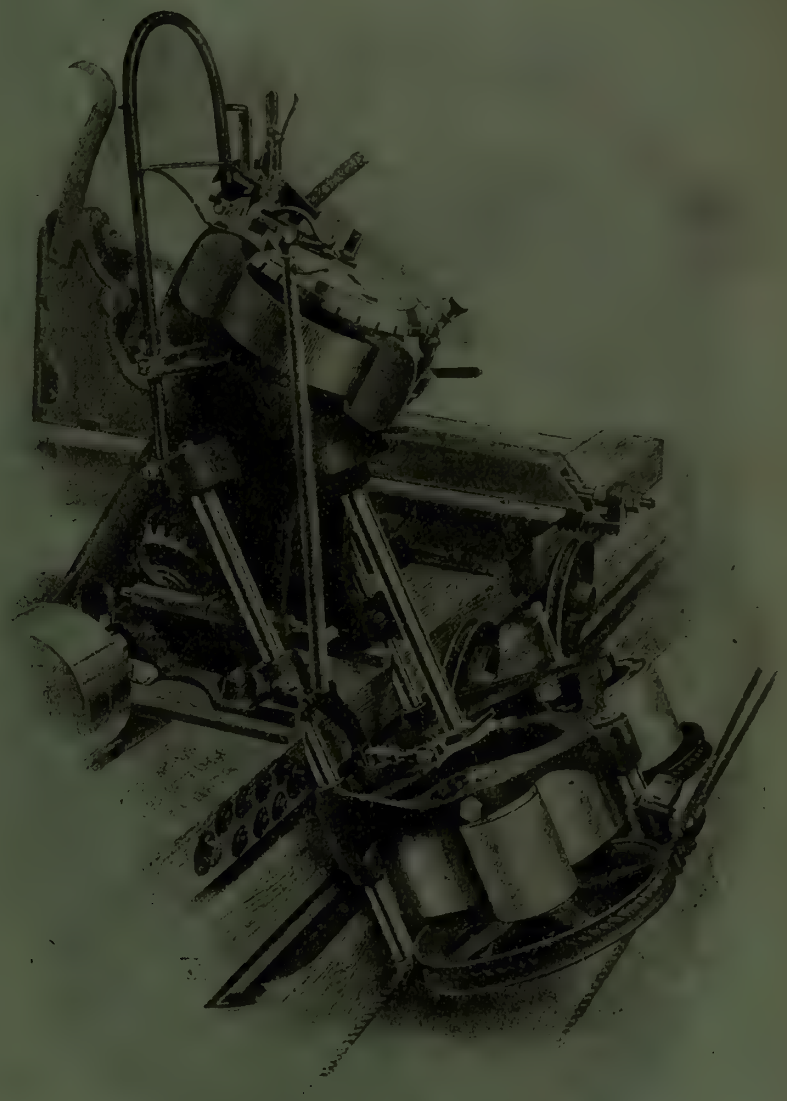
"No Heat - No Work - No Lost Motion"

THE TROUT POWER SETWORKS



Positively the Most Powerful, Accurate and Efficient Setworks Built.

The Trout Power Setworks is rope-driven. It combines a set and receding works in one machine and will turn out more lumber and better lumber than any other setworks on the market.

JUST FOR THESE REASONS:—

¶ There are only two levers to operate.
Setting is accomplished without stooping or bending.
There is no heat from the steam cylinder.

¶ There is nothing to tire the setter.
He can give his undivided attention to the sawyer's signals and cut as much lumber at the end of his shift as at the beginning.

¶ Working parts throughout are of finest selected steel.
The operation is without rack or jar, eliminating any destructive wear.
No lost motion can possibly develop.

¶ The setworks will set by 1-32 inch up to 6 inches at one manipulation of the lever.
The size of the logs does not affect the speed or the accuracy of the set.

¶ Further, the machine is entirely self contained.
It requires no change in the carriage frame.
Can be attached to any size of carriage, Rack or Screw movement.

¶ We are the sole builders of this machine. Perhaps you have seen it at work. If not the best thing to do is to visit us or to write for a fuller description than we can give here.

How Do You Handle Your Small Logs?

We suppose you are interested in any machinery that will help you solve your small log problems. No doubt you have given this matter a good deal of careful thought, since it means so much to you, nowadays, to be able to handle these logs economically.

But, have you ever taken this matter up with us? We have been up against the small log question a great deal, and have met it under many different conditions, so we can probably be of help to you.

For instance you might like to have full particulars about the following machines,

Gangs	All sizes up to 60 in. between stiles, with pressworks operated by hand, friction or steam.
Circular Gangs	With fixed and movable batteries of circular saws. This machine can be arranged so that different thicknesses of lumber can be sawn at the same time.
Combination Gang Edgers	To handle cants up to 8 inches thick, and edge your boards at the same time.
Gang Bolter	A very heavy lath bolter, that will take in cants six inches thick. It has been found to be a very useful machine in many mills.
Structural Steel Band Mill	A light, strong, mill with a structural steel frame, 6 foot wheels, that carries a 16 to 18 guage saw, and that will do any work any 6 foot band mill will do. The price of this mill will interest you.

Shall we send some of our catalogues?

Disston Circular Saws

Progressive mill owners all over the world have been using Disston Saws nearly three-quarters of a century.

No saws have given such satisfaction—no saw has proven so economical.

The steady increasing demand is the best evidence of efficiency.

The name DISSTON has become synonymous with saw satisfaction, saw economy.

Seventy years of experience, perseverence and achievement has earned us the confidence of thousands.

Disston Saws require least power, stay sharp longer and give greater results.

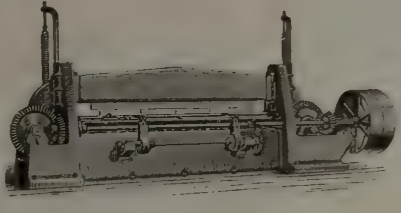
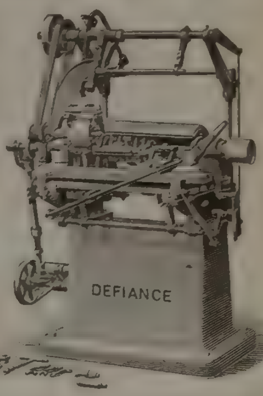
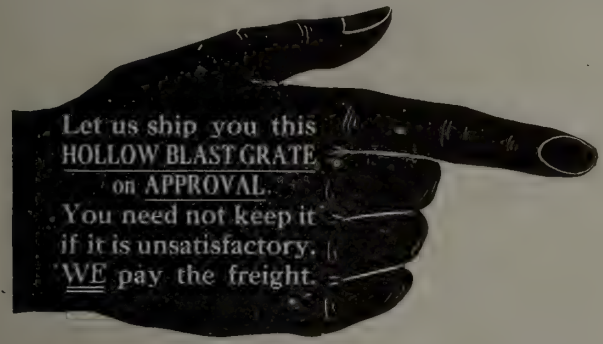
26 in. Double Surface Planer



Automatic Hoop Cutter



No. 6 Double Equalizer



Let us ship you this HOLLOW BLAST GRATE on APPROVAL. You need not keep it if it is unsatisfactory. WE pay the freight.

On the market twenty years, first in its original and then in its improved forms. Over 6,000 sets in daily use.

The following is a sample of our correspondence :

Before Using

Cleveland, O., Dec. 10th, 1907.

The Gordon Hollow Blast Grate Co.
Greenville, Mich.

Gentlemen :

I have three 300 h.p. Wickes Vertical Boilers with Dutch ovens attached to a 4-ft. chimney in use at my saw mill, burning all wet fuel, but I am not able to raise enough steam. Each grate surface is 7 ft. wide by 6 ft. long.

Will your hollow blast grate improve my condition and raise my steam?

If so, I would kindly ask that you give me your price on same.

Awaiting your reply, I remain
Very truly yours,
THEODORE KUNDTZ.

After Using

Cleveland, O., July 24th, 1909.

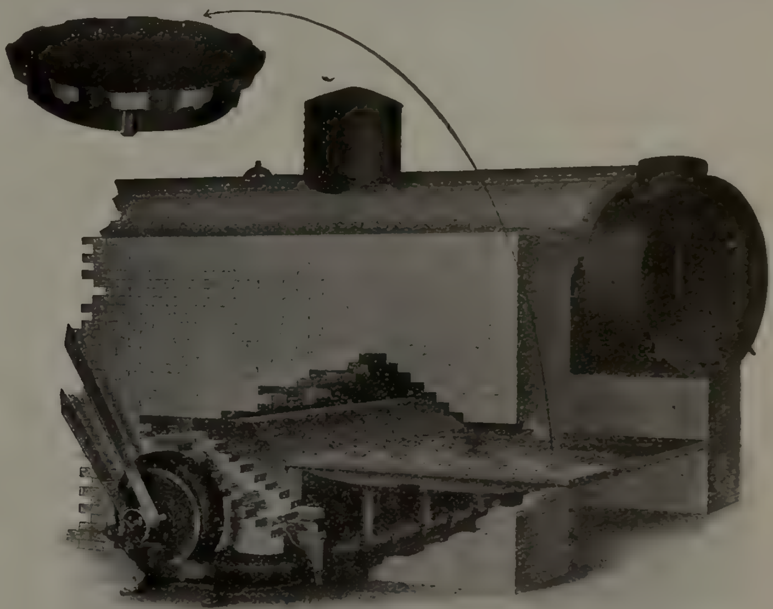
The Gordon Hollow Blast Grate Co.,
Greenville, Mich.

Gentlemen :

I had three 300 h.p. boilers in use at my saw mill, burning mostly wet fuel, and WAS NOT ABLE TO RAISE STEAM ENOUGH TO KEEP RUNNING.

Since installing your hollow blast grate I have been using only TWO of the boilers and have STEAM TO SPARE and I would recommend your grate to anyone using WET FUEL or NOT HAVING CHIMNEY DRAFT.

Very truly yours,
THEODORE KUNDTZ.



The Gordon Hollow Blast Grate can be used in plain furnaces or Dutch ovens, and with any number of boilers, from one up. Calls for no change in construction. Easy to install and operate. Saves labor in firing. Is kept comparatively cold by the current of air within, which makes it practically indestructible. Does not throw sparks. Can be fired on without running the blower, if desired. This is often necessary at night.

In writing for prices state how many boilers you have and whether you have ordinary furnaces or Dutch ovens, and give width and length of grate surface or surfaces

Gordon Hollow Blast Grate Co., - Greenville, Michigan

Simonds Knives
THE SIMONDS KNIVES
THE SIMONDS KNIVES
THE SIMONDS KNIVES
THE SIMONDS KNIVES

WE have been making Knives seventy-eight years, long enough for us to be sufficiently sure of the Knives we make, to give an unqualified guarantee of satisfaction with them.

The steel used in Simonds Canada Saw Co., Limited, Knives is our special crucible steel, made in the Simonds Steel Mill especially for Simonds Saws and Knives.

Thus you will see we start right, and thereafter the steel is handled most skillfully until the finished knife is produced.

Whether you want Planer, Veneer, Stave, Shingle, Moulder or any other woodworking machinery knives, you may go as far as you like, try as many makes as you like, you cannot improve on Simonds Knives. Of course, different conditions require different knives, a difference in the temper most likely. Given an idea of the kind of woods to be cut, the machine on which the knives are to be used, and the dimension, we guarantee to give you Simonds Knives that will be perfect in balance and temper, exactly right to do the greatest amount of smooth cutting with the least amount of wear and care.

When you buy Knives, always buy Simonds

Canada, United States and Great Britain, $2.00 per year in advance; other foreign countries embraced in the General Postal Union, $3.00.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 31 Toronto, March 15, 1911 No. 6

Specify all Important Details

In spite of the continual advice which business men give one another and which is repeated from time to time in every important trade journal, cases are continually occurring in which business men ignore the simplest maxims of business sense and let themselves in for extensive legal costs and no end of worry. The most prolific source of trouble of this nature is the failure of parties to a transaction to make a written record of the details of an agreement for purchase and sale. When an order is given to a travelling representative of a manufacturing or supply house of any nature, there should be no uncertainty whatever about the goods involved, the price agreed upon, the terms of payment or the particulars of delivery. This seems to be so elementary a matter of business that it is hard to understand why it is not invariably carried out. Yet cases are of daily occurrence which show that this simple insurance against legal expense is ignored.

A case very much to the point is provided by the action which recently came to trial in a British Columbia court. The case of Atkins vs. Annable Lumber Company involved the simple purchase of a quantity of machinery. Apparently, when the agent of the machinery company left the representative of the defendant company, he congratulated himself upon having secured a good order, and the lumber company no doubt looked forward to the early receipt of the machinery in satisfactory completion of the transaction. Provision was only made in a verbal manner for the details of freight and duty costs, and the result was, that when a claim was made for certain freight and duty charges, the lumber company claimed that these were not in accord with the agreement which had been made.

Into the merits of the claims of the two parties to the action it is unnecessary to go. Details of the case are published elsewhere in this issue. Apparently both acted in good faith and, as the judge remarked in rendering his decision, there was a misunderstanding. He placed the burden of proof upon the defendants, and they accordingly had to pay the sum claimed by the plaintiffs.

The testimony given at the trial showed that the two parties to the transaction had separated without any clear understanding of the details relating to the points which later constituted the cause of dispute. These were elements of a deal which invariably occur and they should never be left in any doubt. Had they been made the subject of a written order in this cas the legal proceedings would have been avoided.

Although this case involves a transaction in machinery, the same point is frequently occurring in the sale of lumber. Details of grades and other matters, which frequently permit of a great difference of opinion unless they are clearly set forth in black and white, are left to a mutual understanding, which, as often as not, is dictated by a sort of general good fellowship which exists between the members of the trade. This habit is sure to lead to trouble sooner or later. It is of the greatest importance to all parties to such transactions that they should have definite forms of procedure in all such cases.

Practical Resolutions on Forest Fires

At the recent Dominion Forestry Convention, which was held in Quebec, much attention was given to the matter of the preservation of the forests of Canada from destruction by fire. The results of the discussion upon the subject, and of the papers which were read by members who have devoted their time to its study, a series of practical resolutions was passed, summarizing the situation and making clear-cut suggestions for the protection of the forest resources of the country.

One of the most notable developments of the lumbering industry of late years has been the increased attention which has been given to this matter by the most practical and successful lumbermen. In all parts of Canada an appreciation of the situation has been awakened among lumbermen and it is especially noticeable that they are not only studying the matter minutely, but putting into actual operation the results of the information which they have secured. In this connection the work of the Canadian Forestry Association has been of material assistance, not only to those who have made the matter of forestry a study, but to those who have in their care, the actual conversion of the products of the forests into manufactured articles.

Among the resolutions which were passed at the convention were the following:—

Whereas, it is a matter of notoriety that the loss of a large proportion of our forest wealth is due to the fires set by locomotives passing through our wooded areas, and whereas the Dominion "Railway Act," provides as follows: "Whenever damage is caused to crops, lands, fences, plantations, or buildings and their contents, by a fire, started by a railway locomotive, the company making use of such locomotive, whether guilty of negligence or not, shall be liable for such damage and may be sued for the recovery of the amount of such damage in any court of competent jurisdiction; Provided, that if it be shown that the company has used modern and efficient appliances and has not otherwise been guilty of any negligence, the total amount of compensation recoverable in respect of any one or more claims for damage from a fire or fires started by the same locomotive and upon the same occasion, shall not exceed five thousand dollars. The compensation, in case the total amount recovered therefore is less than the claims established shall be apportioned amongst the parties who suffered the loss as the court or judge may determine."

Therefore Resolved, that with the sole idea and motive of compelling the railway companies to exercise great care in the operation of their lines through wooded areas, it is advisable in the interest of our public forests and other wooded areas, that the said section be amended so as to leave the railways responsible for all damages that may occur through fires set by their locomotives.

Resolved, that this convention wishes to place on record its heartfelt satisfaction at the great advance in the appreciation of forest preservation throughout the Dominion, and recommends that in all forest lands controlled either by the Dominion or by the provinces there should be a more systematic development of forest protection by educated forest inspectors, fire rangers, fire lines, fire roads, telephone lines, etc., and that as the value of the forests has increased there should be more adequate amounts spent for protection.

Resolved, that this convention approves of the legislation introduced by the Dominion Government for the setting aside of a forest reserve on the eastern slope of the Rocky Mountains for the purpose of protecting the forests and the water supply, and would strongly recommend a sufficient appropriation by Parliament for its proper supervision and development.

RESOLVED, that it is expedient in the public interest that the Provincial Governments should consider the question of controlling fires set out for the clearing of lands adjoining forests, and should promote such legislation as will prevent the same spreading into the neighboring forests, thus also protecting the settlers and their property.

RESOLVED, that this convention approves of the action of the Governments of Ontario, Quebec and British Columbia in requiring that timber cut on Crown lands be manufactured in Canada, and would be pleased to see the other provinces follow their example.

WHEREAS, the forests of Canada are a great national asset, and whereas the welfare of our agriculture, health and climatic conditions, as well as the national prosperity of the country depend upon the proper and scientific care of the forest areas.

THEREFORE RESOLVED, that this convention commends the action of the Province of Quebec in employing technically trained foresters in its service, and recommends to the other provinces of Canada the importance of this policy.

Portable Mills a Thorn in the Flesh of the Large Operator

The irresponsible owner of a portable mill is perhaps the greatest single source of trouble to the lumber industry that could be named. This is not to say that there are no manufacturers using portables who are not well versed in the matter of making good lumber and who do turn out a grade of lumber which is saleable and causes no disturbance in lumber markets. But such a man is a rarity and there are, alas, so many of the other kind that one hears of them at every turn. In days like these when everyone is laying stress upon the necessity for getting the very last square inch possible of good merchantable lumber out of a log, it is a puzzle which is difficult to answer, why governments, or economic conditions alone, do not make it impossible for lumber butchers, with their little portables, to continue in business and to disorganize the market for lumber in their neighborhood.

The lumber manufacturers of Canada are perhaps as generous-minded as any other class, and they would be ready enough to live and let live under ordinary conditions, but it is not to be wondered at if they complain when they see their own lumber selling at a loss or eating itself up in storage charges, while some badly butchered stock from a few portables is being hawked about at prices which often involve a loss to the portable manufacturer, although at the time he may not suspect it. Not only does such stuff demoralize the market so far as prices are concerned, but the consumer who buys such lumber soon knows that he has been stung and has a bad word to say for the moral standing of the lumber trade as a whole.

The situation in Ontario is outlined in a letter received by the "Canada Lumberman" from one of the most prominent manufacturers in the province. After referring to trade conditions the writer says: "The blooming portable mills are the bane of the lumber trade. The great majority of them butcher the lumber—which will not bring, of course, the price of well manufactured stock. They do just enough business to hurt the trade. We believe there should be a special or some kind of tax on these plants—which at present pay nothing, whereas regular lumbermen have regular taxes to figure on as a sure thing. Possibly a license to run a portable mill would be a good thing, and help to regulate this class of business, eliminating a large proportion of the wood butchers."

While the suggestion that a special tax be placed upon portable mills would seem commendable to the large lumber manufacturers, the situation is one that renders such a course scarcely practical. The portables cut most of their lumber from private lands. Settlers who want their land cleared, find the portables of considerable assistance. The number of portable mills on Crown lands is comparatively small. Sometimes a portable mill will go on to a limit on Crown lands after it has been lumbered over by a regular license owner. In such cases the portable mill owner is subject to the same stumpage dues, etc., as the large license owner, but he has advantages in the way of mobility which the other has not. If he is in an organized district and there are taxes to be paid, he may be out of the district and away to pastures new, before the assessor comes round. When the portable mill owner is cutting on private lands the timber which he is cutting is the absolute property of the settler, and government regulation of his operations is not possible. It comes about, therefore, that the portable mills are usually cutting a grade of timber which is vastly inferior to that of the large stationary mills and that to some extent they are not subject to the same taxation that the stationary mill owners have to pay. The class of timber which they secure makes them careless about the way they cut it into lumber, and their inferior product comes on to the market to compete with the regular product of the large mills and to cause continual annoyance and frequent loss to the trade.

This is a problem which has been with the trade for many years and promises to become more serious instead of less so, as times goes on. It is scarcely to be assumed that a remedy could be secured in the way suggested by our correspondent. There are many who believe that it is an evil which cannot be prevented at all. There seems to be little hope for improvement by way of educating the portable mill owner, because of his evanescent nature. He is with us to-day and away to-morrow, and a new portable goes into the business as often as, if not oftener than, an old one goes out. When the general trade conditions of the country are prosperous the influence of the portables is not so serious, but when it is difficult to secure a profit for lumber under ordinary conditions, the portable becomes a thorn in the flesh of the large mill owner. If someone could devise a remedy for the situation he would be acclaimed as a benefactor by the trade and the benefit would in the end be felt by the owners of the portables as well as by the others, for they would be forced to adopt more businesslike and at the same time more profitable methods of conducting their operations.

Mr. Sifton's Views on the Pulpwood Question.

Lumber and pulpwood manufacturers in the Provinces of Ontario and Quebec will be much interested in the remarks made by Hon. Clifford Sifton in his address before the House of Commons upon the reciprocity proposals, so far as those remarks referred to the matter of the export of logs from the provinces. Ontario has felt the benefit of the prohibition of the export of logs so forcibly, that no amount of inducement in the way of reciprocal trade advantages is ever likely to tempt her to go back to the old policy, under which her logs were felled in the Province and exported to United States mills, there to be converted into merchantable lumber. Quebec was largely influenced by the success of this policy in Ontario, in adopting the measure to prohibit the export of pulpwood cut from Crown lands in that province. Although the measure has been in force for a few months only, its effect is such that the Government of the province although not declaring itself definitely upon the reciprocity measure, which is really outside its sphere, has given the people of the province clearly to understand that they can depend upon the Act being continued in force, in spite of the premium upon its abrogation which is included in the first draft of the reciprocity agreement.

It would seem, therefore, that there is little call for all the fuss which has been made over this feature of the agreement. The United States House of Representatives in passing upon the proposal, placed this feature of it in quite a different light, so far as Canada is concerned. The clause referring to the free entry of pulp and paper into the United States from Canada was removed from the body of the agreement and mad a separate clause at the end. This makes it an Act of the United States alone, and Canada is at liberty to pass the rest of the measure without reference to this clause and to take what course it pleases in this regard. What the Dominion Government has done in the matter amounts practically to saying that the United States and the provinces are at liberty to settle the question according to their own inclinations. Inasmuch as the inclinations of the Provinces of Ontario and Quebec are well known, and not likely to alter, the chances are decidedly in favor of the matter remaining in statu quo indefinitely.

There is much opposition, however, to the course adopted by the Government of Canada in this matter and the principal criticism is that it places a premium upon the abrogation of the policies adopted by the provinces. This criticism is best expressed in the words of Hon. Clifford Sifton, which were as follows:—

"The Province of Ontario and the Province of Quebec have decided, in their wisdom, that it is a good and patriotic policy for them to insist upon their pulp being manufactured at home. I am aware that some gentlemen who are of estimable character and good information, have said that it is not a wise policy, but I do not believe there are many people in Canada who would agree with them. I believe that there is no policy, no item of policy, which has been followed by any of the governments of Canada of late years which has met with more universal approval than the action of the Government of Ontario, and later, of the Government of Quebec, in deciding upon the conservation of their resources by securing the largest possible revenue and benefit from the various resources which they possess. Well, that was the position. It is known of all men that the United States people would like to get cheaper paper made from Canadian pulpwood. Now, if there was anything that was perfectly clear in connection with our tariff relations with the United States, and if there was anything perfectly clear in connection with the paper and pulp question, it was that all the Dominion of Canada had to do was sit down and wait, and leave the subject severely alone. That, obviously, was all that ought to have been done. We have not done that. We find this clause introduced into the treaty. What does it say? If it means what our negotiators intended it to mean, it means this, that there is a bonus put upon the abrogation of the regulations which the Province of Ontario and the Province of Quebec have made. It does not mean that the regulations are abrogated, because this Parliament has no power to abrogate them; but it means that we put a bonus upon their abrogation, and that is the worst possible thing that we can do."

Editorial Short Lengths for Busy Readers

Lumbermen in the Kootenay district are watching with a deep and abiding interest the operations in fruit culture being conducted by the Canyon City Lumber Company on its logged-over limits near Creston. The land is particularly adapted to fruit culture, and it is expected that about 9,000 acres of the 12,500 acre tract will be under orchard in the course of a couple of years. Two thousand trees were set out last season.

A despatch from London, Eng., says each week as the Coronation draws nearer, lumber rises in price, owing to the enormous quantities which will be required in the erection of stands, etc. At the present moment a small fleet of steamers is leaving Riga and other Baltic ports loaded to their utmost capacity with lumber in beams, boards, and planks, destined for use in June. Ice breakers are constantly at work keeping the ports free from ice to afford passage for lumber steamers, and lumber merchants at home and abroad are rubbing their hands in anticipation of the good time coming.

Mr. W. A. Langille, supervisor of the Alaska national forests, who was recently in Portland, Oregon, on Government business, states that the United States Government will go into the timber business so as to preserve the large forests of Alaska for the people. Mr. Langille predicted that the development of the northern territory's timber resources, under Government supervision, would mean possibly more to Alaska in a few years than mining. "Alaska contains approximately 65,000,000,000 feet of timber," said Langille, "and it belongs to the Government. None of it is privately owned. Most of the forests are in the southeastern part of the territory. It is now the Government's policy to go into the timber business, supplying timber at reasonable rates for the development of the country. Much timber is being sold this year, principally to be used in connection with the salmon packing plants."

Not in several years have the northern hemlock manufacturers felt so encouraged over trade conditions as they do to-day. The market is righting itself rapidly and from a buyers' standpointetaoin market is righting itself rapidly and from a buyers' market is getting back into the hands of the manufacturer, where it belongs, for the person who has the article to sell should be the one to make the price, and this applies probably to every other business but that of lumber. That the hemlock producers will inflate values so as to cause users to substitute other woods is not expected, but it is expected that they will try to get prices that will enable them to manufacture lumber at a profit. Hemlock lumber does not sell at prices commensurate with the merits of the wood, and it is safe to say that for the last three years it has been manufactured at a loss. During 1910 demand for hemlock was good and much territory which had been lost to the southern pine trade was regained. Builders made a liberal use of hemlock, finding it thoroughly dependable for the smaller class of buildings. Another thing which has helped to strengthen the market is that, although weather conditions were ideal this winter for a normal input of logs, the outturn, as shown statistically, was fully 70,000,000 feet less than that harvested last year. This means a decrease in production of 16 per cent. It will therefore be seen that the manufacturer is in a better position to ask living prices for his product, and it looks as if he will get them, for the wood with which he comes most in competition —southern pine—is advancing steadily in value, and it is reported that many yellow pine manufacturers will further reduce their concessions, which is bound to add additional strength to hemlock.—American Lumberman.

The fact that the Great Northern has been declared responsible for the tremendous fire losses sustained last summer by owners of timber adjacent to the company's Nelson and Fort Sheppard branch line, is of vital importance not only to the parties to the suit, but to the majority of mountain limit owners and millmen as well. Many have suffered severe losses which were apparently traceable to the railways, but protests went unheeded until the aid of the Dominion Railway Commission was invoked. The searching investigation conducted by that body brought to light a mass of evidence in support of the contention of timber owners that the railways were largely responsible for the immense destruction of timber reported every summer from the mountain section of the province. Much testimony of a corroborative nature was elicited later at the various sittings of the Provincial Forestry Commission, the fact being brought home to every taxpayer that—in addition to a wholly unnecessary sacrifice of valuable assets, the preservation of which means prosperity for all—an army of fire-fighters had to be employed by the government and the millmen to wage what was too often a futile struggle against the consequences of the culpable negligence above mentioned.

The suit against the Great Northern Company was entered by E. R. Clarkson, the trial at Nelson occupying four days. The liability having been fixed by the jury's verdict, the case now goes to the spring sittings of the Supreme Court to fix the amount of damages. The plaintiff alleges a property loss in excess of half a million dollars, and varoius other claims for fire losses, covering another half million, which depended largely upon the decision in the above action, will now be pressed by the parties interested. The liability of the railway companies having been defined, it will not be long before all locomotives operating in the mountain section of the province are transformed into oil-burners, and it will be a happy day for the lumbermen when this shall have been brought about.

Quebec's Report of Lands and Forests

Annual Statement Shows Substantial Receipts from Collections, Rents, Etc.—Encouraging Results from Increased Scope of the Department's Work

The annual report of the Department of Lands and Forests of the Province of Quebec, has recently been presented by the Minister, Hon. Jules Allard. The report in part is as follows:

The total receipts from woods and forests was $1,033,895.54, viz.; $734,953.17 for stumpage dues, $242,708.00 for ground rents, $45,559.95 for penalties for infringements of the law and regulations; $4,561 for bonuses on transfers and $6,113.42 for interest. In the previous year the receipts totalled $906,360.64.

I would call attention to the predominant question in so far as our revenue is concerned, that of the administration of woods and forests. We are entering upon a new era in which not only have the regulations affecting the cutting of timber generally been altered to a serious and far-reaching extent, but in which the system of fsupervision has been radically changed. A fact worthy of note in this connection is that the yearly revenue from woods and forests will be increased by an amount of $350,000 through the increase in the tariff and ground rents.

With the imposition of heavier charges, a more constant, more complete, and more energetic supervision became indispensible. To this must be added the fact that, as the obligation to manufacture in Canada did not apply to lands held by private individuals, we are obliged to take special precautions to enable us to distinguish the origin of timber not subject to the law from that subject to its restriction.

For these reasons and owing to such exceptional circumstances, I thought the time had come when, in all necessity, we were bound to put an end to our old, obsolete system of supervision and organize a new one with a better educated and more active staff which could meet all the requirements of the moment.

The staff of forest officers acting under the direction of Mr. Piche, who is specially appointed to that office, has charge of all lumbering operations in the province, and the latter is divided into 14 districts for the purposes of such organization.

Nearly all the members of the former staff have been retained in their employment, but they will be replaced by the fresh recruits to be supplied by the forestry school (whose course of instruction under the auspices of Laval University was inaugurated a short time ago), as fast as they acquire the necessary knowledge to make them fit for the services we expect from them.

The transactions effected by the Woods and Forests Branch compare favorably with those of the previous two years, showing a marked increase in nearly all the items of revenue.

The frequent rains of last spring and summer, sent by Providence at the opportune moment, spared our forests from the calamities from which the United States and some of our sister provinces have suffered. If, however, we were protected from that evil through quite exceptional weather, it should not be inferred that our forest protection service was of no use to us. Too much attention cannot be devoted to the improvement of the organization for preventing and extinguishing forest fires in order to avoid great conflagrations. Lumbering operations, well directed and under proper control, cannot injure the development or conservation of our forest wealth, but fire destroys everything to the very humus covering the ground and leaves behind it but calcined rocks and desolate solitudes for centuries to come.

An interesting table in the report gives details of lands which have been alienated by sales and free grants, the territory divided into town lots and the land that has reverted to the Crown after cancellation of sales, from July 1, 1867, to June 30, 1910. The totals are as follows: Crown and clergy lands sold, 6,589,941 acres; free grants, 399,618 acres; territory divided into farm lots, 4,961,352 acres; lands reverted to the Crown after cancellation of sales, 1,743,930 acres.

The quantity of timber, etc., cut during the fiscal year, with comparisons with the previous year, was as follows:

		1910	1909
Area under license	Acre cu. ft.	70,058	67,428
Square timber cut	Acre cu. ft.	237,843	183,748
Spruce, hemlock, balsam, cypress, white birch and poplar, saw logs and boom timber	feet B.M.	459,839,665	364,188,011
White pine and other varieties, saw logs and boom timber	feet B.M.	129,686,804	122,271,737
Red pine, saw logs & boom timber	feet B.M.	19,241,460	18,304,030
White pine, 11-inch and under, saw logs	feet B.M.	58,306,700	49,573,812
Poles	lineal ft.	63,443	39,940
Pulp wood	cords	*384,715	†359,858
Fire wood	cords	3,079	841
Railway ties	pieces	944,637	978,443
Pickets	pieces	86,034	52,048
Shingles	thousands	441	4,299
Spool wood	cords	3,718	8,358
Posts and rails	pieces	56,559	10,644

*Of which 191,301 cords were exported from Canada.

†Of which 142,200 cords were exported from Canada.

The amount collected in timber dues, rents, etc., $1,033,895, was greater than in any year since 1905. From 1899 to 1905, inclusive, the annual collections were slightly greater. Previous to that date they never reached the million dollar mark.

Among the expenditures of the year the sum of $13,500 was devoted to the protection of forests against fire. In the previous year this service cost $20,500.

The annual report of the forestry service of the Province of Quebec, which is included in the report of the Department and Lands and Forests, contains a great deal of matter of practical interest to lumbermen. The field of action of the Forestry Service was enlarged during the year to include all the counties from Maskinonge to the Ontario boundary.

Mr. G. C. Piche, chief of the Forestry Service, says in the report:

Supervision During 1909-1910.

As I have just stated, our field of action was enlarged and, instead of a portion of the counties of Montcalm, Joliette and Berthier, it comprised this year all the counties from Maskinonge to the Ontario boundary, including thus the two upper and lower Ottawa agencies.

In that territory there were 27,770 square miles under timber license, besides the forests recently leased in Abitibi along the Transcontinental. Our supervision also extended to 136 townships subdivided and sold as settlers' lots, making 2,500 additional square miles. I divided the supervision into eight districts, putting a forest agent at the head of each one with two or more forest-rangers under his orders.

To properly supervise lumbering operations, the Government officer must go to each camp at least once a month; this will enable him to follow the operations in a satisfactory manner and prevent abuses continuing on a large scale.

We insist upon a shanty book being kept in every camp. At the beginning of the book are entered all the regulations of the Department ment of Lands and Forests respecting the minimum diameters at which trees may be cut, with the penalties for infringement of the regulations and for waste; also the duties of cullers and forest-rangers, etc., so that nobody who is interested can plead ignorance.

Eight pages are reserved for entering the quantity of timber cut and teamed daily. On every page are several groups of columns for the various kinds of timber cut. In several camps the various kinds of trees are noted separately; in others all are entered together. These shanty-books have been greatly and even rather severely criticized, but I think that with the competent staff the Government now has for the supervision of such camps, there is no fear of the shanty-books being a source of annoyance, as in the past. Moreover, the regular and frequent visits of our officers to the shanties ensure the books being brought to date once a month.

There is one thing to be guarded against, and that is that the quantities entered in such books do not represent the full quantity of timber cut at any camp. For, as I explained in my report for last year, the axemen work by the job and must furnish so many logs a day. Notwithstanding all the efforts made by the companies to make them give accurate accounts, most of them keep a reserve or bank for the days when they may cut less, so as to show the same result for those days. The result is that the shanty-book often shows less logs than have really been cut, but it may also happen that it shows more. This happened last winter in a shanty on the Coulonge river, where it was found that there were 350 logs less than the shanty-book showed; but, as 20,000 logs had been cut at that camp, the difference was not too great. The figures given by the shanty-books are approximate quantities, within a margin of one or two per cent. of the cut. As such the information is valuable, for it gives a first check on the lumbering operations. I do not think the error can exceed 2 per cent., especially if the number of logs teamed be also taken into account, for we then have two checks. In some camps, even, three accounts are kept: of the timber cut, the timber skidded, and that teamed.

Cutting.

We continued last year's work, requesting the license-holders to be more methodical and more economical in their operations, and I am happy to bear testimony to the fact that the great majority of them greatly assisted us. Some companies even anticipated our action and their operations are carried on as well as can be desired under present conditions. Last year I mentioned the cuttings of the St. Gabriel Lumber Company under Mr. McLaurin's management, where the trees are marked out before they are allowed to be cut. This system has been extended to all the branches of the Union Bag and Paper Company, viz., the Charlemagne & Lake Ouareau Company, the St. Gabriel Lumber Company, and the Union Bag & Paper Company (Three Rivers district). The Riordan Company, on the Rouge river, has also introduced great improvements in its operations and overseers have been appointed to assist us. On the Gatineau, the W. C. Edwards and the Gilmour and Hughson companies work their limits very well. In the county of Pontiac, Messrs. Fraser & Bryson have the best cuttings that can be desired.

On the whole we have to report progress, great progress. The new regulations respecting the height of the stumps, the cutting of all merchantable timber, etc., have been fairly well observed as a rule. For a first year, I consider that things have gone well and now that people are familiar with our regulations, there will be no difficulties.

For the benefit of those who have not read my report for last year, I will recall the various points in connection with which waste in the present lumbering operations can be decreased.

1. Cutting.—The stumps should be as low as possible, as the timber there is thicker and of better quality. The waste in this respect may be as much as 6 per cent. Our regulations require that the stumps be not cut more than two feet above the ground, but this is still somewhat high, and lumbermen should cut them lower; some do, in fact.

We compel them to take all merchantable timber down to a diameter of six inches from the tops. This is the stumbling-block of many lumbermen. We have been lenient towards such offences in the past, but this year we will take everything into account and, above all, impose severe penalties to prevent as much timber being wasted as formerly. I have recommended the use of two different units for the length of logs: 12 and 16 feet, which would allow of all the timber in a tree being taken. A firm working at Lake Kippewa has its trees cut beginning at the top, so as not to lose a foot of timber, but the great majority of the axemen cut their trees into logs, beginning at the foot of the tree without any heed of its length, and it very often happens that they cannot get a last log in the top, because sometimes a foot is wanting for the required length and all this is thus lost. There is still more; by not cutting intelligently, the value of many pieces is lost, especially in the case of pine.

I again recall the fact that, at Bogalusa, in Louisiana, the firm lumbering there, not wishing to trust its axemen, brings whole trees down to its mills. They are put into a first pond, whence they are taken and sawn by a circular saw into proper lengths and according to the orders the company has on hand; the logs are then put in a second pond for the ordinary sawmill. The profit derived from this is estimated at 10 per cent.

The use of saws for cutting trees into logs is general in the two divisions under my charge. It is otherwise at Lake St. John, and we shall have much work to do there this year to get the men to use saws for felling the trees and cutting them into logs, except in difficult cases.

We lay much stress upon the axemen sparing the smaller trees both while felling and while making hauling-out roads. We see that the latter are not wider nor more numerous than is necessary. The latter remark may make many people smile, but it must not be forgotten that, in the extensive territory under our supervision, we have to deal with many queer-minded people. Thus, my colleague, Mr. Bedard, found a man who made hauling-out roads every thirty yards, which enabled him to cut timber below the regulation diameter, where the trees were small, without infringing the law.

2. Choice of Trees.—We would greatly desire that our limitholders should soon give up the old system of cutting only one kind of trees. This is due chiefly to the remoteness of the limits operated on and to the conditions of accessibility, for the timber in the greater portion of the regions where lumbering is now carried on, can be got out only by water, which permits of the taking away of floatable timber only, such as pine, spruce, balsam, firm and cedar. It is due also to the conditions of the market where the demand for hardwood timber is very limited. It is urgently necessary to study the means of utilizing the other timber so as to be able to count upon adequate reproduction. As everybody knows, the various kinds of trees contend with one another for the possession of the forest soil and the stands are formed proportionately to the abundance of the mother seed-trees and also to the conditions better suited for one kind than for another. When conditions are equal, it is evident that the species represented by the most individuals will have the best chance of perpetuating itself and of forming an ever increasing proportion of the forest so that if the trees of that kind be all taken away, as is now done, the trees of the remaining species will scatter their seeds over the soil previously occupied by the former and the latter will disappear from its area. It is therefore necessary that seed-trees be left in the areas operated upon, at least two or three per acre, and moreover that all other full-grown trees be cut down. One of the defects of the present system also is that all the mature trees, even of the kinds utilized, are not removed, except the seed-trees, of course, because operations are not systematically carried on and also because the timber in places difficult of access is not always cut. Last year the Belgo-Canadian Company inaugurated a system of inspection which gives very good results; an inspector is instructed to follow up the jobbers' operations, to make them observe the regulations, but also to ascertain in what places cutting will soon be done and to compel the jobber to take away all the merchantable timber in the place where he works. Through this system, through the economy effected and the complete utilization of all mature trees, a certain zone of their limits has furnished work for four years, while they had calculated on working for two years only under the old system.

3. Burned, Overthrown Trees, etc.—When operations begin late on account of the snow, the axemen can get at the standing timber only or green timber, as it is called. But, when the cutting begins in September or before then, the lumberman finds much profit in cutting into logs the trees that have been thrown down by the wind or killed by fire, and even the old pines lying on the ground which the first lumbermen have left behind. Hon. Mr. Bryson took much care in his cuttings last year; he got over 150,000 feet b.m. of old pine on his River Coulonge limits. This is very profitable working, because the timber is still of good quality. With wind-falls it is necessary to hurry. Thus, in November, 1907, a formidable hurricane threw down thousands of trees in the central section of the province; several lumbermen, such as Messrs. Bennett & Company, had them cut at once, but many private owners neglected to do so and one may now see, between Pont Rouge and Belair, on the line of the Canadian Pacific Railway, numbers of trees that were overthrown then and have not yet been utilized. At present the insects and fungi have destroyed those trees, whose timber is quite unfit for use and which would have yielded good products had they been utilized in time. In lumbering, as in any other industry, one must know how to work at the proper time and, above all, to turn to account all the products that can be obtained from the forest.

During the past two years fire has done little damage to the forests of this territory; small fires only have broken out at various points, but, in the Mattawin region, near St. Zenon, a fire destroyed several square miles of the territory of the Charlemagne and Lac Ourareau Company. We had an understanding with Mr. McLaurin, the director of that company, and last year several thousand cords of pulpwood were cut, which otherwise would have been completely lost.

This being explained, it is easy to see the importance of the control by the forest officers and, above all, the great economy the Forest Service seeks to effect in lumbering operations. As we have already seen, we have been greatly aided by the license-holders and their agents. So much so, that we consider that operations were 15 per cent. more economical last year than in the past. If this gain were put in feet, board measure, it would be seen that there is a net profit for the stumpage dues of at least $60,000 in future and that cutting can be carried on at the same place for one more year in seven. Under this sole head the Forest Service has enabled the province to gain more than the amount of its yearly cost.

Culling.

We devote much attention to culling, because the accounts for stumpage are made out on the cullers' returns. The shanty-book now contains the culler's return, which he is obliged to enter after each culling at a camp, because such data are very useful for checking the work. The members of the service have been instructed to make an arrangement with the cullers to have them keep separate accounts for each skidding place. Many refuse to do so, alleging that it gives them extra work, but we gradually succeed in getting all we want from them. One of the great difficulties at present is that in the western part of the province all the wood is measured in the forest, while from the River St. Maurice to the Atlantic, it is done on the banks of the streams and even on the ice. In the first case it is easy to measure the timber and we have little trouble with the cullers. But when the timber is on the banks of streams or, worse still, on the ice, our checking becomes more difficult. Therefore we are endeavoring to introduce the first system everywhere. Such a reform cannot be effected at once, but we hope to obtain it gradutlly.

Supervision of Lots Sold by the Crown.

We continued to watch the cutting of timber on non-patented lots and are in a position to assert that speculation has greatly decreased in our division. The famous stories in connection with Boyer Township may be considered finished. Illegal cutting of timber has virtually ceased at Temiscamingue, etc. We have collected relatively much fewer fines this year than last. This is due to the fact that there are few offences. We imposed as must as fine times the amount of stumpage fewer offences. We imposed as much as five times the amount of stumpage in cases of bad faith. This step, which made speculation unprofitable, has had a magical effect. This year many hope to benefit by the new law prohibiting the exportation of timber cut on Crown lands, but we intend, in every case of illegal cutting, to forbid the taking of the timber out of the country. Such a step is necessary, for otherwise we should be assisting organized theft from lots not yet patented which were sold previous to the 1st September, 1910. We have had many cases where poor bona fide settlers have been induced to infringe the law; whenever we were able to make sure of the delinquent's good faith, the Department has always been generous.

We now have a report of every lumber establishment in our territory working the raw material. We are co-operating with the Ottawa Forestry service for the publication of complete statistics in connection with the operations of such establishments. I attribute much good to the regular visits and inspections of local sawmills, which are often the centre of illicit operations. As the owners of sawmills are compelled to strictly account for the source of supply of their logs, they are more prudent and consequently buy less from speculators.

I must say a word in connection with the processes of sawing which are more than rudimentary. At least 30 per cent. of the logs are wasted in sawing. Defective plant, unskilfulness and negligence on the sawyer's part cause the boards to be of unequal thickness and consequently of less value. From the standpoint of the preservation of our timber, a fine campaign might be inaugurated.

Through the foundation of the school of forestry, the Government has secured the recruiting of a competent and educated staff for the control and administration of its forests. Every student must first spend a year in the forest before following the school course. All the holders of scholarships are employed in the Forestry Service as student assistants and render us great services. The Government allows them $25 per month with their travelling expenses and board, so that the students can save up a little money.

In a few years we shall need a school of lesser importance for the recruiting of forest rangers, as the present school for the training of forest engineers admits only young men who can pass a rather strict examination. The place for such a school is already found at Berthierville, where the Government owns a nursery of some importance and a fine wood.

Technical Work Done by Limit-Holders.

Several lumbering companies in Quebec now employ forestry engineers who make an inventory of their property. Last year I reported the fine work done by Mr. Lyford, a forestry engineer of Yale, for the Riordan Company in the upper basin of the Rouge. The work is now finished and the company is highly satisfied with it. The Messrs. Brown, of the Quebec St. Maurice Industrial Company, have engaged one of Mr. Lyford's assistants, Mr. de Carteret, to make an inventory of the territory they have leased from the Government on the upper St. Maurice. The work is now being done and future students of the school of forestry are engaged in it. Mr. Galarneau, another Yale student, is working for Messrs. Fenderson & Co., in the Matapedia valley, making an inventory of their limits and seigniory. The Laurentide Paper Company also has in its employ a forestry engineer, Mr. Ellwood Wilson, who has made a survey of its limits.

We have begun the formation of a forestry museum. The Pink firm, of Pembroke, Ont., has been good enough to send us a complete set of its implements and appliances for the work of driving timber. Several manufacturers of saws, axes, and other lumbering implements are also to send us samples of their products. We have much pleasure in acknowledging the receipt of a lot of specimens of woods from the United States Forestry Service and we are to get others from abroad, in particular from the Indo-China Forestry Service. Several lumber merchants have offered to send us samples of the various products of their establishments, so that our museum will soon be complete.

Logs Threatening Quebec's Water Supply

Mayor Drouin, of Quebec, is greatly agitated regarding the possible pollution of the city's source of water supply as a result of the intention of a lumber company to float its logs down the River St. Charles during the coming summer. The river is shallow and muddy and it is feared that the logs will stir up the mud on the banks of the river and shores of the islands to such an extent as to pollute the supply for the city. The chief medical health officer and the chief engineer of the city have both reported against permitting the lumber company to float its logs within a stated distance of the intake for the water supply. In former years the city has been able to persuade the Quebec Legislature to prohibit the floating of logs on the river. This year, however, it is feared that the Legislature will not interfere. The mayor is seeking to awaken public interest to the danger.

Use of Forestry Students by Lumbermen

Editor, Canada Lumberman:—It may interest some of your readers to know that the students of this Faculty are prepared to make topographic maps and timber estimates of superior character. I may refer in this respect to the Turner Lumber Company and the Collins Inlet Lumber Company, who have employed such students for several seasons.

There are a few men who prefer private employment left, ready to undertake summer work (from fire ranging to estimating), and applications will be considered as long as the supply lasts.

Yours very sincerely, B. E. Fernow, Dean.

Increase in New Brunswick Crown Lands Receipts

The annual report of the New Brunswick Crown Lands Department has been submitted in the Legislature by Hon. W. C. H. Grimmer, Surveyor-General.

The following statement is given showing the comparative receipts from Crown Lands for the years ending 31st October, 1909 and 1910:

	1909	1910
Timber licenses—		
Sales	$ 1,618.50	$ 4,238.75
Blue Bell	1,190.00	....
Renewals	79,970.00	81,057.00
Stumpage	246,742.77	330,360.28
Land sales	3,376.00	4,188.75
Labor fund	194.80	258.70
Instalments	......	56.30
Deposits for survey	786.50	721.50
Orders of survey	211.00	145.00
Land leases	1,010.00	1,277.00
Mining leases and applications	6,737.44	9,240.54
Royalty	3,272.44	4,631.34
Fishing leases and licenses	15,562.00	15,905.50
Game licenses	33,166.11	41,010.19
Guides' certificates	152.00	130.00
Fines	1,065.02	733.94
Miscellaneous	53.50	38.50
Taxidermists, pelt and meat licenses	42.50	117.35
	$395,283.58	$494,491.64
Increase for the year 1910		99,208.06

In the stumpage collections those paying over $1,000 were:

Bathurst Lumber Co., $8,748; Burchill, John P., $2,660; Bearinger & Chapin, $4,814; Culligan, A. & J., $2,965; Credit Foncier Canadien, $8,514; Chapman, A. C., $1,875; Dalhousie Lumber Co., $19,172; Dominion Pulp Co., $3,947; Eastern Trust Co., $3,554; Gibson, Alex., Railway & Manufacturing Co., $6,277; Gloucester Lumber & Trading Co., $1,811; Guimond, Couillard, Freres & Co., $2,557; Gregory, J. A., $1,500; Hichman, C. S., $2,479; Hilyard Bros., $1,496; Inglewood Pulp Co., $2,241; King Lumber Co., $1,601; Kitchen, Willard, $1,837; Lynch, T. Co., $5,096; Louison Lumber Co., $10,160; Moore, John E., $6,705; Millers Tanning Extract Co., $2,706; Maloney, John, $1,198; Miramichi Lumber Co., $19,965; Mowat, B. A., $4,020; Miller, W. H., $1,385; Murchie, James & Sons, $1,314; Miramichi Pulp & Paper Co., $5,363; McLaughlin, J. D., $8,024; McMillan Co., Ltd., $2,060; Nepisiguit Lumber Co., $16,365; Oromocto Lumber Co., $1,180. Prescott, Isaac C., $1,433; Peel Lumber Co., $1,266; Prescott Lumber Co., $5,143; Pejepscott Paper Co., $3,630; Robinson, James, $3,962; Ritchie, Allan, $2,204; River Valley Co., $1,500; Richards, Wm. Co., $22,631; Rundle, James, $2,454; Randolph & Baker, $3,465; Snowball, J. B. Co., $18,250; Sumner Co., $1,706; Sayre & Holly Lumber Co., $4,508; Shives Lumber Co., $27,016; Sullivan, D. & Sons, $3,409; Saint Croix Paper Co., $1,612; Sadler, F. D., $2,044; Stetson, Cutler & Co., $4,766; Swedish Canadian Lumber Co., $2,753; Swim, Henry, $1,567; Sinclair Lumber Co., $3,740; Scott, John S., $1,353; Upham Lumber Co., $1,001; Walker, John D., $2,800; White, C. T. & Son, $2,437; White, C. T., $8,686; West, Alfred, $2,163; Cash collections, $1,328.

Woodworking Possibilities of Chatham N. B.

The Board of Trade of Chatham, N.B., held a banquet recently at which many excellent addresses were delivered. The object of the banquet was to direct more general attention to the advantages which Chatham presents for the location of manufacturing industries. One of the principal speakers was Mr. R. A. Snowball, who referred to Chatham as a location for woodworking industries. He had often wondered, he said, why in so favorable a centre, more woodworking industries had not been established. Looking backward as long as he could remember, there had been no improvement in method. Mills were being run now exactly as they were forty years ago. The mills were still turning out boards and deals and scantlings. The wood was not being manufactured. It was being sent away in the rough to be manufactured in other countries. He regretted the stoppage of the pulp mill, and hoped to see it soon at work again. There seemed to be a lack of inclination on the part of capitalists to invest their money in these industries. They were content to do the rough work and leave other countries to reap the profits of manufacture. There was no district in which better opportunities offered than in Miramichi, if only people would take advantage of them.

Ald. Haley, who followed, said that Chatham was, from its situation and surroundings, an ideal place for wood industries and nothing more could be said. He spoke of the hardwood which was going to waste as fuel, and said there was a chance for all to establish successful industries if they would only come to it.

Geo. Watt said that last year $2,000,000 worth of wood was exported from Chatham, but he regretted that it was all in the rough. They should endeavor to export more manufactured wood and so keep the wages at home.

Lumbermen Active in Civic Affairs

Members of the Westmount and Montreal Trade who have Devoted Themselves to Westmount's Public Welfare

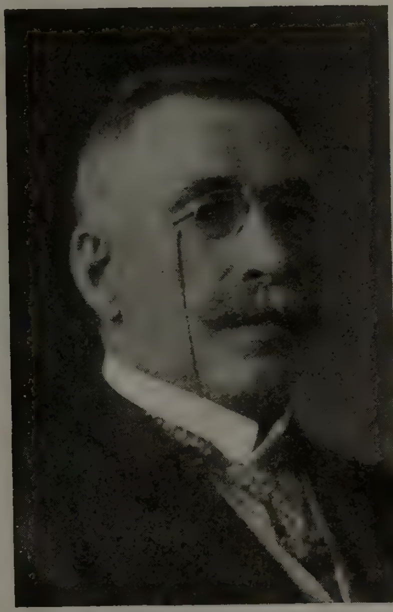
The prominent position which the lumbermen of Canada have taken from time to time as public citizens has frequently been a matter of comment. Lumbermen have been unusually prominent in all walks of public service. By their extensive acquaintance with the country and its needs, they have been enabled to render services greater than those rendered by almost any other class of citizens. As members of Parliament they have always been prominent in the direction of the affairs of the Dominion, and in provincial and municipal affairs they have assisted greatly in the development of the local interests of the country.

An interesting illustration of this tendency on the part of lumbermen to take their share of the burden of public affairs is afforded by the city of Westmount, P.Q. No less than four representatives of the lumber industry of the Island of Montreal are prominent in the affairs of the city of Westmount. We take pleasure in publishing herewith portraits and brief biographical sketches of the careers of the quartette.

Mayor William Rutherford.

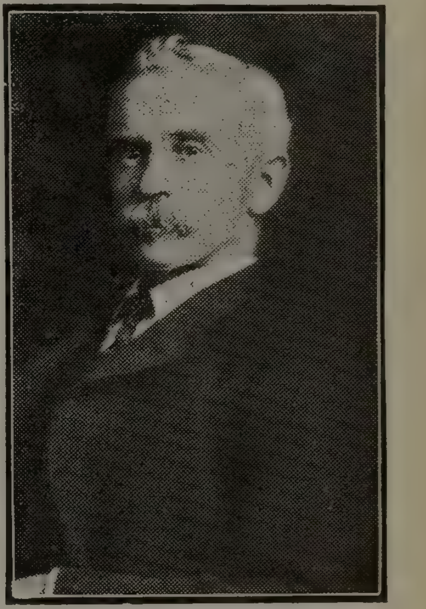
Mr. William Rutherford, Mayor of Westmount, is the secretary-treasurer of the William Rutherford & Sons Company, Limited, of Montreal. Mayor Rutherford's father, the late William Rutherford, started in business in Montreal in 1856 as a lumber merchant and manufacturer. For many years the principal part of the firm's extensive enterprises has been the manufacture of doors, sashes, mouldings and other builders' supplies. Thirty years ago the eldest son became a partner with his father, and about twenty-two years ago the next two sons joined the firm. Ten years ago the present firm name and company management was adopted, with Mr. Thomas Rutherford as president, Mr. Andrew Rutherford as vice-president, Mr. William Rutherford as secretary-treasurer, and Mr. Stewart Rutherford as a director. Mr. Stewart Rutherford is the managing director of the Dominion Box & Package Company, Limited, which has long been under the management of the Rutherfords, and in which they still hold a controlling interest. The family moved to Westmount in 1869 when the municipality was known as Cote St. Antoine. They have resided there ever since, and as they have grown up all have taken a worthy interest in the growth and progress of the place. The late Mr. Rutherford was one of the first councillors in the village of Cote St. Antoine, setting an example for his son, the present mayor, who was elected an alderman in 1908, and has been in the council ever since. The firm has been doing business in its present premises for twenty-five years.

Wm. Rutherford, Mayor of Westmount, P. Q.



Ald. D. H. McLennan, Westmount, P.Q.

J. H. Redfern, Ex-Mayor, Westmount, P. Q.



Ald. W. K. Grafftey, Westmount, P. Q.

Ald. D. H. McLennan.

Ald. D. H. McLennan, president of the McLennan Lumber Company, Limited, of Montreal, is a "Glengarry boy," a title made famous by many noted Canadians. In 1868 he joined the Great Western Railway Company and for some years made his home in Hamilton and London. The Great Western was absorbed by the Grand Trunk in 1883 and in 1885 Mr. McLennan came to Montreal in the employ of that company. Fifteen years ago Mr. McLennan established himself in the lumber business and adopted the motto "Everything in Lumber." He sells hard and soft wods, from mahogany and other imported varieties, to anything in Canadian timbers. In 1905 the business was changed to a joint stock company under the present firm name, doing business at 21 Dorchester street west.

The Westmount elections take place every two years, and Ald. McLennan is just commencing his second term. On the election of Ald. Rutherford to the mayor's chair and office a few weeks ago Ald. McLennan succeeded him as chairman of the road committee.

Ex-Mayor J. H. Redfern.

Mr. J. H. Redfern claims the Isle of Man as his native place. He received his training in the lumber business at Troy, N.Y., and in 1871 became a partner with the late Hon. J. K. Ward, legislative councillor of Quebec province, under the firm name of J. K. Ward & Company. The partnership continued till 1900, when Hon. Mr. Ward ceased his active connection with the firm and was replaced by his son, Mr. J. J. C. Ward. Five years ago the son also withdrew from the concern, since when Mr. Redfern has been carrying on the business alone.

Mr. Redfern was elected to the Westmount council in 1891. At that time Westmount was only a small town, and the mayor was elected by the councillors from among themselves. He remained in the council constantly until 1900, being mayor in 1894 and 1895. Since 1900 he has been a trustee of the public library of Westmount, which became a city in 1908. He occupied the position of chairman of the Library Board of Trustees.

Alderman W. K. Grafftey.

Mr. W. K. Grafftey, managing director of the Montreal Lumber Company, has had 35 years of experience in the lumber business. He was born in Derbyshire, England, in 1849, and his parents came to Canada in 1856. They settled first in Owen Sound, where the son obtained his education and early business training. After being engaged for a number of years in the hardwood business, he took charge of the business of G. A. Grier, lumber merchant of Montreal, with whom he remained for 20 years. In 1897, upon the formation of the Montreal Lumber Company, Mr. Grafftey became its managing director. He has devoted his attention largely to the handling of Ottawa valley pine, although he has had experience in every branch of the trade.

Mr. Grafftey is an alderman of the city of Westmount, and chairman of the light committee. He is a member of the council of the Board of Trade and president of the Montreal Lumbermen's Association.

Canadian Competition Too Strong

"With all the barriers down, our mills cannot stand up against Canadian competition, principally for the reason that wood, whether domestic or imported, costs $5 to $6 per ton of paper more at a United States mill on the average than at a Canadian mill, as the provincial governments own most of the timberlands and practically subsidize the paper industry by bearing most of the 'carrying' charges." International Paper Company's protest to Congress against the tariff arrangement.

Lumber Matters in the Law Courts

Important Case Regarding Responsibility for Freight —Possession of Pulpwood Causes Legal Dispute

Freight and Duty on Machinery.—The importance of having details of agreements for purchase and sale, clearly set forth in black and white was shown in the case of Atkins vs. the Annable Lumber Company, of Trail, B.C., which has just been tried in county court before Judge Forin. The amount involved was small, but the question at issue was of great importance. The suit was entered for the sums of $45.25 and $73.33, which the plaintiffs claimed to be the balance due on a quantity of machinery supplied to the defendants. The defence was that the former sum was an extra charge for freight accrued through the mistake of the Atkins Company and that they were not liable for the $73.33 because this sum was charged for duty and freight on certain machinery brought in from a point in Michigan to Hamilton, contending that the whole shipment was contracted for at a price f.o.b. Hamilton, Ont. The machinery was sold to George Compbell, manager of the Annable Lumber Company at Trail, by W. C. Birdsall, sales agent for the Atkins Company of Hamilton, Ont., and also for the Cogel Manufacturing Company of Benton Harbor, Mich.

In the witness box Birdsall stated that he made the sale in the company's office near Trail. He told Mr. Campbell that he represented both the Hamilton and the Benton Horbar companies and was asked by Mr. Campbell to make up a list of machinery that he, witness, thought would be required in the mill.

This was done, and certain machinery, to be supplied by both the Canadian and the United States Company, was ordered. He produced the order form and explained that the words "plus freight and duty" referred to the Cogle portion of the machinery ordered. He had told Mr. Campbell that the Cogle machinery was all sold at the United States price, plus duty and freight.

Under cross-examination he stated that the words "f.o.b. factory" at the head of the order form meant free-on-board at Benton Harbor and not at Hamilton. A certain delay had occurred in the shipment of some of the machinery which had been due to an error on the part of the plaintiffs. This had resulted in the defendants being charged with some extra freight, due to the difference between carload and small shipment rates.

For the defence, George Campbell, manager of the G. M. Annable Lumber Company, stated that the goods were all purchased f.o.b. Hamilton. The Atkins Company had been given the order because they had a factory at Hamilton, and because the machinery, all bought at eastern prices, could be shipped west in carload lots. Witness said the words "plus freight and duty" placed on the order near two items referred only to those items which Mr. Birdsall had offered to throw in with the order free of any charge except duty and the freight, stating at the time that the order was a pretty substantial one and that he could afford to give these two pieces of machinery free. No mention of American prices had been made excepting in regard to these two items of the order. George T. Newman, also an employee of the lumber company, said that he heard the discussion as to prices, etc., between Messrs. Warner, Campbell and Birdsall, and that he remembered hearing that the two items marked "plus freight and duty" were to be given free of actual cost.

His honor, in giving judgment for the plaintiffs, remarked that these disputes as to contracts between sales agents and purchasers were "an oft-told tale." There had obviously been some misunderstanding and he had to take the most reasonable view. The machinery sold was of a standard make, the company was a standard one and did business on certain definite lines. If the defendants had paid anything above standard prices for the machinery it might have been argued that they had been imposed on, but there was no complaint that the charges for the machinery were excessive. The factory prices of the goods were well known, or should be well known, and there should have been no danger of confusing the Hamilton and the Benton Harbor prices. Judgment was accordingly given for the plaintiffs for $73.33, the other claim for extra freight having been waived.

Possession of Pulpwood.—The question as to the right of possession of a large number of logs, valued at about $30,000 which were cut for the manufacture of pulp by the Imperial Paper Mills Company, of Sturgeon Falls, is came up for trial in the Non-Jury Assize Court at Toronto before Mr. Justice Britton recently.

The plaintiff company claim that the rightful possession lay in the hands of the receiver, Mr. E. R. C. Clarkson, of Toronto, while the defendants, the Quebec Bank, lay claim to the logs under certain securities which they held. "The greater part of the pulpwood was purported to be hypothecated by the defendant bank," according to the statement of counsel for the plaintiffs. Counsel explained that the logs in question had been cut by the Imperial Pulp & Paper Company prior to the spring of 1908, and had been placed in McCarthy Creek, a branch of the Sturgeon River. According to the plaintiffs' contention, as the result of a former judgment by which Mr. Clarkson was appointed receiver, the logs were to be put through the mill and the Quebec Bank's charge was to be met by the proceeds of the product. "Gordon & Company," said the plaintiffs' counsel, "who are co-defendants in this action, acted as agents for the Quebec Bank in seizing the logs. The plaintiffs' contention was that the defendants did not bring the logs down for the purpose of putting them through the mill at Sturgeon Falls, but for the wrongful purpose of selling them to Gordon & Company. We say that having taken possession of the logs they mixed them up with other logs and we were put to great expense in getting them out again."

Counsel for the defendants explained in detail the claim by which the bank was alleged to be entitled to the possession of the logs under the securities held by them. The case is proceeding.

Dismissal of Employees.—The case of Mohr vs. Patrick Lumber Company was recently tried at Nelson, B.C., before his Honor Judge Forin and a jury. H. H. Mohr, plaintiff, brought action for $200 damages for alleged wrongful dismissal. He had been employed as superintendent of the Patrick Lumber Company's mill at Crescent Valley at a salary of $200 per month, and claimed that a verbal agreement had been made at the time of his appointment, under which one month's notice was to be given by either party in case the contract for employment was to cease. He claimed that no notice was given and that as a result he was out of employment for one month. The defendant company stated that no agreement for a month's notice had been made, and that the plaintiff had been dismissed on account of incapacity. They claimed also that the plaintiff had left without notifying them. The jury only deliberated for a short time and decided that there had been no arrangement for 30 days' notice. The judge accordingly gave judgment for the defendant company with costs.

Value of Park Trees.—A case of unusual interest to lumbermen is at present before the Supreme Court of British Columbia, which involves the difference in value of trees when considered as timber and when they are looked upon only as park trees. In the case of Hammond v. McDougal, the plaintiff, who lives on the shores of Upper Arrow Lake, near Nakusp, claims damages to the extent of $5,000 from the defendant, a logger. During the absence of a caretaker of the property named Jamieson, who went to Massett for six weeks, the defendant entered upon the tract and slashed it, cutting down over 200 trees suitable for poles. The claim of the defendant was that the identity of the tract in question was mistaken. While error was admitted, the amount of damages claimed is disputed.

The plaintiff endeavored to show the value of the trees in poles, but the Chief Justice explained that if damage was claimed it must be set forward as damage done to trees in a park or as timber.

The plaintiff's counsel claimed that his client should get damages both ways, but his lordship took a different view. On account of the fact that the plaintiff asserted he had intended to use the property as a permanent home and did not intend cutting down any trees where the ones in question were removed, it was decided to claim damages for the destruction of the park trees rather than merchantable timber. The total value of the tract was given at $10,000. It was said to have originally cost $1,500.

Breach of Contract.—The Alberta Lumber Company, of Vancouver, secured a judgment for $1,298.50 in its suit against A. H. Cole for breach of contract in failing to deliver five million shingles last summer according to agreement. The company claimed $2,000. Last spring the shingle mill owned and operated by Cole was destroyed by fire after he had delivered only 500,000 of the quantity contracted for, and the agreement did not contain a clause barring accidents.

Wood Distillation in United States

During the calendar year 1909 there were consumed in the United States in the processes of wood distillation 1,265,157 cords of wood by 147 plants, as against 977,844 cords by 131 plants in 1908 and 1,282,120 cords in 1907 by the same number of plants. The quantity used in 1909 was 287,313 cords, or 29.4 per cent. more than in 1908, and 16,963 cords, or 1.3 per cent. less than in 1907. The industry, though of relatively small importance when compared with lumber production or even with pulpwood consumption, has shown a similar recovery from the poor business conditions prevailing in 1908. This is noteworthy in hardwod distillation, where it is due about half to the increase in the quantity and the average value per gallon of wood alcohol, and about half to an increased production of charcoal and gray acetate

---

The announcement of a 40-cent rate on lumber from Portland, Ore., to New Orleans, Philadelphia or New York, via the Panama railway, has created a sensation on the Puget Sound, as it is believed to indicate the trend of rates following the completion of the canal in 1914. The all-rail rate from Pacific coast terminals to New York is 75 cents per 100 pounds. The first steamer left Portland on February 21st, and the handling of the first cargo will be watched with deep interest. This interest will be shared by the manufacturers of British Columbia, who hope to benefit greatly by the opening of the canal.

Winter Favored Logging Operations

Reports Indicate That Conditions Were Everything That Could Be Desired—Good Outlook for Spring Trade

The J. D. Shier Lumber Company, Limited, Bracebridge, Ont., in a letter to the "Canada Lumberman," report as follows: "The indications are that the year 1911 will be especially favorable for lumber manufacturers. The winter has been everything that could be desired for getting out stock, plenty of frost for making roads—not too much snow—and labor fairly plentiful at reasonable wages. The result is that the logs are about all out of the woods and watered, and with a good driving season should reach the mills at a minimum cost.

"Lumber stocks at the mills are getting low and while there has not been any material advance in the price of the lower grades, they are on the whole firmer. The nmerous enquiries coming in for all grades show that there is not likely to be any falling off in the building line.

Short lengths in hemlock are about the only weak point. The 16-foot and up sizes are selling readily at a slight advance over last year's prices. As there is a scarcity of the long lengths at the mills, it will necessarily follow that prices will be firmer when the spring trade opens up."

Neil Watson, Mull, Ont, reports that he finds the markets about the same as last year and the supply a little smaller. The short supply has resulted in an upward tendency to prices. The demand is holding good.

Geo. Voght, Adamsville, P.O. Ont., reports that the winter which is just ending has been a banner one for the taking out of logs on the Bruce Peninsula. Prices have been good at the mills and at the dumps, and the mills are now all heavily stocked. Prices are looking good, especially for hardwood. He thinks that the mill men "can pull through for another year."

A. Barnet & Company, Brulé Lake, Ont., report that they are preparing for a good season at their mill and that they will cut about 4,000,000 feet. They have a stock of about 400,000 feet unsold at the present time.

Keenan Brothers, Owen Sound, report that they consider prices very firm and liable to remain so. The supply of hardwoods, they say, is very short at the present time. Keenan Brothers have only one camp in operation, which is at Miller Lake. They are running a mill there, and at present have one million feet of choice hardwoods piled on shore, ready to be shipped at the opening of navigation.

The White Pine Lumber Company, Blind River, Ont., have made about the same cut in the woods this winter as last. They report that the winter has been the best for logging operations that they have experienced in years. The better grades of lumber, they say, are in good demand and bringing good prices, but the lower grades are away off.

Geo. Gordon & Company, Limited, Cache Bay, Ont., report that the work in their camps has progressed favorably. They expected to have all their hauling completed by the middle of the present month. Their cut is a little larger than that of last year. In a letter to the "Canada Lumberman" they report that in their opinion there is a tendency in prices to increase slightly, especially in the lower grades of lumber, as at the present time they are considerably firmer than they have been for some time.

The Pearce Company, Marmora, Ont., broke up their camps early in March. They report that the winter which is just coming to an end has been a fine one for work in the woods. As to market conditions they state that prices are fair, stock becoming scarce and inquiries fairly numerous. They expect to be able to commence sawing early.

Messrs. Ferguson & McFadden are building a larger burner at their mill at Tomiko, Ont. In a letter to the "Canada Lumberman" they state that they expect their sleigh haul to be completed about March 15th.

The Keewatin Lumber Company, Keewatin, Ont., report that the woods operations are moving along nicely, although they have been slightly hampered by snow. They find the demand fair and the supply of pine rather limited.

E. M. Miers, Wiarton, Ont., reports that enquiries have been more frequent of late, and that prices of soft woods are about the same as last year. Hardwoods, he states, are "looking up."

The regulations of the Dominion Government for the administration of timber within the Rocky Mountains, Yoho and Glacier Parks, have been amended by adding a clause allowing the Minister of the Interior to permit the cutting of dry timber in areas of not more than two square miles. The ground rent for permits has been fixed at $20 per square mile, payable in advance; such rental to be applied on account of the dues for timber cut, if such dues equal or exceed the amount of the rental.

Price of Lumber and Cost of Living

So much has recently been written about the increased cost of living, that a letter which was written by Mr. Leonard Bronson, of Chicago, manager of the National Lumber Manufacturers' Association, upon the course of lumber prices during the last thirteen years, is of special interest. Mr. Bronson's letter, which appeared in the daily press, was as follows:

"It is a remarkable fact that, while practically every commodity has advanced in price during the last few years, lumber prices are now lower than they have been at any time, with two or three brief exceptions, for thirteen years. Lumber advanced in price for a few years before the panic of 1907, but at that time took a heavy drop from which it has not yet recovered.

"This relates to prices secured by producers at their mills. For example, the United States Forest Service reports the average price of No. 2 yellow pine flooring in Texas at $9.18 a thousand feet; in Arkansas, $9.42; in Louisiana, $8.83; in Mississippi, $8.07; in Alabama, $8.50. These prices were for July, August and September, 1910, which months the last report covers. The average price at southern mills for No. 3 common boards is to-day about $6.25, as shown by reports to the Yellow Pine Association. No. 2 hemlock dimension is selling at the Wisconsin mills at about $10 a thousand feet, and No. 1 at various prices from $10 to $16. The Pacific Coast is selling ordinary building lumber very low, owing to its distance from the markets. Low-grade boards, scantling, etc., have sold within the last few weeks as low as $6.50 a thousand feet, which is far below the cost of production. The Forest Service reported the mill price of common dimensions in Washington during last summer at $9.37, and prices are now lower than then.

"So in every variety of woods, the ordinary qualities and kinds, which enter into building to the greatest extent, are sold at such low prices at the mills that the producers cannot get back cost of manufacture and the value of their standing timber.

"Some kinds of good lumber are high in price, owing to their scarcity. High-grade white pine lumber cannot be secured in sufficient quantities to supply the demand, and so if a buyer requests clear, wide, thick white pine, which was abundant forty years ago, he must pay what might be considered fancy prices for it; but finishing lumber in western white pine is selling at a moderate price, while common boards are quoted by the Forest Service at $15.94.

"To these prices secured by the manufacturers at the mills must be added the cost of transportation, which may range, according to distance, anywhere from $2.50 to $18 a thousand feet; also the cost of handling the lumber at destination out of cars and into lumber piles, delivery to buyers, and profit to the dealer. These facts are seldom taken into account by the ordinary lumber consumer, who does not realize that where the lumber used 25 or 30 years ago probably was transported an average of 300 miles, now it must be transported an average of not less than 600 miles.

"Now is the time to buy lumber for ordinary building purposes. Building lumber will never be cheaper than it is to-day, and already there are signs that prices will advance. This is inevitable, because the laws of supply and demand insure in the long run goods being sold for more than the cost of making them, and when for a time they have been sold below or at cost the failure of producers and, therefore, the curtailment of product by the shutting down of bankrupt plants will bring prices back to a reasonable basis. Therefore, the home builder in any part of the country is able, so far as the sawmill men are concerned, to secure lumber to-day at prices which are not likely to be duplicated in the future."

Visitor's Welcome

Montreal, March 2.—A visitor to the Montreal office of the "Canada Lumberman," B.34 Board of Trade Building, to-day was Mr. Glidden Campbell, representative of the Campbell Lumber Company, Limited, of Weymouth Falls, Nova Scotia. This company's sawmill and pulp plant were recently destroyed by fire and Mr. Campbell is in this city on a financial mission which, if successful, will enable the company to erect a new and up-to-date pulp mill and possibly to re-establish the lumber mill as well. The intention is to put up a concrete and steel structure that fire can never damage, for the company have great faith in the future of the pulp and lumber industry and they are planning for a permanent plant of extensive capacity. They intend putting in an extra line of grinders so as to increase their already heavy output; also to instal electric drivers for the pumps and wet machines. From their upper mill (No. 1) they can develop two additional units of 3,000 horse power each. The company's present financial situation, Mr. Campbell says, is in splendid condition, their old bonds being fully paid up and the insurance having greatly helped them after their fire loss. Their timber limits are in first class condition as hitherto they have cut only the big timber, leaving the smaller trees for future use. They own three limits on the same river and, with the method of careful handling adopted, their natural supply is practically inexhaustible.

The Retail Dealer and His Problems

Montreal Retailers Organize—Law of Supply and Demand

Montreal Retail Lumbermen Organizing

The retail lumber merchants of Montreal, formerly having membership in the general Retail Merchants' Association, have decided to organize as a distinctive branch of that association under the name of the Retail Lumber Merchants' Association of Montreal. Mr. George Lebel,, of the Lebel & Forgues Company, Limited, was elected president; Mr. William Rutherford, first vice-president; Mr. P. Vincent, second vice-president; Mr. R. Emard, secretary, and Mr. Fred MacFarlane, treasurer. The association will hold their meetings on the second Monday of each month at the office of the general secretary of the Retail Merchants' Association, 80 St. Denis street. About fifty members have joined the new organization.

There has been for some time slight friction between wholesale and retail lumber merchants, not omitting the manufacturer and the contractor. In fact, while wholesalers are occasionally accused of selling on retail lines, the greatest cause for complaint is found in the case of manufacturers who ship direct to contractors, or of firms which do business as manufacturers, wholesalers, retailers and contractors—all in one. How to do away with this "trade anomaly," as it is regarded by those who confine themselves strictly to one department of the business, is the problem the retailers' association have to face. Some members of the association believe that certain limitations could be fixed within which the four classes handling wood—manufacturers, wholesalers, retailers and contractors—should confine their operations.

Law of Supply and Demand in at the Lumber Yard

We all have often been told that a natural law was the one thing we could depend on for uniformity in application and universality in action, says an Old Retailer in the St. Louis Lumberman. When to our eyes there is an appearance of something that is out of balance with the rest of things, the reason is given that it is being subjected to the governing influence of a natural law and therefore there is no escape from its operation. It takes a long while, sometimes, before we realize what it is that is affecting us. Often we attempt to put a halter on a natural law and try to govern it to our own liking, but experience goes to show that the results from it are generally disastrous to the halter and the one who holds it. There are certain governing natural laws in the business world that are as undeviating in their relations of cause and effect as in their physical and spiritual spheres of action. We go on in our pursuit of business unconscious of how these laws are acting upon us, and we are hardly aware by what means they are designated.

About the First Law We Hear Of

There is one of these laws, however, that it is about the first thing we hear of when we first go into business. We have many in the political stump speech; but it always seemed that it affected somebody else other than ourselves, and that there are always a certain number of people who were constantly trying to govern and times heard about the law of supply and demand, as it was declaimed make this law work in their own particular interests. When I first went into business, I learned more about this law than I ever had before. I thought it was a good thing as a whole, and if advantage was taken of it in the right way would prove to be a good thing financially. But a young beginner soon finds that there are many illusions in the retail lumber business; and before many years of my life as a retailer had rolled away, it began to slowly percolate through my understanding that if there was one spot on this earth where the law of supply and demand is inoperative and null and void it is in a retail lumber yard, and more especially in a country town. Nearly everybody who has anything to sell is sensitive to its influence, but the lumber dealer has his own way in dealing with it, and rarely, if ever, is it to his own advantage. As a matter of fact, he ignores it constantly, and suffers himself to be affected by it from the outside; but not until he is practically forced to does he pass its action on himself to others and so keep up its natural balance. The general markets may indicate the raise in prices of several dollars a thousand, but he still keeps on selling at the old figures. He may have all the shingles in his yard that there is in the town, or in the neighboring town, but his prices are the same; they don't fluctuate with the supply or demand either way. Likewise, he may have all the coal there is to be had, but he has not the price, no matter how strong his inclination is to do otherwise. All around him, though, he sees other business men keenly alive to take advantage of a scarcity, even of what are the necessaries of living. Looking over his own grocery bills, he may readily see that different articles fluctuate in price from time to time, and he accepts this as a matter of course. The farmer telephones in to the grain and stock man and inquires the prices for that day on grain and stock. The grocer is asked, also, the prices he is paying for eggs, vegetables and other of like articles for the local market, but he rarely phones in to know the prices for lumber because he has learned by experience that these don't often change, and when he wants them to change all he has to do is to get the prices from one dealer and peddle them around to the others, with the usual result, it is already known to him, of lowering them to his own liking. You see the difference, don't you? On the one hand the farmer is governed by the law of supply and demand and accepts it; on the other, he knows he can control it and he does so.

Lack Of Market Action Suggests "Trust" To Farmer

It is curious how the farmer regards some things. If there is frequent fluctuation in the markets which he sells in, it is the natural way of doing to him and there is no "trust" in the governing of these things, because he believes that one interest is fighting another to "bull" or "bear" the market. But if prices continue the same for a considerable period of time, he begins to suspect that there must be a combination to keep up the level, and if the prices raise on what he has to purchase his suspicion changes to a conviction that the forces of production and selling have combined against him or they would not be able to make the advance. In his buying he does not want to pay any more than anyone else and so, practically, in this particular, he is suited best with a more even level of prices, but when he markets his produce he likes to see frequent changes in the quotations and all of an upward tendency. As a rule, the farmer comes nearer doing business on strictly business principles than does the lumber dealer. 'Tis true, there was a time in the history of the farming interests in this country when the farmer was practically at the mercy of every other interest and they controlled him. But he is rapidly getting out from under such control, and in his own local environment he is now in a position to dictate his own terms in the majority of his business dealings. With that mail order house catalogue in his house, he can go to town and make the merchants sell goods to suit him, or else the rural delivery will bring them to his door, or the railroad to the nearest station from the great supply concerns will deliver the bulkier things that cannot be sent through the mails. If he wants to borrow money to buy up more cattle and hogs to feed, he goes to the bank for the accommodation and gets it at a low rate of interest, for he cannot buy his stock and feed unless he pays the cash for them. But if he wants some extra sheds to shelter them, he goes to the lumber yard and purchases the material and pays for it when he markets his stock and has paid his loan at the bank. If he has made anything out of the feeding speculation, the dealer gets his money; if not, he waits till after harvest.

Lord of All He Surveys

This change in the condition of the farming interests from that of a servant to master, has been instrumental in bringing about a corresponding change in the country retail business of all kinds, but more especially that of the lumber trade. The retail lumberman is forced now to not only compete for trade with his local competitors in the business, but he has also to compete with the lumber producing and other interests for the local demand of the various kinds of stocks he carries. This may seem a rather broad assertion, for we know that the greater part of the manufacturing interests are our friends and will enter into no such kind of competition with the retailer; but this does not alter the fact that enough producers are furnishing the "poaching" element all the lumber and other goods they need in their competition with the retailer for the trade of the consumer, so that it might be said that, in a sense, it makes no difference whether the few or the many are strong enough to keep the dealer continually on the defensive, for it is to him as though the majority of the producers were against him. Twenty years ago we could pretty nearly tell who were the offending parties in this respect among the wholesalers, but to-day we are practically in the dark as to who they are. We know for sure only those who come out openly and admit they do, but what they furnish to the mail order concerns is but a portion of what they obtain from what are known as the "regular" sources, and this is increasing all the time and strengthening the competition with which the retailer in the country has to contend and which compel him to fight for his business existence. Those who are the "regulars" among the manufacturers do not intend to have their products go to the consumer through these "irregular" sources, but they put their goods on the market via the transit car shipment and the jobbers buy them and turn them over to the "irregulars" for a "scalping" consideration. The manufacturer has sold these cars in the regular course of business, perfectly legitimate and all that; he gets his money, which is the prime thing he is after, and, besides, he is often able in this way to get rid of stock that would give him trouble with the regular dealer because the latter would have trouble with his trade over it.

Must Meet Outside As Well As Local Competition

There was a time when the retail lumberman could make a good profit from the sale of sash and doors. He was pretty sure of that, even though he was getting low prices for his lumber sales. He made a good profit, too, from cement and plastering materials, roofing, building paper, paint and other of such side lines as he was handling; but when he puts his prices on these articles now he has to do it on the basis of the outside competition which he knows is lurking around somewhere to trip him up if he gets them too high, according to the opinion of the inquiring and prospective customer. Take the one article of cement, which so rapidly has increased in its use during the past ten years. If there was only a few brands on the market, as there used to be, there would be a better chance of getting a fair profit in handling it. But there has been such a multiplying of the different makes, though practically differing but very little in quality, that it has produced a contention among them to get a foothold in every town in the country. Now it is reasonable to suppose that no one or two dealers in a place is going to handle every brand of cement that is being pushed for sale in that territory, and this makes of every mechanic who uses cement a potential competitor in its sale by the regular dealer. The mechanic has prices quoted him by the concerns who want him to use their product, and even though he is not inclined to break off with the dealer and buy his supplies direct from the factory, yet his human nature influences him to use these wholesale prices to force the dealer to sell him at a price very much lower than would otherwise be the case if the dealer could do as he pleased in the matter. The supply in most everything that is manufactured is greater than the demand for it. The agricultural interests alone may be said to be exempt from this condition. There is hardly anything which the farmer raises now but what the demand for it is greater than the supply, and he is fast getting in the position where he can practically dictate what prices he wants for it. He needs no combination to obtain these, for the whole world wants and must have what he has to sell, and different interests are competing with each other to get it. But for many of the business interests it must be either some form of combination or the process of elimination as one of the inevitable things that must come in the adjustment of the economic forces which are now out of balance.

Bookkeeping In a Retail Yard

At the recent annual meeting of the Wisconsin Retail Lumber Dealers' Association Mr. D. J. Loomans, of Waupun, read a paper on "A Practical System of Bookkeeping for a Retail Yard." Mr. Loomans said:

I think a better title for my paper would have been: "Looman's Method of Bookkeeping for a Retail Yard," but although my method has been in practice for a great many years, it may not seem practical to all my hearers. The ideas are not all my own—I have gathered most of them from my lumber friends.

All our charges are made on a passbook, figured and carried out on the same. The items are then transferred to the ledger. We use the loose leaf form of bookkeeping, and itemize all our accounts on the ledger, using the journal and a balance sheet only. By itemizing everything on the ledger, we have only one place to look for it when we make out bills, and by using a looseleaf ledger, and not having dead accounts in our ledger, it can be handled very satisfactorily. Just as soon as an account is paid and closed it is put in the transfer ledger, which is indexed the same as the regular ledger; and if it is a small account that is closed and we want to reopen it, we transfer the same sheet back from the transfer ledger to the regular ledger. In this way we can transfer back and forth and fill all our ledger leaves.

It has been our custom, and I think it is a good one, always to render a bill when a person comes in to pay. It does not necessarily have to be an itemized account, if the party already has had that, but if they have not had an itemized account and haven't time to wait for it, we give them a receipt and afterwards make out an itemized statement and mark it paid, if paid in full, and send it to them. I think that as a general rule people are better satisfied with this kind of service, and if an error has ben made in figuring any lumber in that bill, we are very apt to detect it by its being itemized.

I might say here that one of the essentials in our bookkeeping is to have our books in such shape when a man comes in to pay his bill we can tell him at a glance what he is owing. We never tell a person that we are busy just then, and for him to stop in the next time he comes by. Our books are always posted up to date, and it does not take us very long to tell a man how much he owes us.

Another very essential point in bookkeeping is not to make mistakes. I think as many customers are lost, who go elsewhere to trade, through errors in bookkeeping, as through any other thing. It is as important to have accounts correct as it is to be a good salesman, and the business depends on it fully as much, especially if the trade is mostly with farmers.

We make a practice of sending an itemized statement to customers as we see fit, but we never let them run very long. I go through my ledger personally the first of every month and check off every account and am never backward about sending statements. After the trade is used to it I think they prefer it, as it keeps them posted on what they are owing. We send our statements on good stationery, typewritten, and are very particular to have them neat and orderly. We balance our books every month, as we think it necessary to know just what we are doing each month.

We figure our profits every day and can tell what our gross profits are at the end of every day, and our net profits every month. We use a regular form to put that on, so that we can compare the profit, expense, amount of business, and so forth, with the previous month, or the same month in the previous year. I am always anxious to compare one month with another. We also have in our ledger what we call a "bad debt account," and put all the bad accounts together, and we do not figure this as an asset at inventory time, but we check this bad debt account over every month and keep thoroughly posted as to whose names are on it, and never lose an opportunity to collect if possible

We also have a "cash error account." We keep that in our ledger the same as any account. In case a person pays an account and is not credited for it properly, when we figure up our cash, just before 6 o'clock, it will overrun the amount that person has paid and has not had credit for. In that way, in a great many instances, it is recalled to the bookkeeper's mind and we can fix it up at that time. But in case that it can not be found we put it in the cash error account and in thirty days when we ask this same party for his account and he claims he has paid it (and he usually can tell what date he paid it) we turn to the cash error account and it is there before us, and not only satisfies us that the party has paid it, but it also satisfies the customer. This cash error account has proved very helpful in rectifying mistakes.

Duplicate Orders.

We use in our business our own duplicate order blanks and all the orders are given on these blanks, and if we give an order to a travelling salesman we always ask him to sign the order. A great many times we write out the order ourselves; in this way we avoid many mistakes. We keep all unfilled orders in a book we have for that purpose and when the order is filled and checked out, we take it out of this book and put it in numerical order in another book. In this way we can always refer to our files and see from whom we bought a certain article and at what price.

We send all of our remittances on our own blanks, never sending the invoice to be receipted, but we attach a carbon copy of this remittance blank to the invoice and put it in our files. We have printed on the remittance blank: "No receipt is required if correct." In this way we never lose any of our invoices. Some firms will send receipts instead of returning invoices, but we wish to file all of our invoices.

It is a good business principle to pay bills promptly, even if one has to borrow the money to do it, as it gives one a better standing with the wholesalers and manufacturers. The banks we do business with furnish us cheque books free of charge, with any advertisement we wish to have on them. We make all remittances in these cheques and mark across the face of them "In Exchange." This practically makes a draft of the cheque and we pay the exchange, and have an arrangement with our bank to pay so much on every cheque. In making remittances we feel we ought to pay the exchange, and not the firm we buy goods of. If we owe a firm $100 we pay them $100 and not $100 less 10 cents exchange.

Collections.

Now I am going to mention the most important part of bookkeeping; that is, to collect accounts and collect them when they are due. Most longtime accounts are the fault of the creditor. If a customer knows the motto of the firm is "Prompt Collection" and knows he can not pay at any time convenient to himself, he will pay when accounts are due. In my opinion prompt collections are a matter of education. I sincerely believe accounts can be collected promptly and pleasantly without injury to the good will of customers. I do not care if everyone else in town gives long time credit, collections can be made promptly and satisfactorily if done in the right way. We art not at all backward in refusing credit to anyone we think is not worthy of credit. In my twenty years' experience in the lumber and coal business I have found with a certain class of trade it is essential to make them pay promptly in order to keep their business. In a great many instances when a party who is not good pay gets enough in arrears so that he has to be crowded for the money, he will quit trading where he is in debt and go to a competitor and pay cash, and there is no way of getting his trade back until the old account is paid up. It is our policy to refuse credit to that class of trade and let them go to our competitor and get all the credit they can, then they will be sure to come back to us and make good cash customers.

Electric Transmission of Power

In this article the subject of transmitting power by means of electric current, in competition with belts and shafting or with rope drives, will be considered as a distinctly separate proposition. It seems to be almost impossible for many of the writers on the subject of electricity, as used for general power purposes, to separate the above-mentioned subject from the following question: Which is cheaper, to produce your own power or to buy it from somebody else? A very little intelligent consideration will show that they are two separate propositions, yet in many cases they are hopelessly mixed, consequently the real searcher after knowledge along these lines is not always able to find what is wanted.

Fig. 1 shows a generator driven by a belt directly from the fly-wheel of an automatic steam engine. The large machine (2) is not far distant from the engine, but, owing to conditions, the former stands at right angles to the latter, hence if shafting and belting were used to transmit power, there would be a considerable loss in transmission, comparatively, because this machine does not require much power to drive it. A right-angle drive of some kind would be necessary, and, although the power required to drive such a device is not nearly as great as some people would have us believe, still, when we remember that the actual power required at the machine is small, it becomes plain that the real loss in transmission would about equal it if belts were used.

A small machine driven by a motor is shown at 3, and it is very conveniently arranged. A larger motor is illustrated at 4, and it drives a line shaft, 5, from which power is taken by belts to run three machines. The whole apparatus forming this part of the illustration is about 12 feet above the floor, hence is entirely out of the way. Where machinery is scattered, as it is in this plant, it pays to instal a motor for each machine for a portion of the works, and use a larger motor to run a line shaft on which there are several pulleys, to drive machines, that can be located in a group, and still prove convenient for the work to be done.

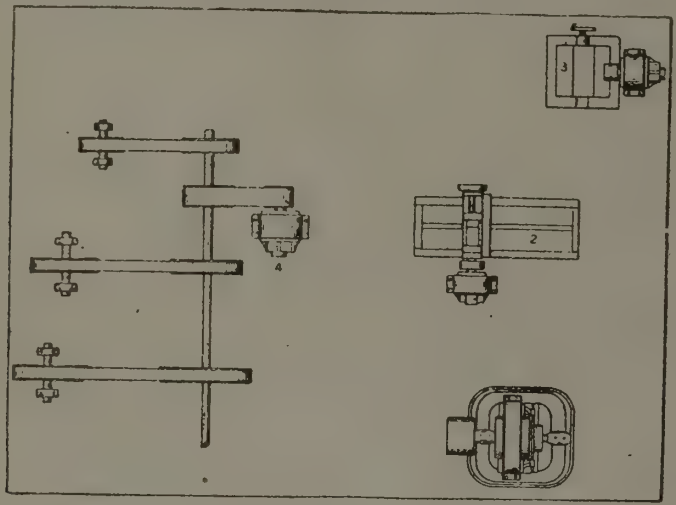


Fig. 1

It is well to remember that every motor should be large enough to carry a normal load without using its full rated power, and with the heaviest load it should not exceed its nominal horse power. Of course, all good motors will stand more or less overload for a short time, but they should not be expected to do it every day.

Fig. 2 is a very compact and well arranged saw and planing mill. The steam engine which drives this mill is not included in the illustration, but a suitable belt on the fly-wheel transmits power directly to a pulley on the main shaft at 2, and power is taken from this shaft to drive all the machines. They are located as actually found in the mill, but loose pulleys, etc., are not shown, as it is not necessary in this case.

When all of this machinery is in use the steam engine indicator shows almost exactly 100 h.p., hence this will be used as a basis for comparison. When the machines are idle, and the engine, shafting and belts are running without doing any useful work, 9 h.p. is developed, therefore, the efficiency of the plant is 91 per cent. No combination of generator and motors can be devised, with our present knowledge of the science, that will give as good results as this belt-driven plant shows. If a generator gives 90 per cent., and the several motors 90 per cent., no better results can be expected, and many electric machines fall below this. But, assuming the very best practical electric generator and motors, their combined efficiency is 81 per cent., or 10 per cent. below the above described belt-driven plant.

The reason for this high efficiency is found in the fact that it was possible to locate the machines near together and still make them convenient in operation. There is absolutely nothing to be charged against these good results, as the belt-driven shavings exhauster not only takes the refuse as fast as it is made, but separates the coarse spruce shavings from the fine ones coming from southern pine, etc., and puts the sawdust in a place by itself. Some of this refuse is sold every month, leaving enough to supply fuel for the boiler, and this is delivered directly into the furnace, thus saving the wages of a fireman. When all the refuse is sold it brings enough to buy coal for the boiler and pay the engineer.

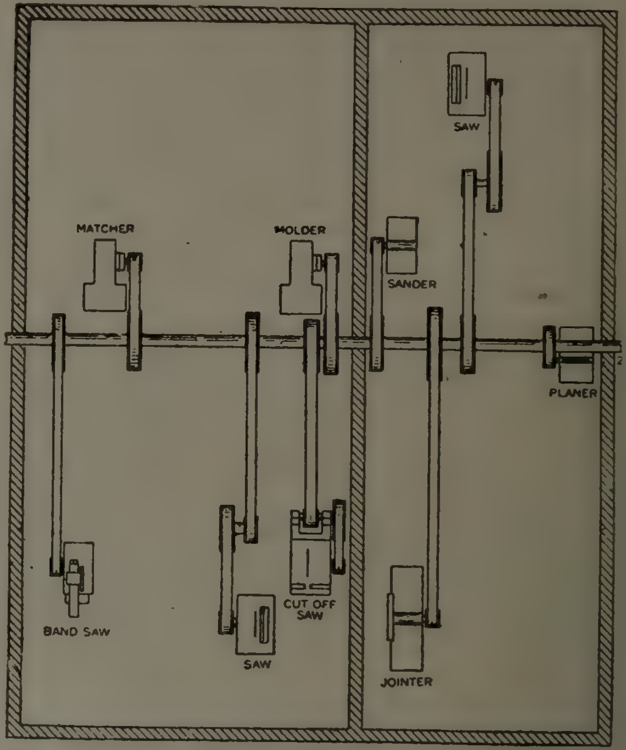

Fig. 2

Fig. 3 illustrates a large machine shop. The boilers and engine are shown because they are located near the centre of the works. There are two belts on the fly-wheel of this engine, both of which deliver power to a main shaft in the mill. Every shaft here is longer than represented in the illustration, because a full representation of their comparative length, and the pulleys on them, would make too

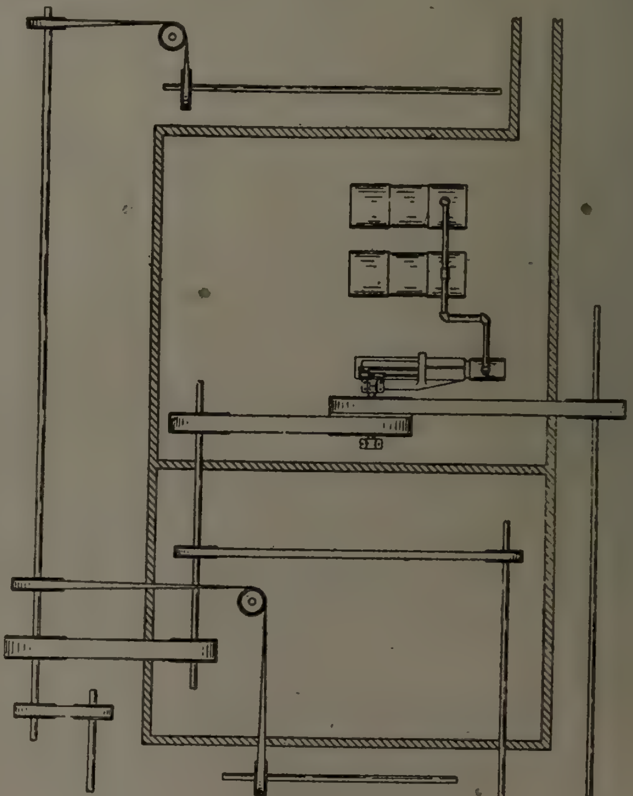

Fig. 3

large an illustration, therefore, although the machinery requiring power is not shown in compact arrangement, it is really scattered still more, hence works at a greater disadvantage. In addition to this, a portion of this shop is two storeys high, and power is used in all parts of it.

The full load of this plant is about 100 h.p., and when all the machines are idle, with the engine, shafting and belts running at full speed, the steam engine indicator shows 41 h.p., therefore the efficiency is 59 per cent. Probably these belt drives will be removed at some future time and electric wires used instead to transmit power from a generator near the engine to the machines to be driven, and if the best kinds of electrical equipment are installed it may be possible to secure an efficiency of 81 per cent., as above-mentiond. If this is accomplished, it will mean a saving of 22 per cent., which is certainly worth trying for.

The point I wish to emphasize in closing is that it is not always safe to say that electric transmission of power is cheaper than other methods, for the simple reason that it may not be a true statement, as it is quite possible to find places where belts and shafting are more efficient and fully as satisfactory in other ways. It is certain that no electric outfit will stand the reckless use, shameful abuse and continued neglect that some belt transmissions receive, yet they are still doing business at the old stand. I am not financially interested in any kind of transmission more than another, but fully believe in full and fair statements concerning all that are mentioned.—W. H. Wakeman, in the Wood-Worker.

Cost Accounting in Panel Making

The cost of producing an article for the market is one of the very first things to be considered. If we don't know the cost, how are we going to make the selling price? I have heard of the selling price being made by a competitor. A customer tells you that he can buy a certain panel at a certain price from your neighbor, whom you know is manufacturing panels, and this price may be $5 per 1,000 feet less than you think it ought to be; but if you haven't a cost system of some kind in your plant, so that you know what that particular panel costs, it's a pretty safe bet that you will say, if my neighbor can make that panel at that price, I can, and you take the order.

This does not seem to me to be a satisfactory way to put a value on an article that you are manufacturing to sell, and it is very seldom, if ever, that a manufacturer who has a cost system will allow a price to be made on an article that he manufactures in this way.

I do not believe that any of us are giving the cost proposition in the panel business the time and attention that we should. It perhaps is possible for a cost accounting system to be carried to extremes, and be made too expensive a proposition, but so far as I know, it has not been overdone by any panel manufacturer.

Each Man Should Have a System.

All of you have, of course, given the cost accounting proposition some thought and, no doubt, have some idea of a system that you can use to advantage in your plant. I believe that each one of us will have to study out a system for our own plant, as a system that works satisfactorily in one plant is not apt to be just the right thing in another plant, although both plants may be manufacturing the same line of goods.

There are different ways of getting your figures together to get the cost of panels; but as long as you include in your figures all of the different cost items, it does not matter what item you figure first or what item you consider last. It is the total of all the items that tells the story.

Several years ago I knew of a manufacturing plant that was being run without a cost system. Perhaps this statement is not exactly correct, for the superintendent of this plant did figure his costs at times. Whenever he felt that he wanted to know what a certain operation was costing, he would time the employees for one or two hours, and at the end of the one or two hours he would count up what had been done and figure out the cost. He, of course, got an accurate cost on what was done during that time; but do you believe that it would be safe to depend on the same amount of work being done each hour for the balance of the day, or for the balance of the week? I am not prepared to say whether there is any manufacturing business in which a system of this kind would be satisfactory or not; but I am prepared to say positively that this way of figuring cost would not be of much value in the panel business.

The system that I recommend is an individual daily time-card system—insisting that each employee fill out a card each day showing the order he has worked on, and just what work he has done on the order. If he worked on more than one order during the day, he should show on the time card the time spent on each order, and if he did more than one kind of work on the order, the time ticket should show the time on each kind of work.

Regular printed forms of daily time cards should be furnished for each department, and these forms should be made as simple and plain as possible.

Some of you may object to the plan I have suggested on account of the time it takes the factory man to make out the time card. It will take a little time to get a system of this kind installed and working properly; but as soon as the men get familiar with the time cards and understand what you wish to obtain from the cards, the time spent in making them out will not amount to much compared with the value of the information to be obtained from these cards if properly made out. In some cases, or perhaps in certain departments of the panel factory, it may be desirable to have a timekeeper to make out the time cards.

I have suggested printed forms of daily time cards, and it seems to me that each manufacturer will have to make up the form for his own plant, making a form that will meet the requirement in his factory.

These daily time cards should be gathered up each day and turned over to your cost clerk, who can compile the day's work and show just what has been done in the factory that day. From these daily time cards your cost clerk can give you costs on each order separately, or he can give average cost for any length of time, both of which I consider desirable.

I am not going to try to give you any figures on any certain order. If I did, after I had finished one order I would want to tell you of another order of a different size, or with little different specifications, that the cost figures were different on, and then another, and so on, until I fear there would be no end. Instead of referring to costs on certain orders, I will give you some average cost figures obtained from a daily time card system, and these average figures are for a period of several months.

To start with, we must have some veneers for our panels. I do not take it that I am to say anything about the cost of rotary cut veneers. Our friends who are running the rotary cutting mills will, of course, furnish us the veneers as we want them, and at a satisfactory price. I say at a satisfactory price, because I recently saw ten quotations from ten rotary cutting mills, on exactly the same specifications, and there were seven different prices on these same specifications, ranging from $3.50 to $5.25 per 1,000 square feet. The most of us ought to find a satisfactory price out of this list.

The veneers that the rotary mill furnishes us, I wish I could say, will all be cut to dimension and ready for gluing; but we will have to take some log run stock in random widths and random lengths.

Keeping Track of Centres.

We will first take the centre stock, which we must work out of the random sizes. This has to go over our centre saws and cut to certain sizes for our panels, and, of course, some of it has to be made up into pieced centres. The man cutting these centres will keep track of the number of centres cut to size, and from the centre cutting ticket we find it costs on an average of 85 cents per 1,000 square feet to size up this random stock for centres. This cost will vary a little on different thicknesses of stock. It costs less to work up the 1/8-inch random centre stock than it does the 1/4-inch random centre stock. This average, you will understand, does not include the handling at the centre saw of any centres cut to size at the rotary mill.

Now, some of the centres that have been made up from pieces must be hinged together to avoid an open joint in centre of your panel after being made up; for this work and the cloth you can figure $1.00 per 1,000 square feet.

If the rotary mill furnishes us face and back veneers in random sizes, we must have a stock cutter to cut out the faces and backs. He gets what he can in on piece and matches up the narrow pieces. This man must show on his ticket just what he has cut during the day, and from his ticket you will find that the cost varies on different woods. On plain woods, not including rotary cut, this cost is 60 cents per 1,000 square feet.

In order to use the stock which the stock cutter has made up from his accumulation of narrow pieces, it must be jointed and put through the taping machine. The jointing and taping, including the tape and any repair work that is necessary, and the gluing of the joint, if it is a face veneer, cost $2.00 per 1,000 square feet on plain veneers.

The veneer mill has, of course, furnished the veneers dried properly for gluing, and we now have the veneers ready for the glue room. There has been some waste in working up this random stock; but I figure that this waste and expense of getting the stock ready for the glue room will be taken care of in the value of the veneer for your panels.

In the glue room we have several men, and it might be well to have a timekeeper to keep the daily tickets in this department. This time card should show the order number, the number of panels glued, the size, the kind of veneers used for each ply, and the time on each order and on each item glued. This card should be signed by each man working in the glue room, and should show the number of hours worked. From this glue room report, the cost clerk will get his glue room charge against each order, and will get the total number of feet of panels glued, and the average glue room labor per 1,000 square feet.

We include in the glue room labor all of the men on the spreader and the press, the help required to get the veneers to the gluing machine and to get the glue ready for use, the labor required to take the panels from the glue room, and one-half of the foreman's time. This gives us an average cost of $3 per 1,000 square feet for glue room labor on a three-ply panel.

Glue Room Cost.

We still have another item to consider in the glue room, which is the cost of the glue. This is an item that will vary a great deal, according to the kind of stock you are gluing, and the condition of your stock, etc. The cost of the glue we will figure at $6.00 per 1,000 square feet for a three-ply panel.

When these panels are properly dried out, they will go to the trimming saw and cut to exact size as ordered. Here we have another daily time card, which shows the work done on the trimming saw during the day, and we place a cost of 45 cents per 1,000 square feet on three-ply stock. In trimming these panels, there is a waste of about 10 per cent. This waste should be taken into consideration in the price charged for the dimension stock ready for the glue room.

Now, we have our panels ready to sand. The sander man has a daily time card, and he reports the number of panels sanded, the size, and whether sanded one or two sides. Here we have a cost for labor sanding of 40 cents per 1,000 square feet for sanding one side of the panel. To this we must add 20 cents for sand paper, making the cost of sanding one side 60 cents. If the panel is sanded both sides, the cost will be $1.20 per 1,000 square feet.

From the sander the panels will go to the inspecting and packing room, where they are all inspected, and the belt sanding done that is necessary, and any repair work that is required, and in this room the crates are made and panels packed for shipping. In this room we find a cost of $1.20 per 1,000 square feet. To this we must add 25 cents per 1,000 square feet for crating lumber and nails.

Our panels are now ready for the shipping clerk to take charge of.

In getting these panels manufactured and through the factory, there has been some labor that we have not included in the items already mentioned. One-half of the foreman's time has not been accounted for, and there is a filer and machine man, an engineer, a fireman and a night watch that we have to settle with on pay day; also some labor cleaning up from the different machines, and some help in the veneer stock rooms, and other miscellaneous items that must be taken care of each day. All of this we will call a miscellaneous expense, and figure an average per 1,000 square feet by taking the total number of feet of panels manufactured. This amounts to $2.50 per 1,000 square feet.

In the several items mentioned we have included all of the factory pay roll, and we have the following for factory labor on a three-ply panel in plain wood:

Glue room labor	$3 00
Trimming	45
Sanding two sides	1 20
Inspecting and packing	1 20
Miscellaneous labor	2 50
Making a total of	$8 35
We add for glue	6 00
We add for crating lumber and nails	25
Total	$14 60

There are other items of cost which the panel manufacturer who manufactures a general line of panels must consider. The figures that I have given for cutting, pointing and taping stock will not apply to a quartered oak proposition. This will have to be considered separately. There is also the two and five-ply proposition to consider.

I will not take up any more time on the factory cost, but wish to say that very satisfactory results can be obtained from these daily time cards on the different operations that the panel man must consider, if the cards are properly used.

Besides our factory cost, there is another item that we must consider in figuring our cost. This is a general or fixed expense account, including mill supplies and miscellaneous items required for operating, repair account, fuel account, interest account, insurance and taxes, office expense and salaries, selling expense, depreciation on plant and machinery, and an occasional loss on account receivable. By taking the total of these several items, and taking the total number of feet of panels manufactured, this can be figured per 1,000 square feet, the same as the other items we have figured, and for the sake of carrying this cost proposition through on a three-ply panel and on a per 1,000 square feet basis, we will estimate this fixed or general expense at $6.00 per 1,000 square feet.

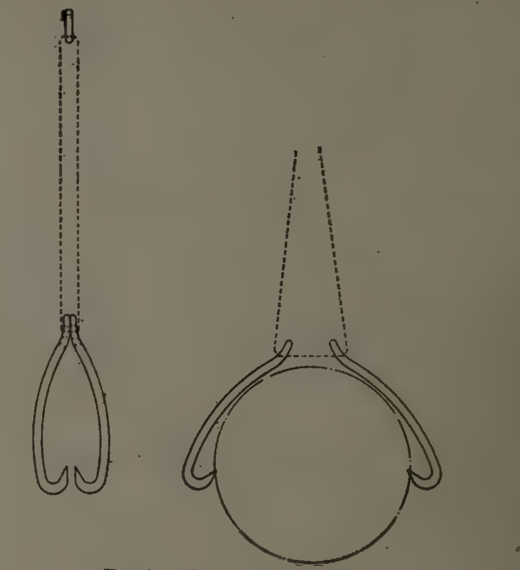
Next, we must add the cost of our veneers for the centre, the face and the back.

And now, after all of this work, and after taking all the chance that we have in building this special stock, are we entitled to a fair percentage of profit? I believe that we are; but I will leave it to you to add the percentage of profit.

And then I will ask you one question. What is the percentage of profit on any three-ply panel that is sold at 3½ cents per foot or less, and in some instances with freight allowed?

Useful Sawmill Devices

For the purpose of lifting round logs on to rack benches or timber frames, a suitable device is necessary for carrying out this operation quickly. If the logs come into the mill, drawn up by an endless chain, they rest on the floor, and there is no way of passing a sling chain under, or if there were, this would take a longer time, than the hooks shown in fig. 1. These are made from a good class of 1½-inch x 1½-inch iron, and a ⅝-inch chain goes through the eye of each and through the ring which is attached to the travelling crane hook overhead. Fig. 2 shows the hooks gripping the log, which slide or adjust themselves on the ⅝-inch chain, as in the sketch. The hook points are sharp and hardened, so that they dig themselves into the log, when the slack is hauled up.



Device for Lifting Logs

There are various methods for loosening and removing rusted-on pulleys from shafting. Usually heat and oil are applied and some hammering is done. One thing to be mighty careful about is the hammering, because the vibrations from hammering on the hub of the pulley often break the spokes between the hub and the rim. One of the best things to do is to use a wooden block as a drift and cushion between the hammer and the pulley; this lessens the shock some and it is not quite so likely to cause breakage.

Up to the present the expert chemists in charge of the United States government laboratory at Warsaw (Wis.), have been unsuccessful in their efforts to discover a suitable substitute for spruce in the making of news print. So far their researches have cost $30,000.

Economical Use of Wet or Green Sawdust, Bark, Chips and Other Refuse as Fuel

There are many fuels that require forced draft to make them practically available, as natural draft does not cause them to burn with sufficient rapidity to make steam fast enough, except by putting in a prohibitive number of boilers. This is especially true of sawdust, bark, chips, and other saw mill refuse, which usually come from geen logs, and, very frequently, from logs that have been in the water a long time.

An effectual remedy for this condition is the Gordon Hollow Blast Grate, manufactured by the Gordon Hollow Blast Grate Company, of Greenville, Mich., except for the States of Washington and Oregon, where it is manufactured by the Puget Sound Machinery Depot, of Seattle, under license from the Gordon Hollow Blast Grate Company. This grate is far from being an experiment, having been on the market, first in its original form and then in its improved forms, for twenty years, and having been tested under all kinds of conditions in all parts of the world, so that its value is definitely established.

First and foremost, it will produce as good results with wet, green or frozen sawdust as a draft grate gives with dry wood. Second, with the same fuel, it will add from 25 to 50 per cent. to the volume of steam generated in a given length of time. Third, it gives the fireman perfect control over the fire, enabling him to graduate it according to the power required, and making him absolutely independent of the weather. It also saves labor in firing. Fourth, the blast keeps the grate bars cool, causing them to last indefinitely.

The manufacturers do not ask the purchaser to take anything for granted. They offer to ship any responsible party an outfit for his furnaces or ovens on approval, he to have thirty days after installation in which to test it in any manner he may see fit. His decision in the matter is final. If he does not consider that it would pay him to keep the outfit, he is under no obligation to do so. In case of rejection the company pays the freight both ways.

WANTED & FOR SALE DEPARTMENT

PUBLISHERS' NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Employment Wanted" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies.

Advertisements of "Employees Wanted" will be inserted at the rate of two cents a word net. Cash must accompany the order.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

WANTED—LUMBER, ETC.

HAVE YOU ANY STOCK WHICH YOU wish to sell? If so, make the fact known to probable buyers by placing an advertisement in the Wanted and For Sale Department. Address CANADA LUMBERMAN, Toronto.

Basswood and Elm Wanted

1" BASSWOOD, DRY, WIDE, AVERAGE width. 1" Elm, dry, wide, average width. Mill culls out. Write Palmer Lumber Co., Kemptville, Ont. 3-6

Pump Squares Wanted

WE REQUIRE 5" x 5" AND 6" x 6" QUARTER cut White Pine Pump Squares Good price for the right material. ONTARIO WIND ENGINE AND PUMP CO., LIMITED, Toronto, Ont. tf.

Rock Elm Logs Wanted

WE WOULD LIKE TO COMMUNICATE with parties who could ship us Rock Elm Logs, 15 and 16 feet long. Address JAMES SHEPPARD & SON, Box 309, Sorel, Que. 4-7

Basswood Lumber Wanted

WANTED ABOUT 100,000 FEET DRY, White, 1" and 1¼" Quote lowest cash price for log run. 1's, 2's, Common No. 1 and 2. Box 212 CANADA LUMBERMAN, Toronto, Ont. tf.

Lumber Wanted

PINE, HEMLOCK, SPRUCE, AND HARDwood lumber of all kinds. Will contract for this season s cut. Highest Cash price. Leak & Co., Aberdeen Chambers, Toronto, Ont. 4-7

WANTED

ONE TO TWO MILLION FEET OF BASSwood, Elm, Ash Pine and Cedar logs and ties delivered to Georgian Bay, on North Shore or Manitoulin Island. State price and quality expected. Box 177 CANADA LUMBERMAM, Toronto, Ont. 1-tf.

MISCELLANEOUS

Mill and Timber for Sale

1100 ACRES, WELL TIMBERED WITH birch, hemlock, pine, basswood, spruce and cedar, together with new lumber and shingle mill, steam feed, large frame boarding house close to mill, situated on railway siding. Must be sold to close a partnership. Excellent opportunity for small mill man whose supply of timber is cut out and is looking for a new location. Stock of certain length now in yard. Get busy, this is a snap for some one. For further information apply to Box 531, Orillia, Ont. 6

TENDERS FOR PULPWOOD LIMITS.

Tenders will be received by the undersigned up to and including the 10th day of April next, for the right to cut pulpwood on certain areas situate:

(1) On the Abitibi Lakes and River tributary to the Grand Trunk Pacific Railway, and Northern Ontario Railway, in the District of Nipissing.

(2) On Rainy Lake and around the shores of Lower Manitou Lake, tributary to Fort Frances on Rainy River, in the Districts of Rainy River and Kenora.

Tenderers shall state the amount they are prepared to pay as a bonus in addition to dues of 40 cents a cord for spruce, and 20 cents a cord for other pulpwoods, or such other rates as may from time to time be fixed by the Lieutenant-Governor-in-Council, for the right to operate a pulp and paper industry on or near the areas referred to. Such tenderers wil be required to erect mills on or near the territories and to manufacture the wood into pulp and paper in the Province of Ontario.

Parties making tenders will be required to deposit with their tender a marked cheque, payable to the Treasurer of the Province of Ontario, for ten per cent. of the amount of their tender, to be forfeited in the event of their not entering into agreement to carry out conditions, etc.

The highest or any tender not neressarily aucepted.

For particulars as to description of territory, capital to be invested, etc., apply to the undersigned.

F. COCHRANE,
Minister of Lands, Forests and Mines.
Toronto, Ont., Jan. 10, 1911. 3-7

Spruce Limits for Sale

FOR SALE 400 SQUARE MILES QUEBEC Spruce Limits, with mill sites, powers, etc. For further particulars address Box 241, CANADA LUMBERMAN, Toronto, Ont. 6-6

For Sale

OVER THREE HUNDRED THOUSAND acres of the finest mixed timber in Ontario, consisting of hemlock, cedar, spruce, basswood, black ash, balsam, elm, tamarac, birch, maple, beech; also considerable pine. This timber can be bought in block of from 1,000 to 10,000 acres. There are several good mill sites on the property, good water privileges and good railway accomodation. This would be a chance for parties already cut out and looking for a new location. For further particulars apply to the owners.

THE CANADIAN LAND & IMMIGRATION COMPANY of Haliburton, Limited, 79 Adelaide St., East, Toronto. 5-6

Japanese Hardwoods.

It is authoritatively stated in Yokohama that the exportation of hardwood logs and railway sleepers from Hokkaido, Japan, which was in augurated in 1896, has attained a rank next to fisheries and agriculture in industrial importance. The shipment df oak logs from that port began in 1901, the total annual export during the years since varying from 300,000 feet to 600,000 feet board measure, furniture manufacturers on the Pacific coast being the most ready buyers. The first shipment of oak railway sleepers was sent to Mexico in 1906. Pine and mixed hardwood logs were sent to Australia that year. Oak logs and lumber for the use of furniture and railway car manufacturers were exported to Europe in 1907, in which year exportations of logs increased to 4,000,000 superficial feet. On account of the high prices for fir lumber caused by the demand for building material in San Francisco, the number of superficial feet of sleepers increased to 46,000,000. At present the supply is smaller than the demand, exporters frequently being unable to secure steamers for this trade. The tendency is toward a 10 to 15 per cent. increase in prices.

Lumbering in Mexico.

The promoter of the Durango-Llano Grande Railroad is building in Durango, Mex., saw and planing mills for manufacturing furniture, sash, doors, and boxes. The sawmill will have a capacity of 250,000 feet of lumber daily. The company owns a large tract of timber, principally pine, with some oak, reached by the new railroad. The road is well on its way toward completion and by September, 1911, it is expected the rails will be laid. The lumber will be freighted to the mills in this city to be manufactured.

The Government concession for the erection of this plant carries with it exemption from taxes for a number of years. American machinery, some of which has already been contracted for, will be used. The lumbering operations in conjunction with the mills will give employment to several hundred men.

The new Durango-Llano Grande Railroad will have its present terminus on the Llano Grande Ranch, owned by an American corporation. This is being built for the express purpose of tapping the timber lands of the Sierra Madre Mountains. Upon the Llano Grande tract of 26,000 acres there are thought to be 50,000,000 feet of timber, squaring 6 inches or over. The owners have contracted for the sale of this timber, and a plant for the manufacture of lumber and box shooks will be erected as soon as the road is completed. Machinery for the new plant will have to be purchased.

Proper Angle of Teeth for Circular Saws.

The front angle of the teeth of circular saws has a great deal to do with the cutting qualities of a circular saw, says "Timber News." We believe in a very acute angle for the front of all teeth of circular saws that are used for sawing soft timber. For sawing hardwoods less angle. A great deal of power is used to drive circular saws that have teeth almost upright, saws that are used for ripping and deeping purposes. The only disadvantage of having acute angles or rake to the front of the teeth of circular saws is that the wood is not sawn so clean, but in most cases this does not matter, as the wood will be used in its rough state, or it may be planed after it is sawn. The saving in power and sharpening—for such saws will work twice as long as those sharpened with almost upright teeth—will make it to your advantage to alter the teeth of your saws to those described.

Handling Saws for the Slasher.

I have a slasher built in a steel frame. The saws have to be let down from the top, and to change these eleven saws is quite a job, and risking to the fingers—the least slip means a cut hand. From the top of the mill frame I suspended a 2x10 lengthwise of fthe slasher frame, and on the face of this secured a length of 1-inch pipe, drilling holes each 3 feet, and only from one side. In these holes is placed the point of a hook, which is secured to the 2x10 by nails. This gives me a runway for a trolley, from which is suspended a small block and falls. Now, the saws are picked up from a standing position on the floor, run along to the right place, and lowered into position with little effort and no risk.—H. J. B.

South African Box-making Woods.

The Acting Conservator of Forests in Natal furnishes a memorandum on the box making industry in South Africa, which states that much wood for fruit boxes is at present imported in the form of bundles of boards; the wood chiefly used for this purpose is spruce, coming from Sweden. None of the indigenous woods of South Africa have been found altogether suitable for box making. Black wattde is used in Natal, and pinus insignis has been introduced and has been found to grow well and to be suitable for box making.

I was boring a 1½-inch hole with an expansive bit in a dry hard maple timber, and it took a good deal of muscle to keep the bit turning. A carpenter passed and advised me to turn the cutter of the bit in the same direction as the handle of the brace, and stand with the grain or length of the stick. The result was that it lengthened the strain of the cutting a good deal and taught me a new wrinkle for my memory scrap-book. He explained that the hardest part of the cut, across the grain, is made while you have the greatest leverage on the brace. Simple? Yes, but it is often the simple things that help over tight places. Try it that way next time.—J. B. H.

SAVE TIME AND TROUBLE!

SHIMER CUTTER HEAD

The Shimer Cutter Heads

Are especially adapted to the wants of those who work cross-grained and knotty lumber.

It has been demonstrated many times that monies invested in a small outfit of the Shimer Cutter Heads will save their cost within a few weeks use.

Every time your foreman sharpens an old-fashioned Door, Sash, or Coping Bit he must carefully bring it back to the proper cutting shape, consuming a considerable portion of his time. Usually a high priced man is thus fastened to details when his service could be handled to better advantage if using the Shimer Cutter Heads especially fitted to your patterns.

These tools being made per order, carry in their outline the perfect counterpart of the work, thus by simply filing the Bits and setting them to the gauge, the fitting of the manufactured parts is assured.

The difference in the expense items will soon save the cost of the tools.

Look for the NAME and TRADE MARK "The Shimer Cutter Head" stamped on every Head we turn out. A dealer who would sell you an imitation means to deceive you—send them back and demand the genuine article with our guarantee for your protection.

Samuel J. Shimer & Sons
Branch of Milton, Pa. Galt, Ontario, Can.

Review of Current Trade Conditions

Ontario.

The lumber trade of Ontario is rather quiet at present. Travellers who have visited retail dealers throughout the country, report that at present there is a decided tendency to play a waiting game. There is an almost entire absence of speculation on the part of retailers, and purchases are for immediate requirements only. The retailer naturally is the last man to respond to the impetus of trade improvement, for although one would expect him to be the first to appreciate a betterment in the general demand of the country, he is so placed he can afford to take very little risk. Of late years he has shown an increasing tendency toward conservative methods and a natural result is that at seasons like the present when an improved demand is confidently expected by other branches of the trade, and when last year's stocks are fairly well cleaned up, the retailers hesitate before embarking upon a policy of increasing their demand for the approaching season. There is, however, even at present, a slight improvement to be noticed in the movement of stocks.

Wholesalers and manufacturers are feeling no anxiety whatever, and are maintaining prices firmly, as they believe that as soon as the spring demand opens up there will be no difficulty whatever in disposing of stock at good prices. An indication of this is afforded by an instance recently occurring in connection with a large manufacturer. For his white pine mill culls he was offered, about a week ago, 50c. a thousand more than he was accepting six weeks previously. He refused the offer, which was for quite a lagre block. While mill culls are strong, the higher grades are also extremely firm. Stocks of the higher grades are, in fact, almost entirely off the market.

Reports on the hemlock situation are rather contradictory. In some quarters one hears of an improved demand and firm prices, together with a reduced output, especially from mills at points in the northern States. Other reports, however do not encourage this belief. For instance, an Ohio dealer states that he bought several million feet of hemlock recently at $11 for No. 1, and $6 for No. 2. On a $1.75 freight rate, this could be shipped to Sarnia or other western Ontario points at about $12.75 for No. 1 stock. Georgian Bay mills at present are asking $13 at the mill for No. 1, and with freight at about the same figure, they would be some $2 above the price above mentioned. Stocks of last season's hemlock are fairly light. It is not long, however, before new stock will be available. The new stock is used particularly for special bills and generally brings pretty fair prices. It is expected that orders of this nature will be fairly plentiful, but the long lengths are growing scarcer and it is likely that the bulk of these orders will be filled on the other side.

Spruce is reported firm and scarce. The same applies to shingles and lath. Inquiries from the United States are still rather scarce so far as large blocks of lumber are concerned. A fair number of inquiries for small lots are reported.

Reports from Ottawa indicate that the retail demand is rather dull in eastern Ontario. The very cold winter has interfered greatly with building operations, and purchasers who have given orders for lumber are delaying about taking out stocks. Mill cull stocks are quite active and prices have stiffened. Box lumber is strong and holders are asking higher prices. Lath are strong at Ottawa, No. 1 selling at $4 and No. 2 at $3.25 to $3.50.

Eastern Canada.

Good reports of the winter's logging conditions are received from many parts of eastern Canada. So far as trade is concerned, matters at present are rather quiet, but there is a general feeling that the prospects for the immediate future are better than they have been for some time. The indications are that there will be considerable improvement in the demand from Great Britain. Better things are also expected from the United States, once the reciprocity situation is cleared up. Spruce manufacturers are holding firmly and are confident of improvement.

Prices of eastern spruce at Boston are rather variable, with little trade being done at the high figures. Some manufacturers are asking $23, though recent sales have not been at prices higher than $22.50. A fair amount of new business for random is reported. The trade in spruce covering boards is quiet. Shingles and lath at Boston are firmer than they were a few weeks ago, and manufacturers feel confident that when the spring demand commences, they will get higher prices. Cedar extras are quoted at from $3.25 to $3.40. The market for lath has been rather quiet. Prices for 1⅝-inch range from $3.65 to $3.75, and 1½-inch at from $3.35 to $3.40.

The demand for hemlock at Boston has been rather quiet, as buyers do not seem inclined to increase their stocks. Holders, however, are rather firm, and are not offering any concessions. Eastern and northern clipped boards have been selling at $19.

The trade in eastern spruce at New York continues in fair proportion and manufacturers are expecting satisfactory trade throughout the year. The indications are that the manufacturers will be making only a normal cut.

There is a good call for hemlock at New York for building requirements, a large proportion of the business coming from the suburban sections. Prices in general are firm and the situation is considered satisfactory.

Great Britain.

An encouraging improvement is reported in the demand for soft woods at the principal importing ports of the United Kingdom, the belief being general that the improvement in the trade of the country, which commenced nearly 18 months ago, has finally commenced to be felt by the timber trade. The market for spruce at London is feeling the benefit of the change. Recent sales have brought out a good demand and in a number of cases better prices have been secured. Dealers also are successfully asking for higher prices. This improvement is accompanied by increased consumption, with a consequent reduction of stocks. The situation has been assisted materially by the rather small arrivals of spruce. Generally speaking, there is a much more optimistic feeling throughout the lumber and timber market than has been noticeable for many months.

An increase in the consumption of spruce and pine and also of floorings is reported in the counties of Lancashire and Yorkshire, as the result of increased orders from inland towns. This is accounted for partly by the improved consumption and also by the awakening tendency on the part of dealers to lay in stocks. Much the same condition prevails in the Midland counties. Recent arrivals of spruce from St. John and Halifax have been quickly sold at Liverpool. A good business for deals is reported from Manchester, and floorings also are moving well. Throughout the Manchester district there is at present an extensive consumption of boards, deals and battens. Stocks of Canadian pine deals are held very firmly.

An improvement is also reported in the demand for boards and deals at Cardiff. Pit wood of the heavier kind and pit props are selling in large quantities, the coal mining industry of South Wales being the principal source of demand

The timber trade on the Tyne is benefiting from the increased activity of important local industries. Prices have hardened and stocks are moving rapidly. Pitch-pine is in good demand at better prices. The ship building ports of the northeast are consuming increased quantities of timber. The spruce market at Glasgow is rather quiet, but there is a fair demand for pitch-pine, yellow pine, quartered oak, ash logs, and teak. Stocks of birch at Manchester and Liverpool are small and the demand continues strong. A greatly increased demand is reported for railway carriage stock, which includes pitch-pine, rock elm, oak logs, red and white deals, mahogany, walnut and wainscot oak.

United States.

The approach of spring is bringing with it the customary gradual improvement in the consumption of lumber in the United States. A fair start has already been made in most of the large cities, in the matter of building, the total having considerably increased. This has brought about an improvement in the market for southern pine. The better grades of white pine are rather scarce at some of the interior cities, Pittsburg, for instance. Nos. 4 and 5 boards are scarce in Wisconsin and Minnesota, but a good supply is reported of the ordinary coarse grades. Hemlock lumber in Wisconsin and Michigan, and at lake ports generally, is meeting with considerable demand at present prices, although at Buffalo it is still rather slow because stocks are plentiful, and building is rather backward.

A fair movement is reported in hardwood lines, the best reports coming from West Virginia and upper Ohio points, Memphis and Michigan. Sales of hardwood at Cincinnati have been rather slow, but inquiries are numerous. Oak continues to be the market leader, both in white, plain and quarter sawed. Plain oak is in better demand at Chicago than quarter sawed. There is a fair trade in red oak and red and white mixed. Among the northern woods, maple continues the leader, with birch a good second. A prosperous season is predicted in Michigan hardwood circles and the trade at present is reported to be good.

At Buffalo, stocks of low grade northern pine have been arriving plentifully, but prices are maintained at about the same level as a year ago. No advance, however, is looked for. The better grades are scarce. There is a better inquiry for hardwood at Buffalo and some fair sales are reported. Maple is very firm and stocks are inclined to be small. The price of good birch continues strong and stocks are light. Plain and quartered oak are holding their own. Easier prices are reported for hemlock at Buffalo. Yellow pine is fairly active, with prices rather firmer than earlier in the year. There is a firmer tendency in the Buffalo market for red cedar shingles and stocks are lighter. The heavy receipts during the past season have been pretty well absorbed by the winter demand.

Advanced Prices at Ottawa

Ottawa, March 10.—That the price of lumber has advanced in Ottawa during the past year is indicated by the increase in the prices of the lowest tender for the city's supply for the coming year, to take effect on April 1st. The lowest tenderer last year was W. H. McAuliffe, and the lowest this year is the McAuliffe-Davis Lumber Co.

The prices and quantities for the two years were as follows:

White or red pine planks.	1910 per M ft.	1911 per M ft.
2-inch x 10-inch, 13 or 16 feet	20,000 ft.—$20.	30,000 ft.—$22.
2-inch x 11-inch, 13 or 16 feet	20,000 ft.—$20.	30,000 ft.—$22.
2-inch x 12-inch, 13 or 16 feet	20,000 ft.—$20.	30,000 ft.—$22.
3-inch x 10-inch, 13 or 16 feet	10,000 ft.—$21.	10,000 ft.—$22.
3-inch x 11-inch, 13 or 16 feet	100,000 ft.—$21.	80,000 ft.—$22.
3-inch x 12-inch, 13 or 16 feet	10,000 ft.—$21.	10,000 ft.—$22.
3-inch x 10-inch, 5 or 6 feet	10,000 ft.—$20.	20,000 ft.—$21.
3-inch x 11-inch, 5 or 6 feet	50,000 ft.—$20.	50,000 ft.—$21.
3-inch x 12-inch, 5 or 6 feet	10,000 ft.—$20.	20,000 ft.—$21.
1½-in. x 7-inch, 13 or 16 feet	5,000 ft.—$15.	10,000 ft.—$20.
1-inch x 10-inch, 13 or 16 feet	10,000 ft.—$18.	10,000 ft.—$21.
1-inch x 11-inch, 13 or 16 feet	20,000 ft.—$18.	20,000 ft.—$21.
1-inch x 12-inch, 13 or 16 feet	50,000 ft.—$18.	50,000 ft.—$21.
1-inch x 7-inch, 13 or 16 feet	10,000 ft.—$15.	20,000 ft.—$21.
1-inch x 6-inch, 13 or 16 feet	20,000 ft.—$18.	20,000 ft.—$21.
1-inch x 4-inch, 13 or 16 feet	5,000 ft.—$15.	10,000 ft.—$21.
Spruce Planks—		
2-inch x 10-inch, 13 or 16 feet	20,000 ft.—$19.	20,000 ft.—$21.
2-inch x 11-inch, 13 or 16 feet	20,000 ft.—$19.	20,000 ft.—$21.
2-inch x 12-inch, 13 or 16 feet	20,000 ft.—$19.	10,000 ft.—$21.
Cedar—		
6-inch x 6-inch, per lineal foot	20,000 ft.—5c.	20,000 ft.—6c.
7-inch x 7-inch, per lineal foot	10,000 ft.—6c.	20,000 ft.—8c.
8-inch x 8-inch, per lineal foot	20,000 ft.—7c.	20,000 ft.—9c.

The very cold winter has evidently had its effect in delaying building operations in all parts of eastern Ontario and farther afield Manufacturers state that firms which purchased their stocks of mill culls and other of the poorer grade lumber for domestic use have been very slow in having it shipped out. This would indicate that there has not been much demand from the retailers during the cold winter. Manufacturers state further that there is a growing tendency on the part of purchasers to delay taking away the stocks they have purchased, preferring rather to leave the lumber in the manufacturers' yards until such time as they want it. There is a belief that prices will be stronger although wholesalers are not inclined to buy more than they want for immediate orders.

The greatest activity is in mill culls and prices are somewhat advanced. Many companies are willing to buy them now, payable in 30 days, but not to be delivered until summer. This would indicate that an upward move is anticipated in this line. Box lumber is being held at an advance of from $1 to $2 a thousand, but is not selling very much. There is a tendency, particularly among American buyers, to substitute inferior lumber for boxes, to the customary pine and also to use mill culls for this purpose as well. The general opinion seems to be that mill culls will advance to almost the price of box lumber and that in the future there will not be as big a difference in the prices of the two classes.

Lath are much stronger than they were and there is a slight increase in the price. No. 1 lath is selling at around $4 per thousand pieces, and No. 2 from $3.25 to $3.50. Shingles are still very slow.

The low water above the Chaudiere Falls has greatly impeded operations among the mill men there. J. R. Booth is using very little power whatever and the E. B. Eddy Company has had its power reduced 80 per cent. It is expected that this will be the last winter that there will be this trouble, as the dams being built up the river will conserve the water sufficiently to overcome the scarcity. It has been years since the water was so low in the Ottawa river as at present. The long winter, with little or no break, was chiefly responsible for this. Word has been received from Lake Temiskaming that the water is raising there and it is expected to be felt here in a couple of weeks.

There is considerable expectancy as to what will be the result of the dams up the river as far as the operations of the Upper Ottawa Improvement Company, which brings the logs down the river, are concerned. There is a coffer dam at the foot of Lake Temiskaming already constructed, and it is anticipated that it will delay operations somewhat in getting down the logs.

Along with the general activity in commercial business, woodworkers are receiving many orders this spring. The E. B. Eddy Company anticipate a very active summer and furniture concerns, etc., are all well supplied with orders.

Greatly Improved Demand in Great Britain

Liverpool, Eng., March 4.—An improvement in the demand for soft woods is noticeable at the larger ports of the United Kingdom, and shows that the improvement which has been in progress in the general trade of the country for nearly eighteen months, has at length reached the timber trade. At London the demand for spruce has improved and quantities offered in recent sales have sold readily and in some cases at higher prices. Higher prices are also being asked by dealers. The actual consumption has improved, and stocks have been reduced, though this is attributed in part to the small quantities of spruce which have arrived by liners. A more cheerful feeling prevails in the market as it is known that the general trade of the country is flourishing and that the timber trade must benefit through this.

In Lancashire and Yorkshire the consumption of spruce, of pine and of floorings has increased. More orders are reaching merchants at the ports, from inland towns, and there is a disposition on the part of dealers in country towns to show more enterprise in the matter of laying in stocks. More wood is certainly being bought, by inland buyers, but a sufficient explanation of this is found in the improved consumption in the two large counties named, and in other counties in the north and midlands of England. At Liverpool, business has improved appreciably. The recent arrivals of spruce by liners from St. John's and Halifax, have been on a small scale, and have found ready buyers. At Manchester, good business has been done in deals and floorings, and holders have become firmer in their demands, and are not disposed to part with stocks except at prices which represent to them full present values. A large consumption of boards, deals and battens is now in progress in the Manchester district, and is making itself felt both at Liverpool and Manchester. Lumber, generally, is in improved demand in both of these ports of the northwest. Prime wood meets with a ready sale, and numerous inquiries for such wood are coming to hand. Stocks of Canadian pine deals are now held very firmly.

At Cardiff, the recent buyings show an improved consumption of boards and deals in the district, and also a very large consumption of pit-wood of the heavier kind, and of pit props. Wood of these sorts continues to be imported in large quantities and one might well wonder where a use for it all could be found. The vast coal mining industry of South Wales draws its supplies of wood very largely from Cardiff, and no material used in the industry is more strikingly in evidence than the wood and props which are imported for mining purposes. The recent importations have been heavy, but the wood has gone steadily into consumption.

On the Tyne there has lately been increased activity in the more important local industries, and the timber trade is feeling the benefit of this. Lumber and sawn timber have moved to an extent which is regarded as satisfactory, and prices have hardened. The demand for pitch pine has improved and prices are advancing. A large importation of pit-wood continues to be made, the extensive coal mining industry of Northumberland and Durham, like that of South Wales, appearing to be capable of absorbing unlimited quantities of wood and props for colliery uses. At West Hartlepool a notable improvement in the timber trade has taken place owing to the increased activity of timber using trade in the district. Waggon builders are making larger demands for oak and redwood, and ship builders are taking increased quantities of deals and battens for use in their industry, which is now active. At all of the ship building ports of the northeast, more timber is now being used, as builders are hastening construction, in order to make up as far as possible for the losses caused by the recent lock-out.

At Hull an improved demand for deals and sawn wood exists, the boat building and the seed and corn milling industries being more actively employed. At Glasgow business in spruce and general lumber has not been very active, but pitch pine, yellow pine of good quality, quartered oak, ash logs, and teak have sold to a fair extent. Hardwoods from Baltimore, lately to hand, sold readily and at very fair prices.

The pitch pine market may be spoken of as being very firm, prices having an upward tendency. Hardwoods have sold more freely. Waggon oak continues in good and steady demand, and stocks have lately been reduced. At Liverpool and Manchester the stocks of birch continue small, planks being practically exhausted. A good and steady demand for birch exists.

Railway Carriage Building.—The directors of the Great Western Railway Company have just received tenders for a supply of carriage timber, for their carriage building and repairing departments. The kinds of timber of which supplies were wanted were pitch pine, rock elm, oak logs, red and white deals, mahogany, walnut and wainscot oak. The invitations for tenders which the directors of the company issued to parties concerned, drew atention once more to a field of consumption of timber in the United Kingdom which has been attaining greater importance within the last few years, and which is now of first rank importance to timber merchants. The principal railway companies have steadily improved the character of their passenger coaches, until one hardly sees what further improvement could reasonably be desired. Since the introduction of corridor coaches, a much larger use of the more ornamental hardwoods by railway companies has developed. Oak still continues to be the chief framing timber, but of late the companies have used more costly oak, as they have used figured wood instead of comparatively plain wood. In most cases the

oak is now left as "show wood," and, being highly varnished, is a feature of the carriages. Mahogany and walnut are being used freely to obtain decorative effects, and, as highly polished, produce rich effects in the coaches. The practice of late has been to use these ornamental woods very freely, and a large consumption of them has gone on among the different railway companies in their eagerness to make their coaches more and more attractive to the public; in their evompetition with one another for traffic. The newer carriages of the London & North Western, the Great Eastern and the Lancashire, Yorkshire Railway Companies, are of an improved saloon type, and present relatively large areas of highly ornamental woods to view, and show an immense advance in design and finish. Elm and ash are also used for fittings of a non-decorative kind. The other woods, while giving the necessary strength, are made the most of for ornamenting purposes. The railway companies, consequently, form one of the more important bodies of consumers of oak, walnut, mahogany, elm and ash, now in the United Kingdom.

The Trade in Firewood.—This trade has developed considerably in the United Kingdom since it became evident that the public would buy "manufactured" firewood and fire lighters. Quite a large trade is now done in split wood, which is sold as "chips," and in fire lighters, of which several kinds are now being made. Some of the "lighters" have a big sale, and are very quick and effective when in use. Machines have been brought out for splitting the wood required for "chips" and for fire lighters, and are now used by some of the larger makers. Pitch pine and red pine are most prized, as the raw materials for fire wood, but are too costly to be bought new, and first hand, for cutting up and splitting. Odd lots or old wood are eagerly taken up by fire wood makers, but very little pitch pine, old or new, is obtainable. Next to pitch pine and red pine, comes yellow pine. This, of any quality or condition, so long as it is dry, is acceptable for making "chips" or fire lighters. There is, indeed, always a scarcity of good wood for fire lighting purposes, and fire wood makers have to use up anything, old or new, of the nature of wood, which they can obtain.

Montreal, March, 10.—Prices of timber in Montreal are largely governed by those of Ottawa and much of the lumber marketed here comes from the Ottawa valley. One dealer, speaking to the representative of the "Canada Lumberman" this week, about spruce, said there was no possibility of that commodity becoming a drug on the market. The Quebec stumpage dues have been increased forty cents per thousand and the regulations for cutting have been made more rigid. Smaller logs must be handled and limbs and brush must be cleared up cleaner than formerly. This means that a dollar a thousand more must be charged by the owners of limits to realize the same profits as before. Spruce mill culls are now quoted from actual contracts at $12.30 and $12.50 per thousand at the mill.

Lumber Insurance Company of New York Increases Capital to $500,000

The Lumber Insurance Company of New York, organized in 1904 with a capital of $200,000, will be enlarged to a company of $500,000 capital during the current year. At a recent meeting of directors the plan was put under way, and it will have final ratification at a stockholders' meeting to be held on March 16th. The Lumber Insurance Company of New York will absorb two smaller companies and with greatly increased reserve and surplus will come into the standing of a million dollar company.

The lumber specializing fire insurance business which saw its beginning in a small way within very recent years, has attained a great growth, and has extended into every section of the United States and Canada. The enlargement of the Lumber Insurance Company will enable it to keep pace with the growth of the business and stand in the forefront of specializing insurance companies.

The company is generally admitted under the insurance laws of most of the States, as well as in the provinces of Canada, meeting the heavy deposit requirements of various States and the Dominion of Canada, where a $100,000 deposit of Canadian bonds is maintained. The enlarged company will extend its business in an intelligent manner, putting its large facilities at the disposal of lumbermen wherever proper physical and moral conditions are maintained.

The Oshkosh Logging Tool Company, of Oshkosh, Wisconsin, have issued an interesting illustrated catalogue of construction tools, which will be of much value to those who are engaged in the handling of telegraph and telephone poles.

Quebec will Continue Pulpwood Export Prohibition

The policy of the Government of Quebec in connection with the export of pulpwood was outlined by Sir Lomer Gouin in a speech in the Quebec Legislature on March 10, when he was speaking in reply to a number of resolutions on the subject which had been introduced by Mr. Bourassa. Sir Lomer Gouin was not able to agree with all the resolutions brought in by Mr. Bourassa, but with the proposal that everything should be done which was possible, to encourage the making of paper in Canada, he was heartily in accord.

"It was with this object in view," he said, "and to develop industry in the province, that an order-in-Council was passed in April last year, to come into effect in the following September, decreeing that wood cut on Crown lands should not be exported unless it had undergone a certain degree of manufacture. We have learned from the newspapers, from commercial corporations, and from representative people that we were justified in that decision. What has been the effect of that order? The practical result is that increased capital is being invested in industry in the province, because we have some protection to give to that capital. We have seen the firm of Price establish a mill at Lake St. John, and Mr. Dubuc has stated that since the order-in-Council the mills at Chicoutimi and Metabatchouan have progressed in a marked degree, and it is intended to double and triple the production of these mills in the near future."

The Premier referred directly to the three foregoing instances of manufacturing development only, but generally speaking, he said there were more, and he quoted Senator Aldridge as having said that with the regulations as they stand in the Province of Quebec the United States manufacturer would have to come to Canada to prosecute his industry.

"It has been submitted," continued Sir Lomer, "that as pulpwood may be exported from private lands, our order will not be effective, but the advantage obtained through this exportation is very slight There are 10,678,931 acres of private lands whicetaoinhrdlucmfwyp There are 10,678,931 acres of seignioral lands and 11,354,000 acres of private lands which have been granted under letters patent and otherwise. Of these eleven million acres of private lands, six millions are forested. Deduct therefrom hard woods, timber destroyed by fire, the rocky grounds, the lakes, and the areas held exclusively for private use, and I do not think you will find more than three million acres of forest upon which the American can place his hands. This is less than five per cent. of the whole forest lands of the province, for we have under the Crown 117 millions of acres of forest. Therefore, I say the American manufacturer must establish his mills here if he wishes to keep up his trade."

The Premier showed that Quebec was not alone in prohibiting the exportation of its pulpwoods. Ontario had passed a similar order in 1900, British Columbia in 1906, and the Federal Government had enforced similar restrictions in Saskatchewan and Alberta in 1907. New Brunswick was about to adopt such measures when the question of the reciprocity agreement arose.

"And now it is being asked if, in face of what is proposed from Washington, we can go back on our decision last year prohibiting the exportation of pulpwood?" proceeded Sir Lomer. "It is pretended by some people that under the terms of the proposed agreement we should go back on that decision. But I have not heard anything yet which woud induce me to change that decision.

"The reciprocity discussion has been adjourned at Washington. It is going on at Ottawa, and we may await the result, but unless any one can advance other arguments to those which I have heard up to the present time, there will not be any change.

"I am in complete accord with the proposal to give every possible encouragement to the pulp and paper industry. Mr. Bourassa seems to think we should encourage the paper industry more than the pulp industry, but I have the opinion of Mr. Dubuc, and other specialists, who claim that the best thing for the province is the manufacture of pulp, because paper is subject to certain deterioration in transport."

Replying to Mr. Bourassa's demand for the separation of colonization lands from forestry domains, Sir Lomer said this policy had already begun; but as to the suggestion that lumbermen should be given a more absolute control over their forest lands, he asked if this would not be opening the door to Americans who would seek to get all the wood they possibly could from the private lands. There might be some good in granting some prolongation of title for the lumber merchants, but it was a little early to resolve the question in that way. Something in that direction was being done by fixing periods during which stumpage dues, rents, etc., are not disturbed.

Messrs. G. A. Grier & Son, Limited, Montreal, report a large cut of spruce logs this season and expect 150,000 pieces to arrive at Lachute as soon as the river becomes navigable for rafts. This timber finds ready sale on the American market and large quantities are shipped to New York in the shape of 2-inch by 9 inch plank, bringing $24 to $25 per thousand delivered.

The position of the spike, or other iron, in the log, in relation to the saw, often determines the extent of damage done to the blade. In a mill in the south a saw recently cut a railroad spike in two without losing a single tooth. Shortly afterward the same saw, at about the same feed, struck a big nail at an angle that turned every tooth for several feet, into the log. The blade ran in so heavily that the engine was stopped in two revolutions of the saw. The guides were strained badly and the saw itself almost ruined.

RUBBER BELTING

Mr. Millowner are you having belt troubles, if so you are not using Goodyear "Quality" Belt, and you are the man we want to get in touch with. Write us fully giving the size and speed of your pulleys and all the conditions under which the belt must work. We will then have our expert go over the information and quote you a price on a belt that we will absolutely guarantee to do the work required.

If you will give us an opportunity we will demonstrate to you that your best insurance against shut downs and long delays is "use Goodyear Quality Belt," every piece of fabric used in its construction is carefully tested and unless it comes up to our specifications it is instantly rejected. Only the highest grades of rubber are used and this makes it impossible for the layers to separate, and also insures a true, straight running belt. Write our nearest branch for further particulars.

National Wholesalers Hold Annual

The annual meeting of the National Wholesale Lumber Dealers' Association was held at Washington, D.C., on March 1 and 2, with a large and representative attendance.

President Higbie reported the organization to be in a healthy and good business condition. On the subject of hardwood inspection he said there are only two rules now in existence, and he hoped soon there would be only one, but that he was not prophesying. The association believed in uniform inspection, and a step in that direction would be followed to its logical conclusion. To-day the trade was nearer universal hardwood inspection than ever before. Regarding the reciprocity treaty, he thought the inevitable result would be to increase the supply of low grade lumber, add to the hardships and problems of the manufacturer, and make the price, already too low, much lower. No one class should be asked to bear the burden, which he thought, should be equitably distributed.

Secretary Perry characterized the last year as a most trying one. He said the association must place before its members all personal and general information possible, and that the trade relations established by the association were now generally understood. Trade advantages, he said, had been minimized and whittled away, but a channel had been hewn for righting trade wrongs. Much had been said and written, but little real information had been given concerning the "lumber trust." The National Association had been subjected to close examination the last few weeks, and he hoped for enlightenment when the final report was made.

The reports of Treasurer Cole and Auditor Cape were presented, and showed total receipts of $34,632 and total disbursements of $32,962.

The hardwood inspection report was presented by E. V. Babcock, of Pittsburg, Pa. The committee recommended one standard system of hardwood inspection. Mr. Babcock's position is nonpartisan. He asked for the appointment of a committee with a disinterested chairman and on it a member of each of both hardwood associations.

F. R. Babcock reported on the car stake litigation. He said nothing specific had been accomplished toward its objective. The committee had the amendment examined by an attorney, who stated that no substantial change in the rules had been made. He asked that the committee be continued, and thought the project could be prosecuted with better success and suggested that complaint again be filed, asking that carriers be required to furnish completely equipped cars. The committee was continued and the recommendations concurred in.

Mr. Henry Solon Graves, chief forester, addressed the meeting, saying that lumbermen should make forestry their problem because it was of more vital interest to them than to any other class in the country. The success of forestry was assured if a practical programme could be followed. He gave two fundamental principles of conservation of forests, the first being to secure general public benefits, the second, of greater importance, concerned the perpetuation of an adequate supply of forest products.

Hardwood association inspection and progress were outlined in addresses by Lewis Doster, secretary of the Hardwood Manufacturers' Association of the United States, and Fred A. Diggins, president of the National Hardwood Lumber Association. Each traced the development of his organization, showing work accomplished. Mr. Doster said the men of the South were heartily in favor of one system of inspection, and Mr. Diggins said he would surrender his job to bring it about.

Address to Forestry Students

At a recent meeting of the Foresters' Club of the University of Toronto, Mr. D. J. Turner, of the Turner Lumber Company, gave a talk on lumbering operations. Mr. Turner was one of the first Canadian lumbermen to realize the importance of scientific education as applied to his business. For the past three summers he has employed Toronto students on his limits, making logging maps, estimating timber, and locating roads, dams, camps, etc. He exhibited two maps made by students of the forestry faculty, and said they were invaluable to him. He considered the trained forester to be a necessity to any enterprising lumber concern, and believes in giving the students a chance to train themselves for scientific lumber production. He said it would pay any company to employ these men, even if they only made accurate maps of limits. Mr. Turner gave a brief but comprehensive outline of the work of a lumber company from its organization to the milling of the logs, and the sale of lumber, and later spent an hour answering questions from the students and members of the faculty.

Serious Accident to Lumberman

Here is a choice bit of literature from an Ontario newspaper, whose editor seems to have been overpowered by the tragedy of fthe destruction of the forests in his native neighborhood. We reproduce it in its own simple beauty of phrase, for the benefit of those who appreciate expressive language, and of those who look with sorrow upon the depletion of our virgin forests. We would wish to know more, however, about the result to the Mr. Nichols who was the victim of the editor's carelessness.

The article is as follows: "Carleton Place, Ont.—During the past winter W. A. Nichols has purchased logs quite extensively—ash, hemlock, basswood, and pine. From the Dalhousie farmers he secured 10,000, all placed by them on the Mississippi, to come to the mills here by the old-fashioned method of a drive. The cash left up there was more than $7,000. From the farmers around home he picked up 4,000, Adam Dunlop alone contributing 1,000. There was a monster pine on Mr. John Hands' farm in Drummond, which for half a century defied alike the gold of the lumberman and the gales from heaven. It fell the other day into the lap of Mr. Nichols. It was, truly, a giant 99 feet in commercial length, and 40 inches at the stump. It produced five logs fourteen feet long, one log sixteen feet, and one thirteen. This noble pine, towering high above the surrounding forest, could be seen for many miles, and was a landmark, its removal like the fall of a piece of cherished scenery out of the landscape. Mr. Nichols' sawmill here puts about 100 logs a day into lumber."

Ontario Pulp Wood Exports to the U. S.

According to a bulletin recently issued by the United States Census Bureau, Ontario continues to hold its own in regard to pulpwood regulations, and is in a very strong position. The bulletin contains a statistical statement of the consumption of pulpwood and the production of wood pulp. In 1909 the consumption of pulpwood in the United States was 4,001,607 ocrds, which was an increase of 19 per cent. over the amount used the previous year. In order to meet the requirements in the United States the consumption of pulpwood is twice what it was in 1900. In addition to spruce and poplar, a great many other kinds of wood are being used in the production of pulp, including white fir, which previously was considered of little or no value for that purpose, with the result that the average yield of pulp per cord of wood consumed has decreased from 1,286 pounds in 1907 to 1,245 pounds in 1909. New York State consumes more pulpwood than any other, and of the amount used there 44.3 per cent. was imported spruce. In 1909 the state imported 408,719 cords of pulpwood, while the consumption of domestic wood amounted to only 384,883 cords. The total output of wood pulp in the United States in 1909 was 2,491,406 tons. The total imports were, in 1910, 423,721 tons, valued at $11,768,014. In 1906 the pulpwood imported into the United States was $4,500,000, in 1907 more than $6,000,000, in 1908 more than $7,000,000, and in 1909 $8,629,263. The value of imports from Canada during the five years has shown the following increase: In 1906, $2,503,362; 1907, $3,230,272; in 1908, $3,198,223; in 1909, $3,407,715; in 1910, $4,226,560. In 1909 more than 95 per cent. of the imported mechanical pulp imported by the United States came from Canada.

B. C. Will Safeguard Health of Lumber Jacks

The B. C. Government contemplates the adoption of measures to provide for the better safeguarding of the health of the men employed in railway construction work, logging, mining, fishing and similar camps, saw and shingle mills. Under the Public Health Act as at present constituted, it has been found impossible to systematically keep track of sanitary conditions in the various camps and mill quarters, the result being that serious outbreaks of disease have occurred in various parts of the province from time to time, the general public being exposed to infection owing to the migration of men from the camps thus attacked. The new legislation provides for the appointment of a staff of inspectors, presided over by a chief inspector, who will periodically inspect all camps and mills. The inspector will have power to rectify all complaints made either by the men or the employer, and may arrange for medical attendance when necessary. The good effects of this measure will speedily be made apparent.

P. W. Gardiner & Son, sash and foor manufacturers, of Galt, Ont., have lately issued their catalogue and price list for the season. Their hardwood veneer door catalogue, in which line this firm specialize, is one of the most up-to-date of its kind issued. Printed on high grade paper, it shows the various styles of doors in their natural finish and color and gives the prospective buyer a splendid idea of the work turned out by this well known and long established firm.

The date of the annual meeting of the National Lumber Manufacturers' Association has been changed from May 3 and 4, to May 24 and 25 next. One of the reasons for the change is that more pleasant weather is likely to prevail at the latter date, and is in the interest of the ladies whom it is hoped will be present in full force, accompanying the delegates and other visitors.

The death occurred recently at Ottawa of Mr. J. J. Gormully, K.C., solicitor and director of the E. B. Eddy Company, a well known and highly respected resident of the capital. His death was the result of rapid pneumonia.

CONGO

NEVER LEAK ROOFING

Congo on Armour's Fertilizer Works, Buena Vista, Va.

Guaranteed Till 1921

THE year 1921 is a long way off, but a Congo 2-ply Roof laid in 1911 will be still in good condition then.

We don't merely *say* that Congo will last ten years; we *guarantee* it.

Our guarantee is not a mere formal "We-say-so"; it is a genuine Surety Bond issued by the National Surety Company of New York.

We can't do more than that to assure you that Congo really will last ten years.

When a man buys Congo he buys 10 years of protection.

Congo is easy to lay. Nails, cement and rust proof galvanized iron caps free in centre of each roll.

Copy of 10 year Guarantee Bond and further information on request.

Congoleum We should like to send every reader of this paper a sample of Congoleum for Flooring and Wainscoting. It is fitted for use in homes, stores and offices. It is a perfect imitation of light and golden oak. Its surface has a high polish. It is unusually durable. The price is very low. Samples and further details mailed free on request.

EDGINGS

Ontario

Geo. Voght, Adamsville P.O., Ont., is adding a new lath mill and bolter to the equipment of his mill, for the purpose of working up the refuse.

Nelson & Cassaday, timber dealers in the Rainy River district of Ontario, have this winter taken out 150,000 telegraph poles for the Canadian Northern.

J. R. Booth, Ottawa, is erecting a new building above the Chaudiere Falls near the dam, in which saws will be installed and pulpwood sawn into the required lengths as soon as it is taken out of the water.

Arrangements have been concluded with the London & Southwestern Bank, Limited, of London, England, for an issue in London of $1,300,000 of the 6 per cent. first mortgage sinking fund gold bonds of the Spanish River Pulp & Paper Mills, Limited.

The sawmill and basket factory of William Flaters, at Rodney, Ont., was completely destroyed by fire on March 5. The loss is $3,000, with no insurance. It is believed that the fire was started by tramps who were sleeping in the upper storey of the mill.

The Ludlam-Ainslie Lumber Company, Limited, are moving their planing mill from Sarnia to Hamilton, where a large brick structure is nearing completion for their reception. They will be in full running order in Hamilton about the middle of April.

A Fort Frances, Ont., report says: It is now certain that Backus & Brooks will build their sawmill across the river just east of International Falls. This is a better site than the one originally chosen, closer to that town, as they will have more room for yards and mill purposes. The next few years will witness a great change in this section and more noticeably in Fort Frances, which is bound to become one of the large lumber manufacturing cities of Ontario.

Contractors in the woods of New Ontario and Manitoba this winter report a very busy season, eclipsing all former records in the quantity of ties, timber, poles, posts, cordwood, pulp and logs which have been cut. From 15,000 to 20,000 men have been employed at this work continuously, and over $500,000 paid in wages. At Fort Frances the estimated cut of pulpwood is 200,000 cords, this large amount being due to bush fires which swept throughout Rainy River country last fall. The number of ties cut will reach nearly 4,000,000 in the several camps located along the Canadian Northern and Canadian Pacific Railways. Telegraph and telephone poles will reach nearly 250,000, while the logs cut for lumber companies will reach 150,000,000 feet.

The work of regulating the flow of the headwaters of the Ottawa river, which has been in progress two years, will be continued throughout the coming summer. The Department of Public Works will issue a call for tenders for the construction of the dam at Quinze lake, the estimated cost of which is $59,000. The dam will be located 18 miles from the head of Lake Temiskaming. The dam at the foot of Lake Temiskaming has been completed and will control 27,878,400,000 cubic feet of water. The dam at Kippewa is under construction. Tenders will be called this spring for the new dam at the head of Gordon creek. The construction of these dams is expected to control the regulation of the water in the Ottawa river and to prevent for all time the periodical spell of low water.

A New Liskeard, Ont., despatch says: As a result of the visit of Mr. McLelland some weeks ago, in the interests of Toronto capitalists, to investigate the timber resources of this district with a view of establishing a large woodenware industry, Mr. Clarkson, a timber expert, has been travelling through the country for the past ten days on a timber inspection tour both in Ontario and Quebec. If a supply of ten million feet per year is guaranteed, a large industry will be established somewhere in the district, the exact location of which will not be decided upon until the ice breaks up. This industry will give employment to approximately one hundred men the year round, manufacturing from the log, and will also be the means of opening up a splendid market for the many small sawmills in the district in disposing of their output of lumber. The parties interested are favorably impressed with New Liskeard as a site. The articles to be manufactured will be for export trade.

Eastern Canada

E. Hurtubise, lumber dealer, Grandes Piles, P.Q., is stated to have assigned.

The St. George Pulp & Paper Company, of Hudson Falls, N.Y., operating in Charlotte county, N.B., is preparing to file articles of incorporation, with a capitalization of $460,000.

The Owens Lumber Company, Limited, Montebello, Que., has been incorporated with capital of $100,000. The incorporators are: N. Dickson, notary public; A. Holden and Jas. Buchanan, accountants, all of Montreal.

E. J. Maxwell, Limited, Montreal, capital $100,000, have been incorporated to carry on the business of lumbering, etc. The incorporators are: G. W. Macdougall, K.C.; Lawrence Macfarlane, and C. A. Cartwright, accountant, all of Montreal.

A despatch from Campbellton, N.B., states that fire recently destroyed one of the Dalhousie Lumber Company's logging camps on the Intercolonial Railway line and that James Adams, aged 24, the camp cook, was burned to death.

Shortly after noon on Sunday, March 5, fire caught from a defective flue in the office of the Woodstock Woodworking Company, adjoining the factory, at Woodstock, N.B. The firemen responded promptly and succeeded in preventing the flames from spreading to the factory. The office and wareroom were completely destroyed, together with a stock of mouldings, sashes and doors, valued at $4,000. The building was insured for $200 and the stock for $4,000.

A proposition to lease the Mispec pulp mill for $2,000 per year, with the option of purchasing the property for $20,000, was made to the Water and Sewerage Board of St. John, N.B., by Stetson, Cutler & Company at a recent meeting. As the mill was bought by the city to escape liability for damage to water rights by the damming of Loch Lomond, the city will not consent to any proposals involving water rights. The matter was therefore referred to the Recorder to see if this difficulty could be overcome.

The negotiations carried on by Donald Fraser & Sons, of Fredericton, N.B., for the purchase of the timber limits and mills at Edmundston, N.B., of James Murchie, Sons & Company, of Calais, Maine, have been completed. The timber limits consist of property about 22 miles long and 6 miles deep, part on the Madawaska river, and part on Lake Temiscouata. The mill at Edmundston is of large capacity, and one of the finest in the northwest section of the province. It employs about 60 men. The price paid for the property is not publicly stated, but is generally believed to have been in the vicinity of $300,000.

The Canadian Stewart Company, Limited, general contractors, of Montreal, have been awarded the contract for the power development and the construction of pulp mills and paper mills for Messrs. Price Bros. & Company, of Quebec, P.Q. The plant is to be erected at Jonquiere, Que., at the confluence of the Saguenay and Aux Sable rivers, ten miles from Chicoutimi. While no details are obtainable as yet, it is understood that the plant will comprise about twenty buildings and will cost upwards of two million dollars exclusive of machinery. The firm of Geo. F. Hardy, architects and engineers, of New York, are preparing the plans and specifications.

The present season is reported to have been very favorable for lumbering operations throughout eastern Nova Scotia. The small insdutries have been especially active and at numerous points along the I.C.R. large piles of logs may be collected which, later on, will be cut by portable mills and shipped to the market by rail. In many parts of the country where it was supposed that all available timber had been cut, large lumbering operations are being carried on. In Victoria county, Cape Breton, the Founds Brothers have been operating three camps at Middle River and will put in a cut of several millions. This lumber will be driven to Nyanza and cut and shipped at that point. Last year a large part of Messrs. Founds' cut was marketed at Sydney and other eastern Cape Breton points. At present everything points to an active industrial season during 1911.

Western Canada

The Peace River Lumber Company, composed of American capitalists, will erect a mill at Fort George.

Lindsley Bros., of Spokane, who have their registered office in Nakusp, B.C., are extending their operations. They get out telephone and telegraph poles.

The International Lumber & Implement Company has bought a site in Moose Jaw, Sask., for an extension of its lumber yards. It is the intention of the company to extend its business on all branch railway lines running out of Moose Jaw.

The Abbotsford Timber & Trading Company, of Abbotsford, B.C., is preparing to open up a lumber yard on a new site prepared some time ago, along side the electric railroad. Mr. Thos. Kirkby will be placed in charge of the business as local manager. They will also erect a large warehouse and office building.

Those interested in the Diamond Mills Company, which will establish head offices at Revelstoke, B.C., are C. D. Danaher, Tacoma, president; F. C. Adams, Duluth, vice-president; Charles A. Barnum, secretary and manager for British Columbia. Mills are already operated at Boundary and Arrow Lakes, and another will be erected near Arrowhead.

During the month of February, the receipts of the timber branch of the B. C. Department of Lands aggregated $206,327.55. A total of 922 timber licenses issued for lands west of the Cascades produced $130,573.15 in revenue, while 565 such licenses brought to the treasury $66,944 40. Penalties amounting during the month to $1,050, and timber license transfers to $515. The balance came from coal licenses.

F. L. Buckley, managing director of the British Canadian Lumber Company, loss is figured at $10,000. Mr. A. D. McRae, vice-president and general manager of the company, who was recently in Toronto, stated that he had not received any word of the fire, and therefore did not suppose that it was very serious. The building destroyed would probably be the shingle mill, which is located across the river from the company's large sawmill.

A Winnipeg syndicate, headed by J. D. McArthur, railway contractor, has acquired the assets of the Fort George Lumber & Navigation Company which recently went into liquidation. The holdings include two sawmills at South Fort George; three steamboats and automobiles, the latter dunning in summer time between Ashcroft, on the C.P.R., and Soda Creek, at the head of navigation on the Upper Fraser. It is understood that a new company will be incorporated at once and that a vigorous policy in connection with the development of northern British Columbia will be inaugurated. The associates of Mr. McArthur include Dr. J. K. McLennan, A. J. Adamson and J. A. Thompson, all of Winnipeg.

The plant of the Dominion Tar & Chemical Company, near Winnipeg, Man., is nearly completed. When in operation it will have cost about $200,000. Manufacturing operations will commence in a few weeks. The work of the new concern will consist wholly of creosoting wood for preservation purposes. Already they have several extensive contracts from Canadian railways to treat railroad ties in this manner, and this will be the first work undertaken. There is enough work ahead to keep the plant working continuously for many months. In addition to ties, the firm will treat piles, timber, paving blocks, and other classes of wood. The creosote will be distilled from coal tar on the ground, and the method employed is to force it into the timber under pressure. F. W. Coates is manager of the new concern.

A Nelson despatch states that the capacity of the Canyon City Lumber Company's mill will this year be increased to about 40,000 feet per day. The past winter has been an exceptionally favorable one for logging operations, says Mr. D. W. Briggs, president of the company. "The mill was in operation all the winter and we made a good cut. The snow was just right for hauling logs in the woods. The roads were in fine condition all the winter." The Canyon City Lumber Company's mill, of which C. O. Rodgers is manager, has at present a capacity of 30,000 feet per day, and was built in January, 1910. With certain improvements to machinery this capacity will now be increased to about 40,000 feet per diem. With regard to the prospects for the coming year, Mr. Briggs said: "They are excellent. Orders have already commenced to come in from the consumers on the prairies in a volume that speaks well for the coming season's business." The Canyon City Lumber Company is equipped with the only caterpillar engine in the country. This is a new form of traction which, by means of a form of belting on the wheels, can travel successfully over soft snow or over marshy land.

Trade Enquiries

The Dominion Government Trade and Commerce reports contain the following trade enquiries. Readers of the "Canada Lumberman" may obtain the names of enquirers by writing us, enclosing stamped envelope, and stating number of enquiry.

243. Wooden boxes—A London firm seeks supplies of wooden boxes for packing purposes, and would be pleased to receive quotations from Canadian manufacturers.

278. Maple flooring—A large firm of flooring specialists in London, England, is anxious to get into touch with Canadian exporters of maple flooring.

283. Rock maple logs.—An export forwarding firm in New York City wishes to get in touch with exporters of rock maple logs in the Province of Quebec.

290. Maple flooring strips and blocks.—A London manufacturing firm who buy large quantities of maple flooring strips and blocks invite quotations from Canadian manufacturers who can fill orders.

KEBO
BALATA BELTING

is recommended in preference to all other belts for its

Perfect Uniformity
Exceptional Strength and Durability
Straight and Steady Driving

Every Belt is thoroughly stretched and seasoned before being sent out and is fully guaranteed.

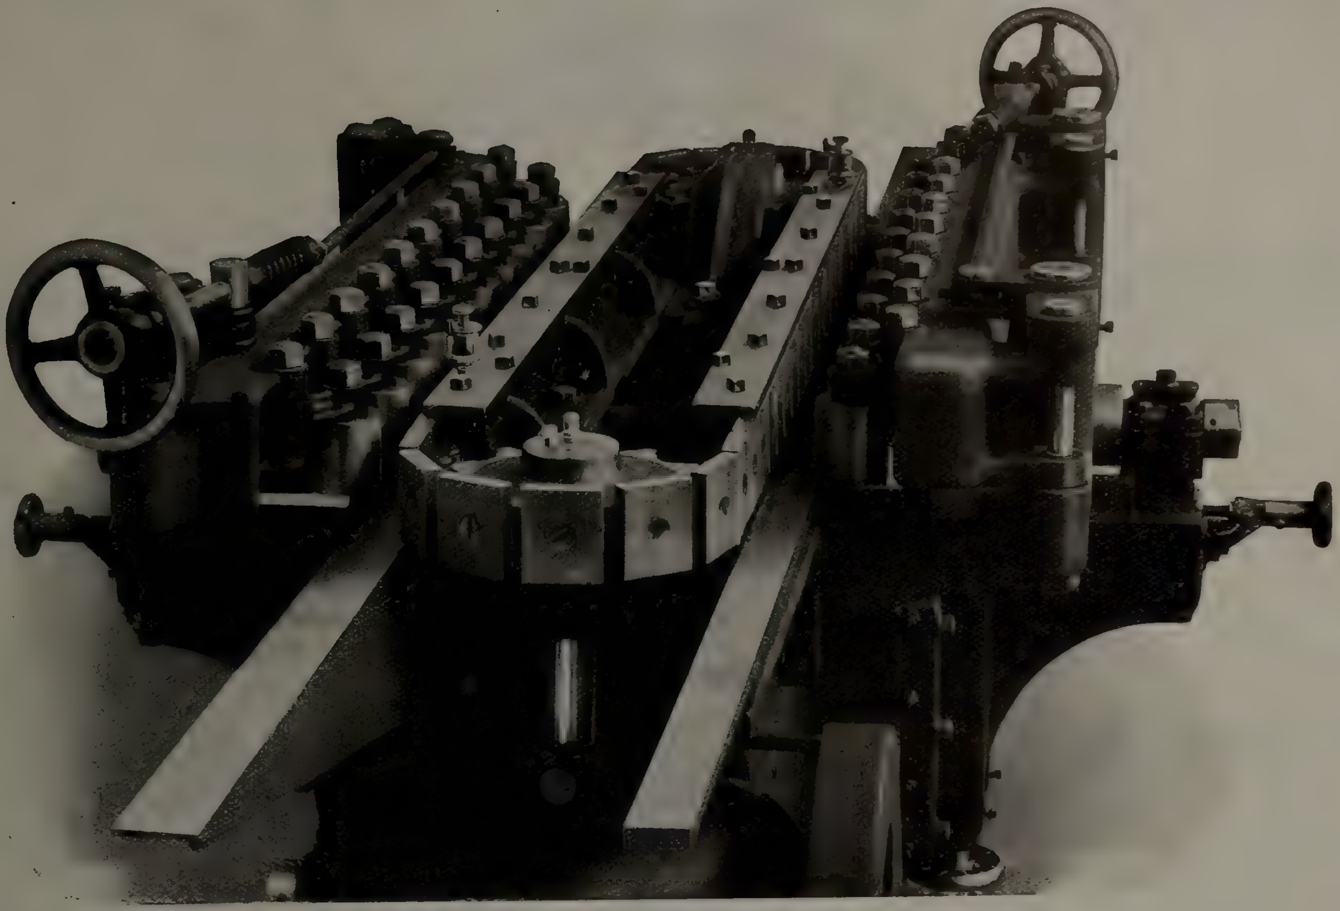
Berlin No. 213 Glue Jointer



Your Conception of a Glue Jointer

There was a time when we didn't make a glue jointing machine.

During a conversation between one of our branch office managers and a furniture man who had bought several of our sanders, the later stated that he had just bought some new machines.

Their conversation follows :

"What did you buy?"

"A couple of glue jointers from So-and-So."

"Do they make a good machine?"

"Oh, as good as any. But, do you know, none of them are what I want. Why don't you people make one."

"Tell me what you expect of it, and perhaps we will."

"Well, I want a machine first, that will handle short stock up to, say, six feet long and handle it four or five times as fast as we can handle it on a hand feed machine. Next, I want a feeding mechanism that will be absolutely positive, that will hold the stock firmly so it cannot slip backwards, jump forward or raise up. Then I want the working parts accessible and some sort of a lever so the machine can be started and stopped instantly from the in-feeding end.

"Now, if you will make such a machine and mount it on a one-piece base to prevent vibration, you can have my order for several."

Isn't that **your** idea of what a glue jointer should be? It describes, with one exception, our No. 213.

The exception is this :

Instead of an output of four or five times as great as a hand-feed machine, our No. 213 has an output **eight times greater.**

The automatic feed makes this possible. It is the one feeding mechanism which provides maximum output yet is absolutely accurate and positive.

Every provision is made for making quick adjustments. A lever at the in-feeding end starts and stops the feed. The cutter-head carriages are adjustable in three directions, providing for perfect alignment with the feeding mechanism.

The four-page folder of the No. 213 goes into detail regarding construction, and contains several pictures. Send for a copy—**to-day**—and learn how to cut your glue-jointing costs.

No. 184 Four-Side Molder.

Notice the extension of the base, forming an outside bearing for the upper head and eliminating overhang of the lower head.

Molder-Value is Measured by the Quality and Quantity of Output

The best results can only be attained by using the best Molder the Market affords—a Molder that is as near perfect as human ingenuity can make it—a Molder that has stood the test.

We have been building Molders for eighty years - you have the reputation and guarantee of the world's largest manufacturers of high duty woodworking machinery back of the assertion that the latest models of Fay & Egan Molders are in advance of any other make now on the market. You also have the verdict of the most discriminating buyers, such as the Otis Elevator Co., Pullman Co., Illinois Central Ry., Sante Fe System, International Harvester Co. and many others, who have bought and still continue to buy our Molders in preference over all others.

LASTLY—our Molder catalog goes into the details of our complete line of high duty Molders—showing that our machines have all the points claimed by other manufacturers, many features exclusive in our machine and that built-in quality that is absolutely necessary in making a good Molder. This catalog gladly mailed free of charge upon receipt of your request.

Order Your GANG SAWS Early

This is the time of year when mill men begin their repair work for the coming season. Better order your Gang Saws right away and order them from us because

We specialize in the Manufacture of GANG SAWS

The **Steel** that is used in our GANG SAWS is manufactured especially for these Saws on account of its **Toughness, Durability** and the length of time it keeps its **Keen Cutting Edge.**

By using our GANG SAWS you will NEVER have any trouble with the corners of the teeth breaking off when swaying.

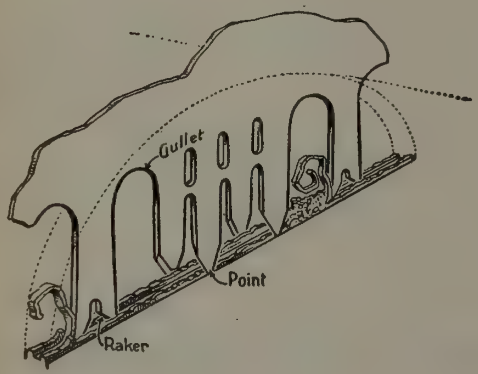
The above qualities are the most essential points in GANG SAWS.

Before placing your orders write us for further information and prices.

We manufacture all kinds of Saws, and solicit your enquiries.

R. H. Smith Company Limited

St. Catharines, Ont.



Why Atkins Sterling Saws Run Free and Easy

Saws that depend on "set" for clearance have to tear their way through the timber, like the picture to the left. The teeth are sprawled out on either side and chatter and stick and bind and tear. That's why wood sawing is sometimes considered such hard work. That's why commonly ground saws can NOT run fast or pull easy.

ATKINS SEGMENT-GROUND CROSS-CUT SAW BLADES are ground thinnest on the center of the back. The teeth are the widest part, and the blade drops easily into the smooth cut which is made by the saw teeth. Very little set makes the teeth cut clean and the rakers clear the center. See the picture to the right. These Saws merely require enough power to pull them back and forth. That's why they run so easily.

ATKINS STERLING CROSS-CUT SAWS are the only Saws that are Segment-Ground, and for this reason are guaranteed to run easier and cut faster than any other Saws. Write us for free information, or order through your jobber or dealer. If they won't supply you, let us know.

Isn't it Better to Investigate

"The HOWARD" Vulcanizing Process

than to wish you had

Positively the quickest and most economical system known for drying and Preserving Lumber, Railroad Ties, etc.

POINTS IN ITS FAVOR:

Does away with all kilns
Improves quality of all lumber
Increases the crushing strength
Increases the transverse strength
Reduces the weight 30 per cent to 45 per cent
It materially prolongs the life of wood
Eliminates shrinking, swelling and warping
Emphasizes and beautifies natural grain of the wood
Makes fit for commercial use woods not otherwise merchantable
Does away with necessity of maintaining heavy stock of lumber in yards
By this process green lumber taken from the log can be used for building purposes in 2 or 3 days

We invite Lumbermen and Owners of Woodworking establishments to see a practical demonstration of the process at our plant in Toronto

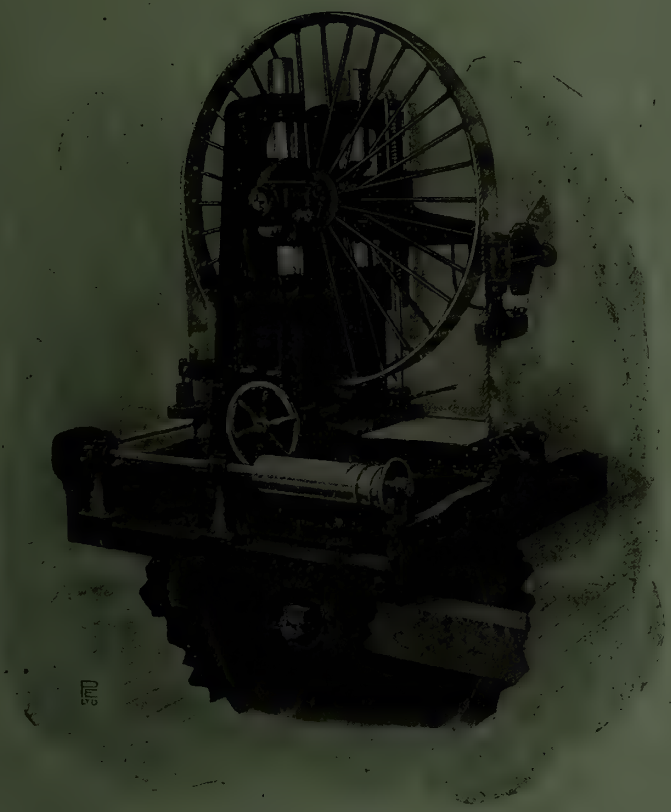
The "New Model" Bandmill

"A new Bandmill that is new—and why"



The Waterous "New Model" Bandmill was designed and first built in 1909.

Previous to this we had been building the old Allis Mill, redesigned, altered and improved from time to time to keep pace with changing sawmill conditions. Although successful in every sense of the word and turning out good lumber and lots of it, a number of features that we knew would materially improve it could not be satisfactorily embodied in the old design. We therefore discarded the old patterns and produced a completely new mill.

Getting down to brass tacks, a good Bandmill consists of three essential parts on which its efficiency and cutting capacity really depend :—two properly designed, properly supported wheels that will carry the saw—a device for keeping the saw in right tension to hold it in position against the feed—and a suitable guide to prevent it from crowding in the cut.

These three essentials were carefully considered when designing the "New Model" Bandmill. The old wheels, which had proven practically perfect in weight proportion and in smooth running qualities, were left unchanged, but a radical departure was made in the manner of their support.

The mandrel bearings throughout were increased in weight and length. The columns were redesigned to hold the bearing supporting posts above and below the mandrel, and were extended back to give a much larger bearing on the mill bed. With this construction both wheels are held steady and rigid in absolute line without vibrating when doing the heaviest work.

The straining device was replaced by one that is second to none. Every fulcrum point is knife edged, and tension weights are carried upon cushioning springs which absorb sudden shocks and jars that might affect the saw. One customer writes "I have cut over 20,000,000 feet this last season, and with your new Bandmill have not broken or cracked a saw"—does this count with you?

We were the first to produce a saw guide that by swinging about the centre of the saw blade made double cutting on a rigid mill possible. This guide in a simplified and improved form was incorporated in the "New Model" Mill.

The graceful business like design of this Mill is well shown in the attached cut of the 8 ft. Double Cutter. This size Mill will carry a 40 ft. saw with a 14 inch blade. We also build 9 and 10 ft. sizes.

Our 20 page bulletin No. 102 fully describes and illustrates these machines. Ask us to send you a copy.

Montreal Toronto St. John, N.B. Winnipeg Calgary Vancouver

One setter can work all day with this machine

With a steam set works you do not have to change setters every three or four hours, or every half day. One man can work all day because the hard work is done by steam.

And you get better lumber, because the travel of the piston is as exact as in a steam engine, so that a steam set works of itself simply cannot cut uneven lumber.

Further, you get more lumber, because it will set up to four inches as quickly as any other machine will set two inches.

Let us send you further particulars.
